Millions struggled to make ends meet as improvements in maternal and children's health declined and then ultimately reversed. By 2003, the infant mortality rate hit 16.5 per 1,000 births (CDG 2015). To address the growing infant mortality rate, Plan Nacer was rolled out in 2004. Plan Nacer was funded through a collaboration between the government and the World Bank. It incentivized public providers to achieve health outcomes, while provincial health staff encouraged delivery of effective services. Research found that from 2005 to 2008, the plan reduced the risk of neonatal death by 74 percent, preventing 773 deaths (CDG 2015). The program began in the northern provinces with the highest mortality rates, and beginning in 2007, it spread across the country until achieving national coverage by 2012.

Mothers in Argentina receive 90 days of paid maternity leave through an employer-funded system. While on leave, they are paid at 100 percent of their salaries (SIGI 2016).

Despite improvements such as those gained through Plan Nacer, stagnant maternal mortality rates have been tied to lack of access to abortions (CEDAW 2016). According to the most recently available Department of Health information, abortion-related deaths are the leading cause of maternal mortality in Argentina (SIGI 2016).

Reproductive Rights

Abortion is illegal in Argentina. Exceptions are permitted in cases of rape or when the woman's life is at risk, but even in such cases, women and girls face numerous barriers to obtaining an abortion. The Supreme Court issued a landmark ruling in March 2012 that removed the need for prior judicial authorization for abortions following a rape. The ruling further charged provincial governments to develop a protocol for ensuring access to legal abortions under these circumstances. As of March 2015, the Association of Civil Rights found that over half of the country's 23 provinces had yet to adopt processes that complied with the court's ruling (HRW 2016).

Argentina has struggled to enact a law that decriminalizes abortion and puts the topic of sex in the public eye. This situation has made it so that women and girls are often criminalized for undergoing an abortion. The Catholic Church's influence is present in many aspects in Argentina, including women's reproductive health. Some argue that the Catholic Church's stance on women's reproductive health is conservative, patriarchal, and oppressive and that it negatively affects women's access to contraception and

6 Argentina

their reproductive rights overall. Catholic organizations have attacked nongovernmental organizations (NGOs) who aim to improve women's access to their reproductive rights. Feminist activists established Catholics for the Right to Decide–Argentina (CDD) in an effort to work toward laws to protect women's reproductive rights. CDD-Argentina challenges the Catholic Church's conservative stance on issues such as contraception, LGBT rights, and abortion and works to build the capacity of professionals in various sectors—health providers, journalists, and lawyers—to become advocates for sexual and reproductive rights (Cavallo 2016b).

CDD-Argentina was instrumental in fighting the conviction of a young woman known as Belén who had been incarcerated and criminalized for an abortion. Belén was sentenced to eight years in prison following what she claims was a miscarriage of an unknown pregnancy and what both the hospital and courts claim was an induced abortion. CDD-Argentina alongside 40 other groups organized activities that ranged from social media campaigns to street protests to demand freedom for Belén (Cavallo 2016a). On August 17, 2016, the Supreme Court of Argentina's Tucumán province granted Belén's release; however, her struggle is not over, as the court is still deciding whether her case will be overturned.

The 2002 passage of the National Law on Sexual Health and Responsible Procreation ended an 11-year ban on the use and sale of contraceptives. This legislation focused on providing universal access to contraceptives and information on reproductive health. Despite this legislation, reports about access to birth control conflict. The Argentine government is required to provide free contraceptives, and an estimated 64–70 percent of women use modern contraceptive means (U.S. Department of State 2015). Conversely, Human Rights Watch (HRW) reports that women often have trouble accessing reproductive services, and barriers to access can result in women and girls facing unwanted or life-threatening pregnancies and are then subject to criminal prosecution for seeking abortions (HRW 2016). While Argentina has a system for ensuring accountability, it is rarely used to benefit female reproductive health.

Health Education

The Reproductive Health Education Law passed in 2006 established that all students have the right to fundamental reproductive health education in both public and private schools across the country. The National Program for

Integral Reproductive Health Education was subsequently developed to oversee compliance with this law to ensure the incorporation of precise, trustworthy, and updated learning on reproductive health education; promotion of responsible attitudes toward sexuality; prevention of general and sex-related health problems; and equal treatment and opportunities for boys and girls (UNESCO-IBE 2008). This law was one of several sexual health policies passed during the first decade of the 2000s; however, these laws and programs are spottily enacted (HRW 2010). On paper, Argentina has a comprehensive reproductive and sexual health program, but, in reality, these services are often unavailable or of poor quality (Cavallo 2016b).

Diseases

Women tend to outlive men. In 2016, the life expectancy for women was 80.4 years, compared to 74 years for men (CIA 2017). Cardiovascular diseases are the leading cause of death for men and women. In 2012, ischemic heart disease killed 49,900, and hypertensive heart disease claimed another 8,900 (WHO 2015b).

It is estimated that 110,000 people are living with HIV/AIDS, 60 percent of whom are aware of their status. Among other sexually transmitted infections, maternal syphilis is the most prevalent at the national level (WHO 2015c). Indigenous peoples experience lower levels of economic and social development and higher than average rates of chronic disease (U.S. Department of State 2015).

Zika is a vector-borne disease reported in many southern countries, including Argentina. As of December 2016, there had been more than 1,821 suspected cases and 26 confirmed cases of Zika. Seventy-three suspected cases in pregnant women were reported to the Ministry of Health; 5 were confirmed. One case of congenital syndrome associated with Zika virus infection was reported in Tucumán province (PAHO 2016). Zika is not the only virus transmitted by insects. A total of 268 cases in 16 Argentine jurisdictions of dengue and other arboviruses were reported. Persistent communicable diseases include Chagas, tuberculosis (TB), and leprosy. Visceral leishmaniasis is gaining a foothold, dengue is spreading, and yellow fever is regionally confined to the provinces of Corrientes and Misiones (WHO 2015c).

Alcohol and Tobacco

Alcohol and tobacco use are more common among boys and men than women and girls. The 2010 per capita

consumption of alcohol for women was 10.9 liters and 19.5 liters for men (WHO 2015a). Binge-drinking rates demonstrate an even larger disparity between men and women. Among regular drinkers, 34.2 percent of men engage in heavy episodic drinking compared to 1.7 percent of women. At every phase of life, apart from late adolescence, males use tobacco at a higher rate than females. Seventeen percent of boys aged 13–15 smoke cigarettes compared to 20.5 percent of girls (WHO 2015d). It is too soon to know the full impact that increased smoking among adolescent girls will have, but known health risks related to smoking make this a potential cause for concern.

Employment

As of 2015, roughly 48 percent of women participated in the workforce, compared to 75 percent of men (UNDP 2015). Women hold 53 percent of professional and technical positions (WEF 2016a). Argentine women also commonly perform low-paid domestic work and other labor in the informal sector. Of the total labor force, 18.35 percent are female domestic workers (UNDP 2015).

The law prohibits discrimination with respect to employment or occupation because of race, color, sex, religion, political opinion, national origin or citizenship, social origin, disability, sexual orientation or gender identity, age, language, and HIV-positive status or other communicable disease. Additionally, laws support equal pay for equal work and equal opportunities for promotion in the workplace (SIGI 2015). Despite these laws, women continue to face economic discrimination in employment. Women hold a disproportionately higher number of lower-paying jobs and significantly fewer executive positions in the private sector, and they earn approximately 55 percent of what men earn for similar or equal work (U.S. Department of State 2015). Gender and age are the most common types of workplace discrimination.

Family Life

Family plays a major role in the social structure. Grandparents often live at home, and extended family members typically live nearby; families tend to be very close and affectionate. Beginning in the mid-1970s, a deep economic crisis led to a recession that affected men and women differently. More women entered the workforce, and men experienced an increase in unemployment.

Women's legal status within the family and society has improved due to changes in the legal system. Women have legal inheritance rights and equal access to land-ownership under the Civil Code and the Constitution, respectively. The legal age to consent to marriage is 18. Divorce was banned during the colonial period but has been legal since 1987. There was a 10-month period in 1954–1955 when it was granted under limited circumstances. Divorce remained culturally stigmatized in part due to the influence of the Catholic Church. Between 1871 and 2012, Argentina operated on the same civil code, with minimal revisions. A new civil code, which sought to address current realities, was adopted in 2012 (Protopapas 2012). Access to divorce at the request of either party and without steep financial penalties is one outcome of the new code.

Family dynamics in the 20th century brought changes to the nuclear family. Many women are now having children outside of wedlock and in one-parent households. Some even say that they have had fake wedding parties for the experience of a party without the legal commitments. María Mercedes Vittar from Argentina states, “We are the families of the future” (Garcia-Navarro 2015). Among the young, single men tend to live by themselves, and among the elderly, it is more common for separated women and widows to do so.

Gender roles vary vastly by region and across ethnicities; however, in the postcolonial context, male dominance and superiority, also known as *machismo* in Spanish, has a strong influence on how young girls view themselves and their roles in society. Generally, women are responsible for fulfilling a nurturer role, with a focus on such domestic duties as food preparation for the whole family.

LGBTI Rights

In 2010, Argentina became the second country in the Americas (preceded by Canada in 2005) and the first Latin American country to legalize marriage equality. Several local jurisdictions, including in the capital city of Buenos Aires, authorized same-sex civil unions prior to the national legislation. The bill narrowly passed the Senate, with 33 votes in favor, 27 against, and 3 abstentions (Equaldex 2016). This law affords same-sex couples access to the same legal protections as opposite-sex couples, such as adoption and pension benefits (HRW 2016). Between 2010 and 2016, approximately 12,500 same-sex couples were married across the country (HRW 2016).

8 Argentina

No laws criminalize same-sex conduct between consenting adults, and the lesbian, gay, bisexual, transgender, and intersex (LGBTI) community largely experiences the same legal rights and protections as the heterosexual population (U.S. Department of State 2015). Lesbians and gays may serve openly in the Argentinean military.

LGBTI discrimination, particularly in employment and housing, varies by region (Equaldex 2016). NGOs and the media have both reported cases of discrimination, violence, and police brutality toward the LGBTI community, especially transgender persons. The Trans Murder Monitoring Project reported 2,115 known cases of trans murders between January 2008 and April 2016, with 45 of those taking place in Argentina (TGEU 2016). None of these murders or acts of violence resulted in indictments during 2015 (U.S. Department of State 2015).

A positive for the transgender population in Argentina was the passing of a Gender Identity Law in 2012. Under this landmark law, those over age 18 are allowed to revise official documents to reflect their gender identity without any prior judicial or medical approval (HRW 2016). The law also provides access to gender confirmation surgery and hormone replacement therapy, both of which are covered under public and private health insurance.

Indigenous Communities

Representing 19 different groups, the indigenous population of Argentina is roughly 400,000 (SIGI 2016). Ethnic and cultural identities of indigenous peoples are recognized and protected by the constitution. Protections include the right to bilingual education, recognition of their communities and the communal ownership of ancestral lands, and participation in the management of their natural resources. Unlike in the United States, there is no formal process for recognizing indigenous tribes or determining who is an indigenous person; however, some indigenous communities choose to register with the local and federal government as civic associations (U.S. Department of State 2015). Indigenous peoples commonly encounter obstacles in accessing justice, land, education, health care, and basic services (HRW 2016). Indigenous women are particularly vulnerable to sexual violence and human rights abuse (SIGI 2016).

Politics

Women gained the right to vote in 1947. From the influential Eva Perón (first lady 1946–1952) to Cristina Fernández

de Kirchner (president 2007–2015), women have attained the highest levels of power. Eva “Evita” Perón played a large and visible role in orchestrating social welfare policies, and one of her passions was for education. Through her philanthropic foundation, she planned for the construction of 1,000 schools throughout Argentina, as well as agricultural schools, workshops, nursery schools, and day care centers. Eva used her position as first lady to fight for the causes she was passionate about, which included women’s suffrage and improving the lives of the poor. Cristina Fernández de Kirchner, a former first lady, was the first female to be elected president of Argentina in 2007. Isabel Martínez de Perón served as first lady and vice president during her husband, Juan Perón’s (October 9, 1895–July 1, 1974) third term, and when he died in office, she assumed the role of president.

Argentina operates as a presidential republic. Branches include the executive, the legal system, the national legislature, and regional legislatures (23 states and an autonomous federal district) (EIU 2015). The president, who heads the executive branch, can be elected for up to two consecutive four-year terms and also serves as commander of chief of the armed forces. The national legislature, also known as the Bicameral Congress, is composed of the 257-member lower house, the Chamber of Deputies, and the 72-member Senate, called the upper house (EIU 2015).

In an effort to increase women’s representation, a quota system was developed. An official decree issued in 2000 states that one-third of the members of both houses of Congress must be women. To achieve this goal, all electoral lists must be composed of at least 30 percent women, and as of 2013, 37.4 percent of the congressional seats were held by women (SIGI 2016). An additional decree was issued in 2003 in an effort to bring more gender diversity to the Supreme Court (SIGI 2016). Quotas also exist at the regional level, and depending on the province, women hold anywhere from 4 percent to 48 percent of the parliamentary seats (SIGI 2016). As of 2015, the country ranks 15th in female participation in national legislation.

The use of a quota system has helped to solidify Argentina among the region’s top performers. It is 22nd globally, on the Political Empowerment Index component of the Global Gender Gap Index (WEF 2016b). However, some would suggest it is important to consider that the presence of women does not equate to gender-equitable policy development. For example, President Cristina Fernández de Kirchner was both a proponent of marriage equality for lesbians and gays but also staunchly antiabortion, and the

current president, Mauricio Macri, selected noted feminist Fabiana Tuñez to head the National Office of Women's Affairs.

Religious and Cultural Roles

The Catholic Church has played a crucial role since the arrival of colonizers, particularly during the Spanish conquest. To this day, 92 percent of the population identifies as Catholic, though for most it is a cultural rather than a religious identity. Only about 20 percent of Catholics actively engage in the faith beyond the celebration of holy days. Many national public holidays are connected to Catholicism, including Good Friday, Immaculate Conception Day, and Christmas.

Until 1994, being Catholic was a requirement for becoming president or vice president. Even without this requirement, the Catholic Church has strong influences on and within the government. During her tenure as president, Cristina Fernández Kirchner was willing to go against church teachings to support marriage equality for gays and lesbians, but she was not willing to take a contradictory stance to the church on abortion. Indeed, Catholic antiabortion and anticontraception messages still carry political weight. Until as recently as 1999, an annual national Day of the Unborn Child was celebrated (HRW 2010). The current pope, Pope Francis, is Argentinean and the first from the Americas.

There is also a large Jewish population in the country of about 250,000 persons. Despite a long history in Argentina, sporadic acts of anti-Semitic discrimination and vandalism are not uncommon. The most reported anti-Semitic incidents were slurs posted online, graffiti, verbal slurs, and the desecration of Jewish cemeteries. During August 2015, in the town of Colonia, swastikas, pro-Nazi slogans, and terms such as "white power" were spray-painted on the walls lining a main thoroughfare (U.S. Department of State 2015).

Issues

Legacies of the "Dirty War"

Coinciding with the last military dictatorship, the "Dirty War" lasted from 1976 to 1983 and is one of the darkest times in Argentina's history. Congress voided amnesty laws in 2005 that had been passed in the 1980s, and several cases of human rights violations committed during the war were reopened. As of June 2015, 595 convictions

have resulted from 142 cases of crimes against humanity committed by the dictatorship (HRW 2016).

As of 2012, Argentine Mothers marked 35 years of marching for justice. During the Dirty War era, these mothers lost their children and family members who were in any way perceived as political dissidents. Official accounts estimate almost 20,000 people were "disappeared" by the military; however, human rights groups say it is closer to 30,000. Some of the disappeared were young pregnant mothers who gave birth while incarcerated by the military. These children were taken from their mothers and registered to military members as their own children. Many were removed from Argentina. Some newborns were left alone at various orphanages with an unknown name; they became known as children "NN." These mothers still seek justice; they demand an explanation for what happened to their children and seek to be reunited with their grandchildren. The Abuelas (grandmothers) de Plaza de Mayo, an NGO, march and chant every weekend in a downtown plaza in Buenos Aires, demanding this justice.

Efforts made by the government have helped to identify children who were taken illegally during the war. The National Bank of Genetic Data, created by the government in 1987, played a significant role in helping to reunite families until a 2009 law significantly limited its effectiveness (HRW 2016). On October 16, 2015, the Abuelas de Plaza de Mayo announced that, over the course of the previous year, 2 of the estimated 500 persons born to detained and missing dissidents during the dictatorship had been identified and made aware of their background (U.S. Department of State 2015).

Criminal Justice

Prison conditions and police abuse are two criminal justice issues causing alarm. Overcrowded and inadequate facilities combined with violence between inmates and at the hands of guards have contributed to a failing prison system. Inmates in many facilities suffer from poor nutrition, insufficient medical and psychological treatment, inadequate sanitation, limited family visits, and frequent degrading treatment (U.S. Department of State 2015). The 2016 CEDAW report raised concerns over invasive body searches performed in women's prisons and a lack of electronic surveillance systems in provincial-level facilities. Between January and September of 2015, 33 deaths, 17 of them violent, were reported to the Congressional National Penitentiary Office (HRW 2016). Nearly 800 cases of

torture or ill-treatment in federal prisons were reported during 2014. Four federal corrections officers were convicted in June 2015 for their role in torturing a detainee who had been charged to their care in 2011 (HRW 2016).

The U.S. Department of State's *Country Reports on Human Rights Practices for 2015* cites instances of arbitrary arrest, detainment, and unlawful killings by police. Harassment of the LGBTI community by police is relatively common. Police abuse has been identified as a significant problem. The following are two recent examples highlighted by Human Rights Watch (HRW 2016). During an August 2015 protest in the Tucumán province, police engaged with protesters by firing rubber bullets and beating protesters with batons. Dozens of protesters were injured. In 2016, a police officer was convicted of torturing teenager Luciano Arruga in 2008. Arbitrarily detained, Arruga's whereabouts were unknown until 2014, when his remains were found buried in a cemetery in Buenos Aires (HRW 2016).

Trafficking

A national program to combat human trafficking and exploitation exists, and current legislation on human trafficking covers all forms of trafficking designated in the UN Trafficking in Persons Protocol (UNODC 2016a). Argentina is a country of origin transit and a destination for trafficking, and most of the affected women are from the following: Brazil (1%), Bolivia (46%), the Dominican Republic (16%), Paraguay (27%), and Peru (5%) (CEDAW 2016; UNODC 2016b). These countries match with the observation that cross-border trafficking in many cases broadly resembles regular migration flows (UNODC 2016b). Forced labor and sexual exploitation are the top two forms of exploitation. Of the approximately 5,800 victims detected in South America whose gender and age were reported between 2012 and 2014, the majority were women (45%), followed by girls (29%), men (15%), and boys (11%)—in the Southern Cone countries of Argentina, Chile, and Uruguay, adult victims are most common (UNODC 2016b).

Indigenous Rights

Indigenous peoples have been made to feel like outsiders in their own country. They have been subjected to state violence, intimidation, and discrimination, and their human rights are often ignored. Under current law, the

indigenous population lacks the right to free, prior, and informed consent when the government makes decisions that may affect their rights (HRW 2016). When seeking justice, they often face additional challenges, including linguistic, cultural, and economic barriers.

Land access has been a key indigenous issue in recent years. Despite constitutional rights to the contrary, indigenous people do not fully participate in the management of their lands or natural resources, in part because implementing the law is delegated to the 24 provinces, only 11 of which have constitutions recognizing indigenous rights (U.S. Department of State 2015). Further, state and private interests, especially those of the agribusiness and extractive industries, have formed enormous barriers to the indigenous population and their rights to their traditional lands (Amnesty International 2013). A November 2010 protest against a national university seeking to build on indigenous lands came to a violent end when police shot into the crowd, resulting in two deaths (one protestor and one police officer), several injured, and homes burned (Amnesty International 2013). In February 2015, members of the Qom indigenous tribe, with representatives of the Pilaga, Wichi, and Nivacle indigenous communities, built a temporary protest camp on a principal avenue in Buenos Aires. The camp was raided by riot police in armored vehicles on July 5, as an attempt to evict the protestors; the raid failed (U.S. Department of State 2015).

In general, the indigenous peoples of Argentina experience lower levels of social and economic development and high rates of illiteracy, unemployment, and chronic disease. Indigenous women's and girls' access to education is further limited by housework expectations, caretaking obligations, their work in hotels or as sexual workers, and a priority being given to boys' education (CEDAW 2016). Upon assuming office on December 10, 2015, the current president, Mauricio Macri, met with indigenous leaders, where he promised open dialogue and reaffirmed the responsibility to treat indigenous issues as a matter of human rights (U.S. Department of State 2015). It is too soon to know what policy, practices, and laws President Macri may implement to follow through in his stated commitment to indigenous rights.

Beauty Standards and Body Image

Latin American women have been stereotyped as being "exotic," characterized by being tall with fair skin, fine facial features and perfect figures. Many women and girls

have come to hold themselves to this unattainable standard of beauty. In many Latin American countries, girls' focus on beauty starts as early as the age of seven with enrollment in a beauty academy. At these schools, girls are taught about fashion, etiquette, and other aspects of beauty.

The obsession with these standards of female beauty has contributed to some of the world's highest rates of eating disorders among women. By the time girls become teenagers, the desire to look perfect can result in seeking plastic surgery to help attain their goal of a flawless body. The use of plastic surgery is so common that it is almost a national hobby. This issue was exacerbated when Miss Argentina died from complications during plastic surgery. She was trying to reach the beauty ideal of firmer buttocks in 2014. After this tragic incident, the Argentine city of Chivilcoy elected to ban any further beauty pageants from its municipal festivals. The director of Miss Argentina has stated that completely banning pageants is going too far, and it should focus on eliminating the sole emphasis on beauty. In December 2014, standards for beauty pageants also focused on social responsibility. Contestants were required to state how they are aware of various social issues, such as sex trafficking, in their communities (Romero 2014).

The focus on, often unattainable, beauty standards is also seen in clothing. Most clothing designers and companies focus on only small sizes and exclude average-sized women (Mowat 2011). Most girls and teens worry about their looks and especially their weight. According to the feminist organization *Fundacion Mujeres en Igualdad* (Women in Equality Foundation), women in general have a very hard time finding Argentinian clothes that fit. Industry designers make clothes for girls and teens that are the equivalent of U.S. sizes 0–5, which makes clothes shopping frustrating and can feel impossible for many. *Fundacion's* director, Monique Thiteux, stated that 70 percent of women have to shop at specialty stores that carry larger sizes, such as the equivalent of a U.S. size 8. *Fundacion* and similar organizations work to battle the beauty myth because it sets unrealistic expectations and are a major cause of many eating disorders. According to ALUBA, Argentina's Association Against Bulimia and Anorexia, it is estimated that 95 percent of women and girls believe they are fat. This along with media representations and many other reasons make Argentina the country with the second-highest rate of eating disorders.

In an effort to require regular sizes in clothing stores, some provinces and municipalities implemented the

Ley de Talles, or size laws, mandating shops to carry sizes that would be equivalent to a U.S. 8–16 (Mowat 2011). The Buenos Aires branch of the global group Endangered Bodies, also called AnyBody Argentina, raises awareness about the epidemic of poor body confidence and challenges the norms that lead women to dislike their bodies. The group also focuses on other feminist issues, including the representation of women in society, and since 2010, it promotes compliance with the size laws. Other activism coordinated with Endangered Bodies include the #FatIsNotAFeeing campaign that worked to end Facebook's use of "fat" as a feeling in their list of "I'm feeling" options.

B

Bahamas, Barbados, and the Turks and Caicos Islands

Overview of Country

The Bahamas, Barbados, and the Turks and Caicos Islands are English-speaking Caribbean islands that possess similar historical, social, and political characteristics. The Commonwealth of the Bahamas is located in the Western Atlantic Ocean, 500 miles off the coast of Florida. An archipelago of 700 islands, cays, and rocks spans approximately 100,000 square miles. Twenty of the islands are inhabited. New Providence is the most heavily populated island and is home to the capital city of Nassau. The Bahamas is divided into 31 districts. Islanders are referred to as Bahamians.

Barbados is located in the Eastern Caribbean in the North Atlantic Ocean, 300 miles to the northeast of Venezuela. The island is 14 miles wide and 21 miles long. It has a total land area of 166 square miles and is divided into 11 parishes. The capital of Bridgetown is located in the parish of St. Michael. Islanders are referred to as Barbadians or, more colloquially, as Bajans.

The Turks and Caicos Islands has a total land area of 193 square miles and is an archipelago of approximately 40 islands. The six largest islands and two cays are inhabited. The other islands in this archipelago are uninhabited. The

islands are divided into two groups: the Caicos Islands and the Turks Islands. The Turks Islands comprise Grand Turk, the capital of the Turks and Caicos Islands, Salt Cay, and adjacent cays. The Caicos Islands is made up of Providenciales, South Caicos, East Caicos, Middle (or Grand) Caicos, North Caicos, West Caicos, Pine Cay, and Parrot Cay. Pine Cay and Parrot Cay are inhabited with private resorts (Mills 2009, 1). Nationals of the Caicos and Turks islands refer to themselves as Belongers. Migrants are referred to as non-Belongers.

These three countries all share a similar history in that they were all colonized by the British. The Bahamas was settled by the British in 1647 and became a British colony in 1783. It remained under British rule until it gained political independence in 1973 (CIA 2017). Barbados was settled by the British in 1625 and remained a British colony until it gained political independence in 1966. In the early 1700s, British Bermudians began traveling to the Turks and Caicos Islands so they could mine salt. The islands officially became a British settlement during this period. The Turks and Caicos Islands remain a British colony to this day. However, from 1973 to the present, the country has been a self-governing British Overseas Territories (CIA 2017).

As of July 2015, the population of the Bahamas stood at 324,597 (CIA 2017). As of 2010, the island had a gender ratio of 94 males per 100 females (Commonwealth of the Bahamas 2010, 8). New Providence, Grand Bahama, and

Abaco are the three most-populated islands and are home to 90 percent of the population (2). The majority of Bahamians, 267,000, live in the capital city of Nassau.

As of 2015, Barbados's population was 290,604 (CIA 2017); 52.1 percent are female and 47.9 percent are male (Allen and Maughan 2016, 32). Barbados has a high population density; in 2017, it was 664.4 persons per square kilometer and was the tenth most populous country in the world (Country Meters 2017).

The 2012 census places the population of the Turks and Caicos Islands at 31,500 (TCICPA 2014, vol. 1, 12). Forty-eight percent of the population is male, and 52 percent is female (16). Since the 1970s, its population has increased fivefold and nearly doubled in the 1990s when the tourist industry began to thrive and people from nearby countries migrated in search of work (TCICPA 2014, 2). Almost 75 percent of the population lives on Providenciales (Wiggins 2015, 35). At 40 percent, nationals of the Turks and Caicos Islands are in the minority. The remaining 60 percent are immigrants. Of these, 35 percent are Haitian, 8 percent are Jamaican, and 5 percent are Dominican Republican. The majority of the population, 61 percent, is of working age (24–64 years). One-third of the population is under 25 years of age, and 2.5 percent are elderly. Thirty-six percent of households have female heads (TCICPA 2014, 3–4).

Historically, the Bahamas, Barbados, and the Turks and Caicos Islands were plantation societies that rested on the labor of enslaved Africans, and their economies primarily relied on agriculture. From the time of British colonization, the Bahamas and Barbados cultivated sugarcane to ship sugar and its by-products to the “mother country.” In the Turks and Caicos Islands, the British harvested salt. In the latter decades of the 20th century, agriculture declined, and tourism became the economic mainstay. Hence, all three territories are heavily dependent on the tourism and financial services sectors, accounting for a significant portion of their gross domestic product (GDP).

The Bahamas is one of the most prosperous Caribbean territories. Tourism and its related construction and manufacturing account for roughly 60 percent of GDP, financial and business services account for approximately 35 percent of GDP, and manufacturing and agriculture contribute to less than 10 percent of GDP. Although the Bahamian economy declined in the years 2007–2011 in the face of the global recession, it is expected that growth will resume as new tourism-related construction projects are introduced and employment increases (CIA 2017).

As with the Bahamas, Barbados's economy rests primarily on the financial, business services, and tourism sectors. In 2012, the financial services sector accounted for 30.5 percent of GDP; hotels and restaurants accounted for 13.2 percent of GDP; the government sector contributed 13 percent to GDP; the transport, storage, and communications sector contributed 11.5 percent to GDP, and the wholesale and retail sector contributed 10 percent to GDP (Allen and Maughan 2016, 22). In the wake of the economic crisis of 2008, the Barbadian economy declined. Between 2009 and 2013, growth in GDP declined from approximately 4.1 percent to zero growth (19). However, as of 2016, the economy was showing signs of recovery; it was expected to grow by 2.1 percent in 2016 (IMF 2016).

Historically, the Turks and Caicos Islands' economy rested on salt production. After this industry declined in the 1960s and 1970s, the government turned to tourism, which is now the bedrock of the Turks and Caicos Islands' economy. Tourist accommodations were built, and the airline industry developed. The tourist industry developed in the 1980s and matured in the 1990s, which resulted in an economic revival (Clare 2009, 203–213).

The financial services sector, construction, and agriculture and fisheries are other major economic sectors of the Turks and Caicos Islands (Mills 2009, 222–228). A

wholesale and retail sector and the public sector are other major components of the economy. From 2000 to 2008, the economy grew by 9 percent. However, the economic downturn of 2008, the negative impact of Hurricane Ike, and a corruption scandal in government led to a 20 percent decline in GDP. The construction sector registered a 50 percent decline, and tourism declined by 30 percent. The financial and public sectors were largely unaffected. The worst of the economic difficulties are over, and the islands' economy is showing signs of recovery, as evinced by the tourism sector that rebounded and grew by 4 percent in 2011 (TCICPA 2014, 4).

Overview of Women

The Bahamas, Barbados, and the Turks and Caicos Islands have made significant progress in human development. However, progress in the area of gender equality has not kept pace with these advances. The Bahamas and Barbados have high levels of human development. The Human Development Index (HDI) measures the quality of life, the standard of living, and a population's access to education. Since 2000, the HDI for the Bahamas has trended upward and stood at 0.790 in 2017 (UNDP 2015). The country is ranked 55th out of 188 countries. The Gender Development Index (GDI), which measures inequality based on gender in the areas of health, education, and control of economic resources, has not been calculated for the Bahamas. However, it has a Gender Inequality Index (GII) of 0.298 and is ranked 58th out of 155 countries. The GII measures gender-based inequalities in the areas of reproductive health, political and educational empowerment, and economic activity (participation in the labor force).

Barbados's HDI is 0.785 and is ranked 57th out of 188 countries. The UN Development Programme (UNDP) places the GDI of the Bahamas at 1.018 and its GII at 0.357, ranking it 69th out of 155 countries (2015). The Turks and Caicos Islands are not listed on the HDI. However, islanders enjoy a high standard of living compared to other Caribbean territories. Only two other Caribbean countries have a higher average income per person. Its poverty declined from 26 percent in 1999 to 21.6 percent in 2012, and there are almost no cases of indigence (Wiggins 2015, 35).

Girls and Teens

Girls' identity generally revolves around the major institutions of socialization: parents, home and family life,

school, and church. Parents in middle- and upper-class families tend to be married, and these families more closely reflect the nuclear family structure of Western societies. In lower socioeconomic groups, common-law unions where parents live together but are not married, visiting relationships where a woman lives with her parents and is visited by a partner, and single-parent families are more common. The East Indian and Chinese communities often live in extended families that are male-headed and based on marriage (Innerarity 2000, 61).

Women often bear the responsibility of caring for children on a day-to-day basis. Fathers may contribute financially, but they are generally more emotionally distant than the mothers. In instances where the mother cannot be physically present to look after a child, children may be parented by other female relatives, such as grandmothers and aunts. Child shifting, where children move between homes, is not uncommon in cases where parents have separated or migrated. In such cases, children may move between the homes of the parents or their relatives based on logistics or economic expediency (Barrow-Giles 2005, 76–77). Home life for girls is negatively affected when parents experience difficulties such as financial instability, unemployment, health issues, or interpersonal problems or when one parent is absent and does not contribute to the household (79).

Girls are generally socialized to be conservative and to avoid risky behaviors, while boys are given more freedom. From about the age of five, girls are expected to do house chores and are generally kept closer to home. Their movements are more restricted and monitored than boys, who tend to do chores outside the home and who have greater freedom to engage in outdoor games and sporting activities. This freedom of movement provides boys with greater sexual freedom as they mature, whereas girls' sexuality is restricted and closely monitored (Blank 2013, 5). Female adolescent sexuality is often closely monitored with the aim of enhancing the life prospects of young females by preventing their early initiation into sexual activity and the negative consequences of early motherhood. The consensus is that if girls delay sexual activity, they can avoid early pregnancies and the educational, social, and financial complications that often accompany them.

Though well-intentioned, this approach to female sexuality is restrictive and sometimes makes it difficult for girls to appropriately express their sexuality and make safe decisions in sexual relationships. For example, in Barbados, girls are often placed into a binary of the "good girl" or the

"bad" or "bashy" girl. Good girls, or "church girls," are raised in the church, avoid risks, and generally abstain from and delay sexual activity until they are older and place a heavy premium on doing well in school. Bad or "bashment" girls place a high premium on their physical appearance and dress to impress in the latest fashions, often in revealing clothes, and project a no-nonsense, assertive, and self-possessed attitude (Barrow-Giles 2005, 72–73).

Parent-adolescent communication on sex and sexuality is often didactic and may discourage some girls from openly discussing relationships and sexual matters with their parents. This approach to communication about sexuality may be counterproductive in that some girls may be secretive and try to hide their sexual relationships from parents, which may lead to careless sexual activity among teen girls (81, 83). The high rate of teen pregnancy in these territories indicates that despite formal sex education in schools, adolescent girls' sexuality is still not adequately addressed. They may have difficulty accessing contraceptives, as they must receive parental permission before receiving contraception from health care providers.

Gender inequality and gender-based violence increase girls' risk for contracting HIV/AIDS and sexually transmitted infections and diseases. Girls may find it difficult to negotiate safe-sex practices if their partner holds the power in the relationship. This may be especially true in intergenerational relationships, where a male partner could be 10 or more years older, or in transactional relationships where sex is exchanged for material gifts.

Health and family education is provided in schools in the Bahamas, Barbados, and the Turks and Caicos Islands. This curriculum seeks to provide students with important life skills in areas such as nutrition and physical activity, sexuality, sexually transmitted diseases, teenage pregnancy, violence, and substance abuse (UNICEF/CAO 2002). However, evidence suggests that this program may not be as effective as it should be, as some girls do feel that this curriculum does not meet their needs as adolescents. While up to 65 percent of students attend these classes, some girls reported they were not provided with adequate information about HIV/AIDS. Other girls felt that facilitators and counselors focused too much on HIV/AIDS and did not leave room to discuss other significant issues. Some girls expressed that counselors were reluctant to meaningfully discuss important issues (Barrow-Giles 2005, 26, 85–86).

Traditionally, in these societies, Western beauty ideals tended to privilege women with light skin and long,

Deaf Girls and Women Worldwide

Take whatever you know about the status of girls worldwide. Where there is lack, in education, in equality with males, in access to basic needs, multiply that many times over for girls who are born or who become deaf. The vast majority of these deaf girls will be in families with no other deaf members. In some instances, the girls will simply be considered uneducable and of very low value. In other places, education for the deaf may be many miles away, an impossible distance. Or, the cost for education may be prohibitive. Even at home, where family members could take on the challenge to learn the native sign language, family members may only learn (or invent) a smattering of signs, leaving the deaf girl isolated and limiting her ability to express herself with others. For her whole life, she will be surrounded by hearing people who pity her and patronize her, assuming it is far better to be hearing than to be deaf.

For the deaf child who is able to attend school, sign language may be discouraged or not allowed, with school officials attempting to mold the child into a semblance of a hearing person, emphasizing speechreading (lipreading) and vocalization at the expense of other subjects. Even with an education, deaf girls and women find themselves unable to access higher education where sign language interpreters are not provided. Even with a good education, deaf girls and women are routinely passed over for employment. Employers routinely assume that a deaf person cannot do the job, whatever the job is, without investigating how they might be able to do the job with some accommodations.

—Adele Harth

straight hair. This beauty ideal was associated with social mobility and prestige; norms derived from plantation history, where the white race was held in prestige because of their economic and social privileges. Today, Western beauty standards are still highly valued, due in part to the influence of North American media. The continued popularity of such standards is evinced with money that females spend to procure synthetic weaves and human hair, eyebrows, eyelashes, and wigs that approximate the

European ideal of beauty. In Barbados, for example, these products account for a significant portion of imports to the island. Recently, a greater premium is being placed on natural beauty, with girls and women wearing a range of natural hairstyles that include locks, twists, and braids (Smith 2015). More women are expressing greater satisfaction with their body size and image (Sands 2014).

Girls have increased access to education, and many aspire to combine careers and work with a family life that includes motherhood and marriage. Education has been traditionally stressed as a means to achieve financial independence and improve their quality of life. In the early decades of the 20th century, when access to education was limited, boys were favored to be educated, as it was thought that girls would marry and their husbands would provide for them. This attitude has changed, and now girls tend to outperform boys academically.

Education

In these territories, females tend to perform better academically than males at all levels of education. As of 1997, the literacy rate in the Bahamas was 95.8 percent (UNDP 2015). As of 2012, Barbados's literacy rate for both males and females was 99.7 percent (Allen and Maughan 2016, 14). Primary and secondary is universal and required until the age of 15; in the Turks and Caicos Islands, it is required until the age of 16. An area of difference, however, is technical and vocational education, which more males than females pursue, giving them more technical and vocational qualifications than women.

In the Bahamas, women on average attend school for 11.1 years, whereas men average 10.7 years. Women also generally tend to have more secondary education than men. In the 25 and older age range, 91.2 percent of women have at least some secondary education, compared to 87.6 percent of men. Women also outnumber men at the tertiary level of education (Commonwealth of the Bahamas 2010, 12–13). The two major tertiary education institutions that are publicly funded are the University of the Bahamas and the Bahamas Technical and Vocational Institute, which provide academic and technical and vocational training, respectively. Three other government-funded tertiary institutions are the Police College, which trains police recruits and officers; the Public Service Training Centre, which trains civil servants and government personnel of all levels; and the Bahama Host Program, which trains workers in the tourism industry. A variety of other private

institutions, some of which are satellite campuses of North American colleges and universities, also exist. According to the Bahamas census of 2010, Women account for 61 percent of students at the college level. Women also tend to possess more degrees than men. Sixty percent of women have degrees, except at the doctoral level, and 54 percent of men have degrees (12–13).

In Barbados, The UNDP *Human Development Report of 2015* places the mean years of schooling for females at 10.6 years and the mean years of schooling for males at 10.2 years (UNDP 2015). Those with at least some secondary education include females (aged 25 and older) at 89.5 percent. For males aged 25 and older, it is slightly lower at 87.7 percent.

In the Barbados Common Entrance Exam, which students take in the final year of elementary school, girls on average receive higher marks than their male counterparts. In the Caribbean Secondary Education Certificate (CSEC) Exam that students take at the end of their fifth year in high school, the grade distribution is more, even though girls tend to obtain more distinctions (Grade I passes) than boys, who tend to fail more often. In addition, more girls, 58.9 percent, than boys take these exams. Girls also outperform boys at the Caribbean Advanced Proficiency Examinations (CAPE) level, which is taken in the sixth form of secondary schools. In 2012, 58.5 percent of girls took the Cape Exam, compared to 41.5 percent of boys. They also tend to receive higher grades in this exam than boys. This trend continues at the tertiary level, where females outnumber males (Allen and Maughan 2016, 42–46). As of 2016, 67.1 percent of students enrolled at the University of the West Indies (UWI) were female, and 32.9 percent were male. At the undergraduate level, 66 percent of all students are female, and 33 percent are male. At the graduate level, 26.5 percent of all students were male, and 73.5 percent were female (CIA 2017).

Men are the majority in science and technology fields and technical and vocational education. At the UWI, females outnumber males in all areas of study except science and technology. Males also predominate at the Samuel Jackman Prescod Polytechnic, a tertiary institution specializing in technical and vocational skills, and outnumber females in the technical and vocational subjects offered at the CSEC level (Allen and Maughan 2016, 46–47).

In the Turks and Caicos Islands, more women than men have postsecondary qualifications. This disparity is extremely pronounced for those aged 25–44 years. For this group, twice as many women as men have postsecondary

qualifications (TCICPA 39). The Belonger population is more educated than the non-Belonger population. Twenty-two percent of non-Belongers have received no secondary education and possess no educational certification, compared to less than 10 percent of Belongers having no secondary education. Twelve percent of non-Belongers have degrees, compared with 24 percent of Belongers (38). Children of Haitian immigrants seem to experience some discrimination in the educational system. Some have difficulty finding places in a crowded educational system that caters to the Belongers' population first, and some experience discrimination in schools (91). The Turks and Caicos Islands Community Campus, which has campuses on Providenciales and Grand Turk, is the only public tertiary-level education institution in the country.

Health

Although women have made significant educational advances in terms of their levels of certification, these gains have not resulted in similar advances in their health and survival. Life expectancy in all the Turks and Caicos, the Bahamas, and Barbados is high and comparable to that of other western countries. However, the longevity of the general populace is undermined by the reduced quality of life that the elderly experience in their later years because their health expectancy is lower than their life expectancy. Women tend to live longer than males and enjoy a slightly better life expectancy. However, maternal mortality rates are high when compared to other western countries. Women's access to health care is potentially jeopardized by an increased burden placed on these islands' health care systems due to the 2008 economic recession.

The average life expectancy at birth of Bahamians is 75.4 years (UNDP 2015). The life expectancy at birth for Bahamian females is 78.3 years compared to 72.3 years for men. However, as of 2012, the health expectancy for both sexes was 11 years lower than life expectancy (WHO 2016). In their last 11 years of life, both males and females experience reduced quality of life due to illness and disability. The adult mortality rate for women is also lower than that of men. The UNDP *Human Development Report of 2015* places the adult mortality rate among women at 88 per 1,000 people, compared to 141 per 1,000 people for men. The infant mortality rate is 10.4 per 1,000 live births (UNICEF 2003).

In Barbados, women's life expectancy is also higher than that of men, and their adult mortality rate is lower than

that of men. The overall average life expectancy at birth is 75.6; for females it is 78 years, and for males it is 73.2 years. As of 2012, health expectancy for both sexes was 12 years lower than life expectancy. The adult mortality rate among women is 65 per 1,000 people, compared to 116 per 1,000 people for men (UNDP 2015). The infant mortality rate per 1,000 live births is 13.3, and the maternal mortality ratio is 52 deaths per 100,000 live births (UNICEF 2013).

In the Turks and Caicos Islands, life expectancy is also high—82 years for women and 76.5 years for men. At approximately 6 per 1,000, infant mortality rates are low in comparison to most Latin American and Caribbean countries (TCICPA 2014, 19, 25).

Access to Health Care

Approximately 70 percent of Bahamians lack health insurance and pay for their health services on their own, which they may not be able to afford. The average Bahamian household spends roughly \$2,300 per year out of pocket on health care. The government has embarked on a plan, referred to as the National Health Initiative Bahamas (NHIB), to modernize health care facilities and make health care universal, more affordable, and easier to access by the average Bahamian. The plan is initially designed to provide primary health care services centered on promoting healthy behaviors and providing preventative care and medical services to maintain and promote health. It also aims to upgrade the existing health infrastructure of public and specialist clinics and hospitals and train or retrain health personnel to better meet the needs of their patients, including building a new maternal-child clinic in New Providence. Some initiatives target women and children by counselling for mothers “who are breastfeeding, monitoring and promoting nutrition, education and hygiene amongst children and young adults, support programs for pregnant women, children and the elderly and violence prevention programs” (NHIB 2016).

Health care in Barbados is funded by the government. Primary health care is free to all citizens and is provided through a system of eight polyclinics and clinics that are strategically located across the island. Acute, secondary, and tertiary health care is provided at the Queen Elizabeth Hospital, the island’s primary health care facility. There is one psychiatric hospital that caters to the mentally ill, one geriatric hospital, and four district hospitals providing care to the elderly. There are also two small private hospitals and three medical centers that provide emergency care and operate on a 24-hour basis (CALC 2012, vol. 2, 43).

Health care is free to all residents in the Turks and Caicos Islands and includes overseas treatment for health services that are not available on the islands. The government introduced a National Health Insurance Program (NHIP) in 2012, which is funded by the government, employers, and employees. The NHIP aims to make access to health care more equitable for all citizens of the islands. New hospitals with upgraded facilities and services have been built on Grand Turk and Providenciales. The other islands have primary care clinics. A challenge to the health care system is the high turnover of health care professionals, many of whom are contracted to work for a period of two to three years and often leave at the end of their contract period (TCICPA 2014, 632–634).

Haitian immigrants are often discriminated against in the health care system. Many only access the system in emergencies; poor and low-income Haitians are especially vulnerable. Pregnant women may not have any prenatal care and may only go to a hospital to give birth. Many Haitians are reluctant to use the TCI health care system to seek treatment for sexually transmitted infections (STIs) (89–90).

Maternal Health

In the Bahamas, the maternal mortality ratio is 37 deaths per 100,000 live births. A skilled health care professional attends to 98 percent of women at least once during pregnancy, and a skilled health care professional attends to almost all women, 99 percent, when giving birth (UNICEF 2003).

In Barbados, the maternal mortality ratio is 51 deaths per 1,000 live births, which compares unfavorably to countries with a high HDI where the average maternal mortality ratio is 15 (Allen and Maughan 2016, 18). Between 2008 and 2012, a skilled health care professional attended to all women at least once during their pregnancy and when giving birth (UNICEF 2013). Women receive free antenatal and postnatal care at the government-funded polyclinics. Maternal and child health services comprise a substantial portion of the health care delivered by the polyclinics, which also offer family planning and nutritional counseling. All antenatal cases are referred to the Queen Elizabeth Hospital between the 30th and 36th weeks of pregnancy, where women receive care until delivery (CALC 2012, vol. 2, 47).

In the Turks and Caicos Islands, an increase in immigration to the islands has meant increased demands on

the islands' health care services, especially in the areas of maternal and reproductive health and child health (TCICPA 2014, 635). Antenatal care is provided up to 35 weeks after birth (633).

The primary health care system, mainly clinics that treat minor ailments, has declined due to fiscal constraints, negatively affecting women's ability to access reproductive and sexual health services (TCICPA 2014, 19, 25).

Diseases and Disorders

The incidence of communicable diseases such as HIV/AIDS has fallen in all three territories, but the rise in chronic, noncommunicable diseases (CNCs), otherwise known as lifestyle diseases, threaten to negate any benefits gained from the decline in infectious diseases. CNCs are the most common cause of death on all three islands. Many of these diseases are linked to obesity and being overweight.

In the Bahamas, deaths due to HIV/AIDS have declined tremendously from 17 percent of all deaths in 1999 to 5 percent in 2010 (Department of Statistics 2016). The suicide rate for women is 1.3 per 100,000 people, which is slightly lower than their male counterparts at 3.6 per 100,000 people (UNDP 2015).

Infectious diseases that result from the increased movement of people and climate change, such as dengue fever, gastroenteritis and leptospirosis, are present in Barbados (CALC 2012, vol. 2, 51). In recent years, the mosquito-borne diseases chikungunya and Zika have also appeared. Cases of tuberculosis (TB) are present but remain low. Any rise in TB over the years has been linked to HIV/AIDS, as persons with compromised immune systems tend to become susceptible to TB. The Ministry of Health provides antiretroviral therapy (ART) to all residents infected with HIV, allowing them to live longer with the disease. Pregnant women are given the antiretroviral drug AZT free of cost, and there is a 95 percent success rate. Only 5 percent of the children born to these women remain HIV-positive to the age of 18 months. Barbados is dealing with an increase in noncommunicable diseases (NCDs), such as heart disease, type-2 diabetes, hypertension, and cancers that are primarily of the cervix, breast, and prostate (CALC 2012, vol. 2, 47–52).

In the Turks and Caicos, the incidence of preventable communicable diseases such as rubella, measles, and diphtheria is low due to an efficient vaccination service. TB cases are also rare, and most incidents that occur are

reported. However, HIV/AIDS cases are high, and as with the Bahamas and Barbados, there is a growing problem with NCDs (TCI CPA ES, 19). Chronic noncommunicable diseases, such as hypertension, heart disease, and diabetes, together with HIV/AIDS cause approximately one-third of all deaths. In 2005, antiretroviral therapy (ART) was introduced to treat HIV/AIDS, and by 2010, it was being administered to approximately 25 percent of those with the disease (TCICPA 2014, 631). In 2010, ART was administered to 23.4 percent of those known to be living with HIV (PAHO/WHO 2012, 205).

Hypertension and diabetes are the most common NCDs. In 2010, the hypertension rate was 32.2 per 10,000 people, and the diabetes rate was 11 per 10,000 people. In both instances, the male-to-female ratio is 1:1.4 (TCICPA 2014, 631–632). This increase in NCDs is due in large part to the increase in obesity among the population. Thirty percent of adolescents are either overweight or obese or at risk for being overweight (37).

Employment

Despite women's educational attainment, there is a gendered division of labor in all four territories. Women dominate in the service sector, while men tend to dominate in the manual and agricultural sectors.

In the Bahamas, a gender pay gap exists that places women at a disadvantage to men. The estimated gross national income per capita for females is 17,868.40 (as calculated in international dollars using a purchasing power parity rate). This is lower than the estimated gross national income per capita for males, which is 24,956.60 (2011 purchasing power parity rate). In addition, fewer women than men participate in the labor force; 69.3 percent of females who are 15 years and older participate in the labor force in comparison to 79.3 percent of men. The overall labor force participation rate for individuals who are 15 years and older is 74.1 percent. Women are concentrated into some work, such as domestic labor—6.4 percent of women work as domestics compared to 3 percent of men. The total unemployment rate is 16.2 percent, but the unemployment rate for youth aged 15–24 is almost twice as high at 30.8 percent (UNDP 2015).

In Barbados, female participation in the labor force is also lower compared to males: 62.1 percent of women compared to 73.1 percent of men as of 2013. The employment rate for males is 87.8 percent, and for females, it is 88.9 percent. At 11.1 percent, the unemployment rate for

females is slightly less than their male counterparts, which stands at 12.2 percent. On average, males earn 18.9 percent more than their female counterparts (Allen and Maughan 2016, 16). However, these figures are based on the formal economy and do not take into account women's work in the informal sector. Some women, particularly those who are poor, may earn income in the informal sector because such work allows them to balance caregiving responsibilities and work (28, 37).

The service economy dominates, with 72.6 percent employed in this industry (UNDP 2015). Employers are predominantly men, and self-employment is also dominated by men, a fact that contrasts with most of the developing world, where females tend to dominate in the self-employment sector (Bellony et al. 10). The percentage of men who own or manage businesses is 5.4 percent, compared to 2.5 percent for females (Allen and Maughan 2016, 17).

Women outnumber men in the wholesale and retail sectors (9.0% men; 11.2% women); the accommodation and food services sector, a division of the tourism industry (4.4% men; 8.3% women); education (2.4% men; 4.5% women); health and social work (1.5% men; 5.1% women); and domestic work (1.3% men; 3.7% women) (CIA 2017). Men dominate in construction, mining, and quarrying (11.1% men; 1.1% female); transportation and storage (5.7% men; 1.7% female); public administration and defense (5.4% men; 4.3% women); administrative and support services (4.4% men; 2.5% women); and electricity, gas, water, and agriculture (4.1% men; 2.3% women) (Allen and Maughan 2016, 22). More women than men work in the public sector, with men accounting for 44.6 percent (7,050) of all government workers and females accounting for 55.4 percent (8,741) of all government workers. Males, however, dominate in the police force, accounting for 78.3 percent of the 1,504 staff members (24).

After 2001, the Turks and Caicos Islands' labor force increased by 60 percent. As of 2012, women's labor force participation rate was 77 percent, compared to 86 percent for men. At 50 percent, total employment is divided evenly between men and women. The majority of the working population is between 25 and 44 years old, and approximately 70 percent of the unemployed are in this age group and have dependents that may include partners or children, signifying negative implications for families. The unemployment rate for women is 16 percent, compared to 18 percent for men (TCICPA 2014, 31–32). Nonnationals comprise two-thirds of the total employed population,

but they also account for more than 75 percent of the unemployed population. Many of these nonnationals may become illegal residents, as they lack the funds to renew work permits. The private sector accounts for 70 percent of all employment, and most of their employees are migrants. TCI nationals concentrate in the public sector, accounting for 18 percent of employment. Self-employment is 10 percent of all total employment, with 60 percent of TCI nationals being self-employed (32). Females are the majority in all sectors of the economy, except those requiring manual labor, such as construction, transportation, manufacturing, and agriculture (34, 36).

Family Life

The average household size is 3.4 persons; 61 percent of these homes are headed by men and 39 percent by women. The average household head is 45 years old (Commonwealth of the Bahamas 2010, 18–20). From the mid-1970s to the present, more than 50 percent of all births in the country were to unwed mothers (Department of Statistics 2016). In Barbados, of the 79,300 women in the 15–64 age group, 23.2 percent live with a husband; 9.1 percent are with a common-law partner (CLP); 15.4 percent are no longer with a husband or CLP; 31.6 percent never had a husband or CLP; and 1.2 percent are in a visiting relationship (Commonwealth of the Bahamas 2010, 181–183). Women are 33.6 percent of the heads of household, and 24.5 percent are the spouse or partner of the household head (200). Female-headed households have a higher poverty rate: 19.4 percent compared to 11.5 percent in male-headed households and 15 percent in all other households. Women head 62.2 percent of poor households. Female-headed households on average comprise more members than male-headed households. More women than men head households with more than four members, and these households have more dependents than other households. At 67.4 percent, a majority of women live without a resident partner, but they tend to live with their children and other family members (Allen and Maughan 2016, 30–31).

Generally, households in the Turks and Caicos Islands are differentiated based on whether they are composed of TCI nationals or are made up of nonnationals. Nonnationals account for 63 percent of households; nationals account for 27 percent of households; and 10 percent of households are a mixture of national and nonnationals. Women head 48 percent of the TCI national households, 34 percent of the nonnational households, and 25 percent

of mixed households. Overall, women head 36 percent of all households (TCICPA 21). Forty percent of households have children. In just under 50 percent of households, couples are living together. One-third of households with children have only one parent (20–21).

Homosexuality was decriminalized in 1991 in the Bahamas and in 2000 in the Turks and Caicos Islands, but it remains a criminal offense in Barbados under the Sexual Offences Act (1992). However, the law is not enforced, and consensual acts are not prosecuted. Same-sex unions are illegal in all three territories. The LGBT community on these islands is still vulnerable to discrimination. Gender-equality legislation has often been tied to gender-based legislation. For example, in 2016, in the Bahamas, a series of constitutional amendments were passed that extend citizenship rights to the foreign-born children and spouses of Bahamian women and make it unconstitutional to discriminate against others on the basis of their sex (Caribbean 360 2016). In Barbados, one leader in the struggle for gay rights is Donnya Piggott, the founder and leader of the gay rights advocacy group the Barbados Gays and Lesbians and All-Sexuals against Discrimination (B-GLAD). An activist, Piggott, brings awareness to the plight of the LGBT community in Barbados and the Caribbean and advocates for their rights (Williams 2015).

Politics

Although women comprise at least half the population in these three countries, their political participation falls below their male counterparts. They are underrepresented in both electoral politics and the hierarchy of individual political parties despite the removal of structural and systemic barriers to their participation in the political process. Underrepresentation is pronounced in the Bahamas and Barbados, but it is less severe in the Turks and Caicos Islands, where women's political participation is approaching levels that are comparable to that of men.

The Bahamas and Barbados are sovereign countries that retain only symbolic political ties with Great Britain. Each is a parliamentary democracy with a bicameral legislature and a multiparty system of government. Their constitutions are modeled after the British Westminster model, and both are members of the Commonwealth of Nations, which recognize Queen Elizabeth II as the head of state. Both territories have a governor-general who functions as the Queen's local representative, a ceremonial position that lacks any substantive political power. In both countries, the

legislature consists of a Senate and a House of Assembly, and the executive branch of government includes a cabinet of ministers that is headed by the prime minister. The judiciary of the Bahamas is made up of a Supreme Court and a Court of Appeal (Government of the Bahamas 2016). In Barbados, the judiciary includes a Magistrate of Courts, a High Court and a Court of Appeal (CALC 2012, vol. 2, 64). Both countries have two main political parties.

The Turks and Caicos Islands has not attained political sovereignty. Rather, it is a British Overseas Territory, and its government is made up of the following: a governor who is appointed as the Queen's representative; a deputy governor who is appointed by the governor; and a House of Assembly made up of 19 seats, of which 15 are directly elected by the people, 1 who is nominated by the premier and appointed by the governor, 1 who is nominated by the leader of the opposition and appointed by the governor, and 2 who are directly appointed by the governor (Government of the TCIs 2016). There are two main political parties in the Turks and Caicos Islands.

In the Bahamas, women hold 16.7 percent of the seats in parliament (CIA 2017). Of the 20 cabinet positions, 4 are held by women (Government of the Bahamas 2016). The share of seats held by women in parliament in Barbados is 19.6 percent (UNDP 2015). Of the 20 elected ministers in the House of Assembly, 17 are men and 3 are women (Allen and Maughan 2016, 16). One of these women is the leader of the current opposition party, the Barbados Labor Party. In the Turks and Caicos Islands, 46 percent of elected and nominated political positions are held by women (National Review TCI 2014, 7), and 7 of the 18 members of the House of Assembly are women (Government of the TCIs 2016). They include the deputy premier, three ministers, and the leader of the opposition (National Review TCI 2014, 7).

Regardless of their socioeconomic backgrounds, women are socialized to be caregivers and mothers and to see these roles as exclusive from political participation. Many women combine caregiving responsibilities with income-earning activity in the form of jobs and careers, leaving no time to devote to active involvement in the political process. Political parties have not provided incentives to attract or accommodate women so they can be successful. To date, women have not developed as a political block with the power to influence the outcomes of elections. They are not viewed as a demographic that has to be wooed by political parties (Barrow-Giles 2005, 56–58). Finally, women lack the same level of access to political

funds as their male counterparts. Historically, many politicians have risen from a business class possessing independent sources of wealth. Women, who have traditionally been excluded from this class, face the difficult task of generating their own funds or may have to depend on financial support from their parties to fund their campaigns (70).

Religious Roles

Women have traditionally made up the majority of church members in most churches and, as members of church-related groups such as the Mothers' Union, engage in charitable works to help the community. Yet, until recently, they have been barred from assuming positions of authority in the church. The Anglican Church has amended its practices to include women in leadership and administrative positions. Since 1996, the Anglican Church in Barbados has ordained women as priests (Alleyne 2016). To date, there are approximately 11 female priests and 1 female deacon. Women are also members of the Synod Council, the governing body that manages the church. In 1999, the Anglican Church of the Bahamas ordained its first female deacon, and in 2012, the Anglican Diocese in the Bahamas and the Turks and Caicos Islands voted to ordain women as bishops (*Nassau Guardian* 2012). Women also appear to be assuming more leadership positions in other religious denominations.

Issues

Teen Pregnancy

The teen pregnancy rates in the Caribbean territories are high. The UNDP *Human Development Report of 2015* places the adolescent birth rate in the Bahamas (births per 1,000 women ages 15–19) at 28.5. Ten percent of total births in the Bahamas are by females under the age of 20 (Department of Statistics 2016). According to Sonia Brown, president of PACE Foundation, each year in the Bahamas, an average of 700 girls under the age of 20 become pregnant. About 20 percent of these girls have a repeat pregnancy while still in their teens. In the 10 years prior to 2012, the teen pregnancy rate dropped by only 2 percent. Many of these young mothers, whose average age is 14–15, lack the maturity and other resources to adequately cope with their pregnancies and are often in need of caregivers and babysitters when they become employed (Cartwright-Carroll 2012).

In Barbados, the UNDP *Human Development Report of 2015* places the adolescent birth rate (births per 1,000

women ages 15–19) at 48.4. Among countries with a high HDI, the adolescent fertility rate is 18.7 percent (Allen and Maughan 2016, 18). In 2010, 14.9 percent of all births were to teen mothers (PAHO 2012). Although this is a substantial decline from the 1980s, where the teen pregnancy rates averaged 30 percent, high rates of teen abortions parallel the teen pregnancy rate decrease. The high rate of teen abortions indicates adolescent girls in Barbados may not have adequate access to contraception. Teen girls can only be provided with medical sexual and reproductive services, including contraceptives, if parental consent is given. Many doctors may adopt the view that the age of legal maturity is 18 and refuse to provide sexual and reproductive services to younger girls unless parental consent is given (Henry 2011, 2). Many teen girls are usually reluctant to reveal their sexual activity to their parents and thus may engage in risky sexual behaviors rather than elicit their parents' help to access contraception.

Contraceptive prevalence rates (CPR) have increased in the Latin American and Caribbean region from 61.2 percent in the 1990s to 72.7 percent in 2015 in women aged 15–49, and the unmet need for family planning (UNR) in this age group has declined from 17.3 percent in 1990 to 10.7 percent in 2015 (UNFPA 2016, 12, 16). However, the high rate of teen pregnancies in these three territories may indicate that CPR rates have not been fully satisfied among the adolescent demographic whose need for family planning remains unmet.

The teen pregnancy rate in the Turks and Caicos Islands, as of 2010, was 6.1 percent (PAHO 2012). Most teen pregnancies are unplanned and are usually accompanied by negative effects. Teen mothers are unable to complete school, they experience difficulties finding employment or their ability to attend work may be compromised because they cannot find a babysitter, they often receive no support from the fathers of the babies, and they have difficulty managing their maternal responsibilities with their desire to carry on with their former lifestyles (TCICPA 2014, 14). In addition, according to Inspector Irene Butterfield, the head of the Sexual Offences and Domestic Violence Unit within the Royal Turks and Caicos Islands Police Force, some cases of teen pregnancy are not being reported (*Turks and Caicos Weekly News* 2015).

A number of programs have been established to support teen mothers, such as PACE (Providing Access to Continued Education). In the Bahamas, the Ministry of Health provides counseling services to at-risk adolescents and PACE enrolls about 100–150 pregnant teens each year

in its educational and support services. It also seeks to make individuals aware of policies designed to reduce the teen pregnancy rate (Moss-Knight and Carroll 2013).

In Barbados, a health program that specifically targets adolescents was implemented in 2010. Based in schools and clinics, the program aims to educate teens and provide them with life skills on issues related to sexuality, violence, and substance abuse (PAHO 2012). The Barbados Family Planning Association (BFPA), established in 1953, also provides services to teen mothers in the form of counseling services that are designed to help adolescents assume control of their sexual and reproductive health. The BFPA also offers other services, such as Pap smears, pregnancy tests, contraceptives, and sterilization (CALC 2012, vol. 2, 47).

In the Turks and Caicos Islands, the Women in Development Program, a governmental agency administered by the Gender Affairs Unit (GAU), supports single mothers by raising public awareness of family issues and day care services and a Continuous Education Program (CEP). Established in 2000, CEP equips those unable to complete their education with basic skills to help them become more competitive in the job market (TCICPA 2014, 14).

Violence against Women and Human Trafficking

Gender-based violence has long plagued women in these societies and contributes to a significant portion of the crimes committed. Legislation has been put in place to address this issue, but it is not always adequate. In addition, crisis centers have been established to offer support and protection to women who are the victims of intimate partner violence. In the Bahamas, the Domestic Violence (Protection Orders) Act 2007 and the Sexual Offences and Domestic Violence Act Chap 99 (2006 Revised) provide legal recourse to victims of domestic violence and sex trafficking, and the Bahamas Crisis Centre, a nonprofit organization, provides assistance to victims of domestic abuse and advocates on their behalf.

In Barbados, legislation to address violence against women in the home and the workplace is in the process of being extended and implemented. In 1992, the island implemented the Domestic Violence (Protection Orders) Act, providing legal recourse. This act does not apply to visiting relationships, which are fairly common on the island. Attempts are also being made to implement and extend legislation on domestic violence, sexual harassment in the workplace, and human trafficking to offer better legal

recourse and protection to victims of these crimes. Women who are abused can receive help from the Services Alliance for Violent Encounters Foundation, popularly known as the SAVE Foundation, a nonprofit organization designed to provide counseling and other forms of support to women who have been abused by their partners (Canada: Immigration and Refugee Board of Canada 2017).

In the Turks and Caicos Islands, the most common crimes against women are domestic violence and sexual-related offenses. In 2011, the police established a Sexual Offences and Domestic Violence Unit to handle crimes against women and children and to encourage victims to report these crimes. Personnel have been trained to work with the victims of these crimes and the Social Services and Gender Affairs Department, which advocated that the unit be formed, to provide support and guidance to the victims (*Turks and Caicos Weekly News* 2015). The Social Services and Gender Affairs Department raises awareness about issues related to women at the local and community levels, advocates for women's rights, and promotes gender-equality legislation. Legislation designed to address the issue of domestic violence has been drafted but has not yet been implemented (Beijing Platform +20 Report 2014, 6). The island also has a high rate of human and sex trafficking. The large migrant population of the island is particularly vulnerable to sex trafficking and forced labor. Legislation against human trafficking has been drafted but has not yet been implemented (*Caribbean News Now* 2015).

Belize

Overview of Country

Belize, previously British Honduras until 1973, is located on the eastern coast of Central America on the Caribbean Sea between Guatemala and Mexico. Its shallow coastal waters are protected by a 185-mile barrier reef dotted by islets called *cayes*. The area of the mainland and cayes is 8,805 square miles (22,806 sq. km) (CIA 2016). The Maya Mountains and the Cockscomb Range dominate the southern half of the country with the highest elevation in Belize at 3,688 feet above sea level. The Cayo District in the west includes the Mountain Pine Range. The northern districts contain considerable areas of tableland. Eighteen major rivers drain low-lying areas, the largest being the Belize River (Merrill 1992).

Belize's subtropical climate is tempered by trade winds. Temperatures in the coastal districts range from 50 to 96 degrees Fahrenheit, with greater ranges inland. Average yearly rainfall ranges from 51 inches per year in the north to 175 inches in the extreme south (EOB 2016a). The Maya Golden Landscape forms one of Central America's last unbroken stretches of broadleaf forest and is a key link in the Mesoamerican Biological Corridor, one of the world's richest assemblages of biodiversity where some 18 species can be found nowhere else on earth. The forests preserve water quality that drains onto the Mesoamerican Barrier Reef and provide water for local communities and large agricultural areas (Fauna & Flora International 2014).

Belize's total population is approximately 353,000. Mayans, at 11 percent of the population, are the indigenous

people of Belize and among the poorest. They mainly live in the Toledo District, the least developed and southernmost district. Mestizos, the largest population at nearly 50 percent, arrived in Belize after fleeing the Yucatan in 1848. They mainly reside in the more developed Northern Districts. An influx of immigrants from Central American countries such as Guatemala, El Salvador, and Honduras can also be considered mestizo; they have been settling in rural areas and are creating new communities. Creoles, or Afro-Belizeans, comprise 25.9 percent of the population and are descendants of enslaved Africans; they primarily live in Belize City, Belize's largest city. Once slavery was abolished, East Indian people were brought as indentured servants; they now make up 3.9 percent of the population. The Creole and East Indian populations were integrated into the wider Belizean culture. Garifunas are 6.1 percent of Belizeans and have Afro-Honduran roots. Chinese people immigrated to Belize primarily to work in the sugarcane fields; Asians as a whole represent 1 percent of Belizeans (CIA 2016). Mennonites, who make up 3.6 of the population, immigrated after World War II to find land and escape religious discrimination. They adopt modern conveniences as needed, but otherwise hold to their traditions (CIA 2016; Kok and Roessingh 2015). Recent immigrants from Europe and North America further add to this cultural mix.

Many cultures intermingle in Belize, and people tend to think of themselves as Belizean before another culture, such as Creole or Maya. In fact, so great an intermingling of cultures has occurred that concerns are growing that individual cultural heritage is being lost. UNESCO held a five-day workshop on ways to preserve cultural heritage (Moody 2012). Most people in Belize are bilingual, with English, the official language, being the first language and spoken by 62 percent of the population. At 56 percent, more than half of the residents speak Spanish, which is taught as a second language in school. A significant number of people speak Belizean Creole (44%). Other languages include Maya (10%), German (3%), and Garifuna (or Garinagu, 2%) (CIA 2016).

The population is nearly evenly divided between women and men. Average life expectancy for the total population is 70 years for women and 67 for men. Migration continues to transform Belize's population. About 16 percent of Belizeans live abroad, often for financial reasons, while immigrants constitute approximately 15 percent of Belize's population (CIA 2016). Belize has a favorable immigration policy for retirees who emigrate from the

United States as well as from neighboring Guatemala and Mexico. Immigration accounts for an increasing share of Belize's population growth rate, which is steadily falling due to fertility decline. Belize's declining birth rate and increased life expectancy are creating an aging population (CIA 2016).

Belize has a public-private economy. Tourism is an important foundation of the economy, as are exports of marine products, citrus, sugar, bananas, and garments. Major efforts are being made toward agricultural diversification. Industrial development is encouraged through incentives that include tax holidays and import duty exemptions.

The labor force works in services such as tourism and call centers (71%), industry (15%), and agriculture (10%) (Martin 2015; CIA 2016). Belize's fishing industry is small and growing, with potential for development. In recent years, forestry has had a resurgence. Reforestation and natural regeneration in the pine forest and artificial regeneration of fast-growing tropical hardwood species are in progress (EOB 2016a). Mennonites, while only 3.6 percent of the population, produce more than 60 percent of the food in local stores (Girma 2011). Although Belize has the second-highest income per capita in Central America, it also has significant income disparity between the rich and the poor, with 40 percent (2013 estimate) of Belizeans living in poverty (CIA 2016).

Belize generates electricity domestically using firewood and other biomass products, including bagasse, a by-product of sugarcane. Belize has adopted renewable energy technologies and is connected to a power grid in Mexico. Recently, the Chalillo hydroelectric dam, covering about three square miles, was built on the Macal River in western Belize. Threats to the country's biodiversity include the expansion of commercial citrus and banana farms; agricultural practices such as burning; wildlife hunting; and extraction of timber and xaté (floral industry palm) (Fauna & Flora International 2014).

Overview of Women's Lives

While cultural norms and other structural barriers limit gender equity for women, they have seen improvements. In comparison to countries around the world, women's empowerment is ranked at 90th out of 188 countries, placing it in a high human development category. Empowerment is determined by reproductive health, political representation, and participation in the labor force (UNDP 2015).

Girls and Teens

The Labor Act of Belize sets the minimum age for work at 14. The Families and Children Act prohibits hazardous work for children under 18 years old; however, a shortage of inspectors hampers enforcement. Despite these structural protections, Belize faces ongoing problems with child labor; more than one-third of the child population works. Children work agricultural jobs after school and on weekends and may work with dangerous tools or chemicals. Children are also victims of forced prostitution and sex tourism, often by tourists from the United States (CIA 2016).

In 2008, the Belize Police Department initiated the Gang Resistance Education and Training program, where police officers work in classrooms to mentor teens. This has been successful in reducing violence and gang membership. A youth apprentice program has been established in Belize City to help teens find employment by working closely with businesses (Sanchez 2013). In 2012, young people in Belize from churches and civil organizations united to develop a proposal called the Prevention of Youth Involved in Violence in Belize 2012–2022. The proposed policy addressed the problems of violence against young people and the resulting effects from such violence (Interpeace 2013).

Childhood hunger is a problem in Belize. In 2011, 3.3 percent of children under five did not receive proper nutrition and were categorized as wasting (World Bank 2016). School meals are the only nutrition for some children, especially those from indigenous communities (World Bank 2013).

Teenagers are defying traditional thought by questioning traditional gender roles. They face the same problems as teens in many other countries, such as bullying, stress, and social pressures. They express themselves through blogging and are concerned with such societal problems as education, violence, and poverty (FLC 2014).

Recreation

Young women are participating more in sports and activities that were once the realm of boys. For example, the Belize Volleyball Association ran a free camp in the summer of 2014 for boys and girls. Girls and women participate in community activities that include walks for charity, bicycle races, book clubs and religious activities. They also participate in music and dance, and beauty and talent pageants are ubiquitous. It is not a part of Mayan culture

for women to relax; rather, more work should be found (Stepanek 2005, 57).

Education

Education is compulsory from ages 6–14. Primary and secondary schools are free; however, many families are unable to afford school fees or textbook and uniform expenses. Religious organizations and the government operate schools. Vocational training is available for those unable to complete secondary school. Combined with a lack of transportation in rural areas and a general shortage of trained teachers, educational opportunities may be limited or unavailable, particularly for indigenous women. The government has greatly expanded preschool education over the past five years and recognizes education as a basic human right.

Health

In its National Gender Policy, Belize articulates its commitment to women's and men's health with several goals: invest in primary and preventative health care, integrate sexual and reproductive health into the country's development and increase men's access to such services, support mental health services in local areas, and continue to expand access to care in rural areas among others.

Access to Health Care

To meet its goals, Belize relies on foreign medical providers, which fill the shortage of local health care workers, many of whom leave the country to find better opportunities elsewhere. With this arrangement, there are 72 doctors per 100,000 people (Catzim-Sanchez 2013, 15). Care is available through a network of over 30 hospitals, clinics, and other agencies distributed across the country.

Maternal Health

Because investing in women's education has a multipronged effect, children's health is correlated to the education level of the mother, not the father (Catzim-Sanchez 2013). Women have the right to birth control and the Ministry of Health and the Belize Family Life Association provide access to women's health services, including family planning. Belize's low maternal mortality rate of 28 per 100,000 live births (2015 estimate) is due in part to the fact that 96 percent of pregnant women received prenatal

care and benefited from having a skilled medical professional attend just over 96 percent of births (CIA 2016; UNICEF 2013).

Mayan women and children often live in poverty and suffer from anemia, malnourishment, and worm infestation (World Bank 2013). Mayan women also rely on the medicinal value of many plants.

Diseases and Disorders

Belize has the highest rate of HIV/AIDS in Central America with approximately 3,600 adults (2,000 women) infected. Young women become infected at twice the rate of their male peers (IFRC n.d.; Catzim-Sanchez 2013, 16). Poverty, drug abuse, and violence all contribute to the high rate of the disease. The Global Fund supports efforts in Belize to provide access to condoms and testing for sexually transmitted infections, and antiretroviral (ARV) drugs are available free of charge.

Women in rural areas are the most lacking in education on health issues, and outreach efforts have been made to this community, including the establishment of health centers (GOB-UNICEF 2011). Four percent of teenage pregnancies occur among girls 10–14 years old. In fact, the major cause of hospitalization among teenagers is due to a lack of obstetric care (Catzim-Sanchez 2013). In 2015, 6 percent of the entire population was undernourished, an increase of 1 percent since 2005 (World Bank 2016).

Employment

Services (71.7%), industry (18.1%), and agriculture (10.2%) are the largest employment sectors. Women participate less than men in the labor force. At 35 percent (2012 estimate), their unemployment rate is almost twice that of men (CIA 2016). Women work in many occupations, including teaching, where there are many Garifunas. Nursing and professional jobs such as law and accounting are often held by Creole women. Many government jobs, such as social work and law enforcement, are held by mestizos, who also predominate in small business and farming. Although the cultures have intermixed, Mayan women have not succeeded in moving to middle-class jobs, and many Creole women in Belize City have limited economic opportunity (Merrill 1992). It is difficult for women in either rural or urban areas to move out of poverty and unemployment and into the middle class. More women are completing higher education, and some women are entering nontraditional fields (Lewis and Vernon 2012, 53).

As of 2013, it was estimated that 4 out of 10 households lived in poverty, despite an unemployment rate of 12 percent (CIA 2016). Poverty tends to be chronic rather than temporary. Issues of alcoholism, absentee fathers, and gender-based violence compound the problem of poverty.

The law offers women protection from sexual harassment in the workplace, and cases are resolved through a labor complaints tribunal. In 2012, the labor commissioner received no complaints regarding unequal pay, though women and men tend to work in different occupations (U.S. Department of State 2012, 3). The minimum wage was recently equalized for jobs traditionally held by women; previously it differed by occupation. Belize subscribes to the construct of Equal Pay for Work of Equal Value and legislated equal pay for equal tasks (Catzim-Sanchez 2013, 29).

Family Life

Women are generally in charge of daily household affairs and raising children, and they are expected to obey their husbands. While cultural norms prescribe that women hold traditional family roles; mother and daughter relationships are typically close, which seems to benefit both parties (Anderson-Fye 2004, 582). There are laws that criminalize rape and spousal rape; but in actuality, many incidents are not reported, and those that are reported are often not prosecuted (U.S. Department of State 2012, 14). Women who speak out against these forms of male domination are often silenced through male ridicule. Though efforts to stop domestic violence have gained some traction in recent years, women are often still blamed for sexual misconduct, and rape is often viewed culturally as just another form of sex (Catzim-Sanchez 2013). In addition, women may feel the need protect themselves from sexual harassment by foregoing certain activities. For example, in 2014, interviews of young women revealed that many choose not to attend the annual Carnival celebration due to inappropriate touching (*Ambergris Today* 2012).

Politics

The government of Belize is a parliamentary democracy based on the Westminster system. The country is a sovereign, democratic state. A prime minister and cabinet comprise the executive branch, while a 31-member elected House of Representatives and a 12-member appointed Senate form a bicameral legislature. Her Majesty Queen

Elizabeth II is the constitutional head of state. A governor-general, who must be a Belizean and has always been a man, represents the Queen in Belize (CIA 2016).

The cabinet consists of a prime minister and other ministers and ministers of state who are appointed by the governor-general on the advice of the prime minister. The majority party in the House of Representatives selects the prime minister, and the governor-general appoints six senators. The speaker of the House of Representatives and the president of the Senate are elected. General elections are held at intervals of no longer than five years. There are six administrative districts. District administration is jointly run by a number of government functionaries. Each district town has a locally elected town council of seven members. The voting age is 18 (EOB 2016b). In support of their own community and practices, the Maya appoint an alcade or headman in each village to ensure their village laws are not broken.

As of 2012, there was only one woman in the House of Representatives, the sixth woman ever to hold such a position. Women have been gaining more representation in the Senate. In 2003, women comprised 25 percent of the Senate, and by 2012, that total had risen to 41.7 percent (Lewis and Vernon 2012, 47–59).

The political system makes it difficult for women to become elected to office. Government resources are filtered through politicians who show largess to those who are politically loyal. Women are responsible for maintaining their households and need these government resources. Therefore, they often support male politicians. Generally, in national elections, approximately 5 percent of the candidates are women (47–59).

Locally, prior to 1999, a woman generally held only 1 seat on the 9-member Belize City Council. From 2000 to 2009, 3–6 members of the 11-member council were woman. However, since 2009, only 1 woman has served on the council. The council appoints a mayor and has appointed 1 woman as mayor for two terms. The Belmopan City Council, established in 2000, includes 7 members, with 2–3 women holding seats (47–59).

Since 2000, women have consistently held approximately 20 percent of the seats available on town boards. However, since the towns began electing mayors in 2000, there has only been one woman mayor. She held the position for three terms. At the village level, the representation of women depends on location. In more rural areas, women may hold no seats on the village council. However, in the Belize District, women hold an average of nearly

three seats per council. Even in districts with the highest percentages of female town councilors, women hold less than 50 percent of the council seats (47–59).

The National Women's Commission published a Revised National Gender Policy that detailed five priorities: health, education and training, wealth and employment generation, violence producing conditions and power, and decision making. The policy's overarching premise is that everyone benefits when women are included in policy making and governance (Catzim-Sanchez 2013, 4).

The National Women's Commission developed a program titled Women in Politics to train women on how to run for office. In 2013, the Belize Women's Political Caucus launched a two-year action plan with the goal of gender equality in races and government by 2020 (Bowman 2013). From 2012 to 2014, the Strengthening Women's Representation in National Leadership in Belize Project focused on promoting women's representation in politics as a way to strengthen their economic and social status and aimed to institutionalize women's equal participation as representatives (UNDP Belize 2016).

Religious and Cultural Roles

Christianity is the primary religion practiced in Belize, with nearly 40 percent being Catholic and more than 30 percent Protestant, but the country is religiously diverse, with small populations of Mormons, Hindus, Muslims, Baha'i, and Rastafarian (CIA 2016). The Maya and Garifuna blended their traditional beliefs with Christianity. For example, the Garifunas maintain a *dugu* ritual to honor their ancestors, and some older Creoles practice *obeah*, or witchcraft (Merrill 1992).

In 1959, 3,000 Mennonites immigrated to Belize. They have a special agreement with the Belize government that includes exemption from military service. They are free to practice their own form of local government and run their own schools, banks, and businesses. Mennonites are culturally isolated, but they participate fully in the economy and provide many needed products (Minority Rights 2016).

Issues

Sexual Exploitation of Children

Sexual exploitation of children is a serious issue facing the government and people of Belize. In 2012, laws were enacted, including the Criminal Sexual Exploitation of Children Act, which increased penalties related to the

sexual exploitation of children. However, the act allows 16- and 17-year-old children to engage in sexual acts for payment. This fact, combined with a cultural history of families providing older children to much older men to provide income for the family, may lead to more sexual exploitation. Young women (ages 15–24) have twice the HIV rate as young men, whereas the trend is reversed for older women, underscoring the issue of intergenerational sex between young women and older men (Catzim-Sanchez 2013, 16). Poverty and its attendant issues of familial instability and lack of cohesion also contribute to exploitation (33).

Beauty Standards and Body Image

Belize has a tradition of beauty contests that provide upward mobility for girls and women. Women who win beauty pageants are considered successful and can leverage this success to improve their social status. Newspapers often prominently feature stories involving beauty contests. Women have used monetary and educational prizes from such contests to start businesses and to improve their lifestyles (Anderson-Fye 2004, 573). Girls from every socioeconomic class compete in beauty pageants, and body shape, rather than body size, is the most important aspect of beauty (562). In a 1997 study of Belizean teenagers, the ideal body size did not differ from their actual body size, unlike many cultures (567). This may be due to a widespread cultural belief among women to “never leave yourself,” which translates as caring for yourself despite external expectations, including sleeping late if sleep is needed regardless of missing class or having to attend detention. This also means eating when hungry and not starving or exercising until uncomfortable. This attitude is passed down to succeeding generations from woman to woman (577).

Women who work in the tourist industry tend to be thinner than women who work in rural areas and have no contact with tourists. The women view this as part of the job rather than being uncomfortable with their body image (579).

Violence against Woman

Violence against women is a problem in Belize. Most victims are aged 20–49 and may be married, in a common-law union, single, separated, or in a visiting relationship. Gender inequality compounds such problems because women often cannot leave an abusive relationship due to financial

considerations. The government has tried to address these issues by passing legislation, including the Domestic Violence Act and amendments to the Evidence Act, which is designed to protect rape victims at trial. Two shelters for women have also been opened, and police departments have established domestic violence units of varying size and quality. However, implementation of these laws is hindered by cultural norms, and only the Belize City Police Department has a complete domestic violence unit. Rural police departments often assign only one officer to this duty, resulting in a lack of resources and many uninvestigated complaints. Another hindrance to successful efforts results from the fact that most of the judiciary is male.

The government is attempting to address these issues through training and by increasing the number of women in law enforcement and the judiciary. The number of female police officers is increasing, and a woman is supposed to accompany a male officer to all domestic violence scenes. The National Gender Policy recognizes that violence affects women throughout their lives and individual events should not be considered in isolation. For both women as victims and men as perpetrators, violence should be addressed across the life cycle. Further, the government planned to upgrade its ability to collect data about gender-based violence to promote a multisectorial response that centralizes information about many forms of violence and its linkages to related issues (Catzim-Sanchez 2013, 38).

LGBT

In 2016, the Belize Supreme Court was the first Caribbean country to overturn its sodomy laws when it ruled in favor of Caleb Orozco, the executive director of the gay rights organization United Belize Advocacy Movement (UNIBAM). Joined by activists, allies, academics, and other supporters, he endured a six-year legal challenge before the Court recognized that the laws violated constitutional rights to dignity, privacy, and equal rights (Outright 2016).

UNIBAM is joined by other advocacy groups, such as PETAL: Promoting Empowerment through Awareness for Lesbian; Bisexual Women and Belize Youth Empowerment for Change, in working to counter cultural prejudice against homosexuality, as lesbians and transgendered women often suffer the same discrimination as gay men (U.S. Department of State 2012, 20). Prime Minister Dean Barrow vocalized his support for the LGBT community by stating that they should be treated equally under the law (Ramos 2016).

Drug Trafficking

Due to drug trafficking to the United States, violent crime has been increasing. In 2011, Belize was added to the U.S. list of countries considered major transit routes for illegal drugs and money laundering (BBC 2012; CIA 2016).

Celebrating Woman

March 8 is International Women's Day. Traditionally, Belize celebrated for a week rather than a day and recently increased the celebration to the entire month of March in an effort to highlight women's accomplishments and inspire women and girls to continue to advocate for their rights. Events include health screenings, including pelvic exams; art exhibits; walks; bike rallies; poetry readings; talks on women's issues; skills workshops, including plumbing, decision making, leadership, self-defense, parenting, and finances (Polanco 2015.).

Bermuda

Overview of Country

Bermuda, located in the North Atlantic between Great Britain and the United States, has been a British Overseas Territory since 1612. It is an archipelago of some 138 islands and islets, only 20 of which are inhabited. Seven are joined by bridges and causeways to the main island, Bermuda, which measures 20.5 square miles. It is the fifth-smallest country in the world, after Vatican City, Monaco, Nauru,

and Tuvalu. Located 564 miles southeast of Cape Hatteras, North Carolina, and 800 miles north of the Bahamas, it takes about two hours to fly from Bermuda to Miami (CIA 2016).

Historiographical records indicate that the Spaniard Juan de Bermudez, commander of the ship *La Garza*, discovered the island in 1505–1506 (Greene 1901, 221). In 1511, a map published in the atlas *Legatio Babylonica* included Bermuda. In 1609, Sir Thomas Gates, an Englishman and a future governor of Virginia, landed on the island after a fierce hurricane blew a small group of ships off course. The storm destroyed the ship, and another had to be constructed on the island from felled trees. This new boat, *The Deliverance*, took Sir Thomas to Virginia. Once word got back to England, interest was aroused, and the Virginia Company sent colonists from the British Isles to settle the island.

In 1611, the *Edwin* arrived in Bermuda from the West Indies. Among those on board were one Native American and one black African. Therefore, by 1616, each of Bermuda's main ethnic groups inhabited the island. By the middle of the 17th century, Bermuda had ceased to attract new colonists, but it had a thriving Creole population. By 1670, enslaved blacks became numerous enough that slavers did not continue to import enslaved Africans. In 1834, at the abolition of slavery, Bermuda's total population was 8,857; 4,687 were black and 4,181 white (CIA 2016).

During the 1960s, many Caribbean islands were granted independence from England, and colonial control was relaxed on others. The latter was the case with Bermuda. In 1968, internal self-government was granted to Bermuda, and a new constitution was introduced. The monarch of England remained the head of state, represented by a governor whose responsibility was limited to external affairs, defense, internal security, and the police, but now locals were elected to administer all other affairs. The first general elections were held in May 1968 under the new constitution. Racial and political tensions were exposed, culminating with the assassination of Governor Sir Richard Sharples in 1973. A few years later, in 1977, riots and demonstrations for civil rights broke out following the execution of the two black men convicted of Sharples's murder (Bernews 2016a). British forces were sent to restore order, and in 1978, a Royal Commission was set up to investigate the cause of the racial violence. In 1981, a Human Rights Act was introduced that prohibited racial discrimination. In 1997, Bermuda elected its first woman premier, Dame Pamela Gordon-Banks. Dame Jennifer

Smith, of the Progressive Labour Party, followed in 1998, holding the unique distinction internationally of a female premier who followed another.

Since the colonial era, Bermuda's population has grown to 64,237, of which 33,379 are female (GOB DOS 2015). In 2014, Bermuda's population was 53.8 percent black, 31 percent white, 7.5 percent mixed, 7.1 percent other, and 0.6 percent unspecified. Females accounted for roughly 49 percent of the population, 79 percent of whom were Bermudian and 21 percent non-Bermudian (CIA 2016).

Bermuda's population is fairly evenly spread across age groups: 17.5 percent are 14 years old or younger (male 6,165, female 6,031), and 12.2 percent are 15–24 years old (male 4,275, female 4,267). The most populous group is 25–54 years old, at 39.3 percent (male 13,706, female 13,741). Those aged 55–64 years make up 14.6 percent (male 4,813, female 5,368), and those aged 65 years and over are 16.4 percent (male 4,821, female 6,652) of the population. The major urban area, Hamilton, is the capital, where about 11,000 people live (CIA 2016).

Along with being the 10th most densely populated country in the world, Bermuda is one of the wealthiest countries and is rated as one of the top three jurisdictions in gross national income per capita (World Bank 2015). In 2012, the gross domestic product (GDP) per capita was estimated at USD\$84,470.76 (World Bank 2015). Bermuda also has one of the highest costs of living in the world. Although Bermuda has its own currency, it is pegged to the U.S. dollar, making one Bermuda dollar equivalent to one U.S. dollar.

Overview of Women's Lives

One of the most famous Bermudians is Mary Prince. Prince is the first known self-emancipated ex-slave to publish an autobiography. In the 18th century, Bermuda was prosperous for people of European descent, but less so for people of African and indigenous descent. Like most Caribbean islands, women's lives in Bermuda have been shaped by the experiences of slavery and colonialism (Prince 2008).

From 2011 to 2015, the Bermuda Statistical Department reported that women make up 49 percent of the labor force (GOB DOS 2016). The ratio of females to males in the workforce has slightly increased from 2000 to 2014 for low- and high-income brackets. In contrast, there has been a decrease in the ratio for middle-income earners. More men and fewer women are employed in a low- or a middle-income job. Seventy-two percent of low-income

women aged 15 and over were employed, compared to 83 percent of their male counterparts, while 48 percent of middle-income women were in the labor force, compared to 78 percent of middle-income men. Among high-income earners in 2014, 52 percent of women and 69 percent of men were gainfully employed (World Bank 2017). Bermuda is not included in global rankings such as the Gender Inequality Index (GII).

Girls and Teens

Bermuda has a relatively high rate of teenage pregnancy. Of women aged 15–64 in 2010, the total number who gave birth for the first time was 13,890; of this, 3,042 were women under 20 years of age. This figure represents about 22 percent of first-time mothers and is a drop of 4 percent among teens since the 2000 census, when the rate of teen pregnancy was 26 percent. In contrast, out of 1,296 reported first-time fathers, only 915 (8%) were under 20 in 2010 (WHO 2017).

As of 2016, 35.7 percent of the youth population (15–24 years old) were unemployed; of these, 36.5 percent of females (2012 estimate) and 34.8 percent of males aged 15–24 were unemployed (CIA 2106).

Education

The link between the level of education and median gross income shows that as educational level increases, so does income. Overall, women earn 80 percent of what men do at the same education level. However, this statistic is misleading. As education level increases, the income gap between genders widens. While a female who graduates with a basic-level certificate earns 95 percent of what a male does, a woman with a doctorate degree earns 57 percent of what a man with a doctorate earns (GOB DOS 2010, 170).

Such disparity is not peculiar to Bermuda; however, Bermuda's educational system reinforces historical and entrenched inequality. The majority of black Bermudians attend public schools, while the majority of white Bermudians attend public schools (Jethwani 2015). This segregation represents the persistence of the plantation and colonial mind-set that the Bermudian government seems not to have fully overcome. Education is controlled by the Ministry of Education and is free if the pupil is attending a public or state school, as 60 percent of children on the island do. Education is compulsory from the ages of 5–16. There are 18 primary schools, 5 middle schools, and

2 secondary schools. There is one tertiary institution, Bermuda College, that offers associate degrees, diplomas, and certificates (GOB MOE 2016).

A 2007 review of Bermuda's school system found that about one-third of public schools were effective and that, as a group, the middle schools were least effective. Many students do not make the progress they should (Hopkins et al. 2007, 5–6). The reviewers from the University of London noted that primary school students made a “slow start” and “insufficient progress” in middle schools, and therefore students achieved standards that were “too low” by the end of this stage. Consequently, secondary schools were less than effective, contributing to low graduation rates and poor standards. Exacerbating this gap, public schools award students with the Bermuda School Certificate upon completing grade 12. However, private schools can offer the higher valued International Baccalaureate and the General Certificate of Education (GCE) from Cambridge. Such inequity denies public school students access to the same qualifications (8).

The government has tried to intervene to effect better outcomes. The minister of education, Wayne Scott, said, “A transformation is occurring” (Bernews 2015b), which includes access to more certificates for public school students. Public school students can now take external examinations at the end of their school careers, including the International General Certificate of Secondary Education (IGCSE), the General Certificate of General Education, Advanced Subsidiary, and Advanced Level examinations. All are Cambridge-administered exams. Beginning in 2015, to earn a Bermuda School Diploma, students must obtain, among other requirements, a total of 24 out of 28 credits, have a minimum cumulative GPA of at least 2.0, and pass an IGCSE in English, mathematics, and science.

A recent study reported that of 216 graduates from the Bermuda Public School System, 67 percent were girls, and 37 percent were boys. This total number represents a 92 percent pass rate for the 2014–2015 school year. Of the 216 graduates, seven students graduated with a GPA above 3.67. The graduation rate of 37 percent for boys confirms other research that about 50 percent of black males enrolled in secondary schools drop out of school (Duncan 2015; Mincy 2007). High unemployment among black Bermudian men is related to their low enrollment in school (Mincy 2010, i). Black Bermudian men are also more likely to be employed in lower-wage jobs (underemployed) compared to their peers (13). About 14 percent of young black males are “on the wall”—not in training,

education, or employed, compared to 8 percent of young white males (i). At the same time, black Bermudian men aspire to attend college, preferably overseas, and those who graduate from high school are likely to attain some college (121). Despite attaining education, black Bermudian women, constrained by sexism and racism, end up earning less than their male peers (iii).

Black Bermudian girls are more likely to graduate and attend college, while about half of black Bermudian males leave public high schools before completion. In 2006, black males represented 34 percent of young people 16–30 years old who did not meet minimal skills standards, where 26 percent were young black women, 15 percent were white Bermudian men, and 18 percent were white Bermudian women (Jethwani 2015).

Health

Access to Health Care

The public regards Bermuda's health care system very positively. In 2005, 71 percent felt the system was excellent or good. Furthermore, two out of three residents reported being able to see a physician within 24 hours of seeking care (Ramella 2005, 3). Bermuda's organizational model for health services is made up of loosely linked private and public subsectors. The private for-profit subsector plays a large role in both service provision, especially primary care, and in financing, in particular health insurance-based funding. In 2000, 95 percent of Bermuda residents were covered by health insurance (4). The public sector delivers most population-based services, some preventative and primary care, most nonpersonal services, and most of the secondary care and psychiatric care provided in Bermuda is through their two hospitals. The contributions of nonprofit organizations are proportionately small.

Although health care costs are enormous compared to Canada and the United Kingdom, they are about the same as the United States for working newcomers below retirement age. Bermuda has no equivalent of the U.K. or Canadian National Health Service, so local taxpayers pay for services. In fact, they pay several times for health care, including rebuilding the King Edward VII Memorial Hospital, the operational costs of the government's Ministry of Health, and for employer and employee health and hospital insurance. Only local majority-Bermudian-owned insurers can be used. Despite being nominally British, Bermuda follows the American pattern of charging for general health care, general practitioner consultation rates, health

care and medical insurance, hospital stays, and medications. There are separate charges for dentists.

The Bermudian government has a high expenditure for health care. Life expectancy is about 81 years for women and 78 years for men. However, disparities in life expectancy by race, insurance coverage, and distribution of health financing, in particular for low-income, senior-headed, and black households, reflect inequities (Ramella 2005, 4).

Maternal Health

The country offers a comprehensive maternal health care system. Another area of excellent quality is the prevention, detection, and care of communicable diseases. The Ministry of Health provides a Maternal Health and Family Planning Clinic that cares for women of childbearing age. For example, women attending the clinic are offered services such as pregnancy tests; birth control, including the morning after pill; tests to detect sexually transmitted disease; and cervical cancer screenings. Breast examinations are also offered as well as childbirth classes. The clinic also offers women's health talks for the community (GOB MOHS 2017).

Diseases and Disorders

There has been a decrease in HIV cases in recent years (e.g., 20 new cases in 1999, 15 in 2001, and 10 in 2003). Highly active antiretroviral therapy (HAART) was made universally accessible in 1998 through a program led by the Ministry of Health and Family Services. Although the rate of infection is declining, Bermuda reports a high rate of HIV/AIDS; 767 persons have been diagnosed with HIV in Bermuda since 1982. Of these, 565 persons have had a diagnosis of AIDS, and 464 have died either from or with HIV infection. As of December 31, 2015, there are 303 persons known to be living with HIV; the overall prevalence is 0.49 percent (GOB MOH 2015). Diagnoses have consistently declined from a peak in the early to mid-1980s. Over that period, 190 women and 577 men were diagnosed with HIV; 130 of the women and 435 of the men have died. Of the 303 people presently living with AIDS, 87 are women (GOB MOH 2006).

The 2010 census captured self-reported information about people with long-term health conditions; 25,881 reported a health condition. Fifty-four percent of these were female. The 10 most common problems were "seeing difficulties," hypertension, asthma, arthritis, type 2 diabetes,

back problems, heart conditions, cancer, and stomach and kidney problems, or liver problems. The main effects of disability include being limited in activity at home or at school, being unable to work, or being limited in the kind and amount of work that can be performed. Women represented 56 percent of the total number of these kinds of reported disability impacts and exceeded the number of males in every category (GOB DOS 2010).

Employment

Bermuda is a tax haven. The government records 3,222 local companies and 12,965 international companies. In 2014, international business activity and business services provided the highest percentage of jobs. Public administration and education provided the next highest percentages, respectively. Tourism also accounts for a relatively large portion of revenue. About 4,500 jobs are generated by tourism and related fields. Women account for 49 percent of the workforce. Bermudians tend to hold more jobs in the nonprofessional sector than their expatriate counterparts. Jobs include hotel work, domestic cleaners, construction, retail, and repair services (bermuda4u.com 2017).

Bermuda's tax-haven status is a boon to the economic development of this British colony. Bermuda is one of the world's most prosperous countries largely because of its offshore finance industry. Beaches, golf courses, colonial buildings, and the subtropical climate also attract some half a million tourists a year; even so, the self-governing territory did not escape the global economic recession that began in 2008. The Bermuda government conducts an annual employment survey, which is a census of all businesses on the island. Its findings indicate that this recession and long-term government policies have had a debilitating impact on the most vulnerable population—women who earn a low income.

In 2014, the total number of jobs filled by Bermudians fell by 3 percent, and in 2015, the number fell another 1.1 percent. However, financial intermediation jobs increased by 5.1 percent. Overall, there were 33,475 jobs in 2014. Women accounted for 49 percent of the labor force, or 16,483 women, while 16,992 of males were employed comprising 51 percent of the labor force. This ratio was the same as the previous year. Of this number, 23,833 were Bermudians, down from 24,504 from the previous year (GOB DOS 2016).

Bermuda boasts an extremely high standard of living; depending on the year, it is ranked as sixth in per capita

income (CIA 2016). The unemployment rate was reported at 35 percent among adolescents and 9 percent among adults (2012 and 2014 estimates) (CIA 2016). According to 2013 estimates, 83 percent of Bermudians work in the service economy. Other sectors include industry, which employs 15 percent, and agriculture, which employs 2 percent (CIA 2016). This indicates that much of the workforce is engaged in relatively low-paying work (agriculture and fishing, laborers, clerical, and possibly sales), and this may contribute to why 11 percent of the population lives below the poverty line (2008 estimate) (CIA 2016). Bermuda's low-income threshold is more than double that of the United States. Given the high cost of living and the limited opportunities for well-remunerated employment, it is not surprising that, in 2008, a study commissioned by the Government of Bermuda found that shelter or housing accounted for almost 60 percent of an average household's income. Low-income families find it extremely hard to meet basic standards of living in this wealthy country where absolute poverty accounts for 11 percent of households (GOB DOS 2008).

In 2013, the median salary in Bermuda was \$69,183, and the average in the banking and international business sector was estimated at \$89,896. Black people hold 64 percent of existing jobs in public administration (government, police, etc.); 29 percent in hotels; 24 percent in banks; 18 percent in restaurants and bars; 9 percent in international or exempted companies; and no jobs in the wholesale trade. Though blacks are a majority of the population, they are very much underrepresented in the private sector and slightly overrepresented in public administration. The private sector commands the highest pay. In 2010, the median annual pension received by men was \$19,385. Women received an annual pension of \$12,132 (Forbes 2017b).

There is no minimum wage in Bermuda. Those who cannot make ends meet, including many single-parent families and those who have a permanent disability, are likely to become impoverished. The Ministry of Health and Social Services distributes some government financial assistance to Bermudians who are pensioners, who are not homeowners, who do not have a job or any private income, and who have virtually no savings. Also eligible for government assistance are single-parent families who meet the qualifications stipulated by the government, certain others (on a discretionary basis) who have a permanent mental or physical disability, certain able-bodied but unemployed or underemployed individuals not earning sufficient income to live on, and those who are born locally or overseas and

are twins or triplets or other multiple birth sibling. There is also a housing allowance program for Bermudians who face temporary rent payment difficulties because the vast majority of all properties are exceedingly expensive to buy or rent.

The 2010 personal income census indicates that the median income for women is 9 percent lower than for men. In addition, whites reported a 30 percent higher median income than blacks, and non-Bermudians earned a 20 percent higher median income than Bermudians. Non-Bermudian men earned the most of all groups, earning 24 percent higher than Bermudian men. Non-Bermudian women earned more than their local counterparts; expatriate women received median incomes that were 15 percent higher than local women. Furthermore, non-Bermudian men earned median incomes that were 14 percent higher than non-Bermudian women, and Bermudian men earned 6 percent higher median incomes than Bermudian women. In general, black Bermudian women are at the bottom of the income scale, making them vulnerable to poverty and concomitant social and economic woes (GOB DOS 2012a).

The Bermuda government's study *Low Income Thresholds for Bermuda Households in Need* places the poverty line at incomes of less than \$27,000 per year for a single person and \$76,000 for a two-parent family with two children under the age of 16. The study found 11 percent of households fell below the new threshold, which equates to 3,050 homes. The highest incidence of low-income households occurred for single- and two-parent households with young children and in elderly adult households (GOB DOS 2008).

In October 2012, 10,000 residents, over 25 percent of the workforce, were either unemployed or underemployed. Those hit hardest by job loss were "other non-Bermudians" (GOB DOS 2012a).

Women suffer disproportionately from the job losses, with the number of females in the workforce declining by 780 to 17,723, compared to a drop of 543 in the number of men to 18,151. The statistics also indicated differing labor market fortunes for blacks and whites. The number of blacks in the working population fell from 20,171 in 2010 to 17,229 in 2012. In contrast, the number of whites increased from 11,312 in 2010 to 13,237 in 2012. Blacks accounted for 48 percent of the working population; whites comprised 37 percent. People of mixed and other races accounted for 14 percent, while 216 workers did not state their race (GOB DOS 2012b).

Men earned a median income of \$60,156, maintaining their earnings advantage over women, who took home \$57,322. Whites' median income, at \$71,751, was around \$20,000 more than that of both blacks (\$50,799) and mixed or other races (\$53,191) (GOB DOS 2012b).

Bermudians earned \$54,550, less than non-Bermudian spouses of Bermudians (\$69,378), other non-Bermudians (\$87,089), and permanent residents (\$74,499). Workers in the international business sector were the highest paid, with a median income of \$114,951, followed by financial intermediation (\$74,231) and electricity, gas, and water (\$69,068). The lowest-paid sectors were restaurants and bars (\$33,471); "other community, social and personal services" (\$35,017); and retail and repair services (\$40,751) (GOB DOS 2012b).

These data indicate that women are less valued in the workforce than men. However, women make up the bulk of single households. Single women with children are more likely to be threatened by financial insecurity than men. This is more likely to happen to black women. For instance, according to the 2010 census the median monthly rent in Bermuda was 1,700, while the median monthly mortgage was 3,500. Consequently, single women with children who earn low wages will struggle to find shelter and meet basic living expenses (GOB DOS 2010).

In 2013, Rolfe Commissiong, a member of Parliament, noted that an official figure of 9 percent unemployment for blacks and less than 2 percent for whites suggested underreporting. He argued that the unemployment rate for blacks was higher, possibly 15 percent. Either statistic indicates an underlying fact that white women appear to have more access to jobs, though they may compare less favorably to white men's, who tend to control the reins of corporate and political power (Bernews 2015a).

Family Life

The 2010 census of population and housing, conducted by the Department of Statistics, was the second to collect data on families in Bermuda. The first was in 2000. The government considers a person black based on the presence of black heritage, irrespective of whether the person's heritage includes another race, and this also applies to people who are considered white. White is based on the presence of white heritage, irrespective of whether a person's heritage includes another race. Further, a family is deemed the race of the head of the family, regardless of an individual member's race. This same structure applies when defining a family as Bermudian or not (GOB DOS 2006).

The median household income in 2010 was \$106,389. This represents a 48 percent increase over the 2000 figure of \$71,622. However, this means that almost 50 percent of households earned less than the median income. The spike in the cost of living over the last 25 years is the result of the high salaries paid by the financial sector (\$144,000 and over) (Bermuda4u.com 2017).

The 2010 census found that of 29,107 families, more than 50 percent of black female-headed households with children were living at or below the poverty line. Poverty in households headed by single females is important because it has a multigenerational impact on children. This is the situation for many single-parent black households in Bermuda today. In this situation, children grow up without a basic nutritional diet, sufficient education, or a safe and secure community to protect them from drugs, gangs, and violence.

Many single women who head households work in the hotel and restaurant industry at lower end of the job scale. Low educational attainment leads them into low-paying jobs where they do not earn enough to meet the high cost of rents and pay their bills. This means that many women form part of the working poor. Their electricity may be cut off. Without electricity, women are forced to buy already prepared food, which is often unhealthy. The psychological cost of poverty—anxiety and the inability to buy healthy foods—leads to poor eating habits, contributing to obesity and possibly other health problems. This can deepen poverty due to associated health costs and can become a vicious cycle.

In 2013, the Coalition for Child Protection experienced a tripling of mothers seeking its assistance for food aid, payment of utilities and medical bills, and the purchase of school uniforms. Many people tend to blame the women themselves for their poverty and assume they are irresponsible or unable to budget. However, in reality, women who are underpaid or unemployed simply do not earn enough to meet their financial commitments, rising costs, or Bermuda's higher living costs.

When single mothers living in government housing fall behind on their rent, the Bermudian Housing Agency evicts them and their families, leaving them nowhere to go. Furthermore, the eviction process is humiliating. The agency uses the police and government officials to evict the families. For example, one family was evicted by five individuals from the Bermuda Housing Corporation, six individuals working as government movers, and five police officers. All were male. The woman was made to "feel like

a criminal," rather than as a homeless person wanting somewhere to go. To add insult to injury, the house from which she was evicted is still unoccupied. In such situations, innocent children are the victims of poverty and of the indifference and insensitivity of officials unwilling to find solutions to problems.

The government has made some efforts to respond to the housing crisis by constructing housing developments for the middle class. To begin addressing the housing crisis for families with low incomes, Gulfstream, a dormitory-style transitional complex, was made available in 2007. In 2012, there were more than 100 families living there. Each family has one room to call home. The rent is \$540 per month. There are three floors, and each floor has 30 families and one kitchen with three stoves and two sinks. The children have no playground. There is a no-babysitting rule, so mothers sometimes must give up work to stay with their children because they cannot afford nursery care.

The incidence of households falling below the low-income threshold is the highest for single-parent households with one child—roughly 14 percent. Around 11 percent of two-parent households with one child fall below the poverty line. Adult couple households are the least likely to be low income (GOB DOS 2008).

Women are less well off in Bermuda than their male counterparts. Households headed by men report an 11 percent higher income than those headed by women. Furthermore, single-parent homes with one child (15.6%) and two-parent homes with two children (15.9%) were the households most likely to fall below the relatively low income threshold (GOB DOS 2008).

It must be noted that the vast majority of all single-parent households are headed by women; these women are overwhelmingly black. This means that close to 11 percent of single black mothers live below the poverty line and that about 15 percent of single mothers earn below relatively low incomes. In fact, at the time of the 2000 Census, 50 percent of black female-headed households with children were living at or below the poverty line. The fact that they are likely to have one or two children makes this an even greater indication of the extent to which they are disadvantaged.

On June 19, 2015, the Honorable Patricia Gordon-Pamplin, the Minister for Community, Culture and Sport, announced to the Bermudian Parliament that the Financial Assistance Regulations would be amended. This was a recognition of the fact that over that fiscal year

Table 1 Bermuda Financial Assistance

Category	Approximate # of Persons Receiving	Amount of Payout (Monthly)
Able-bodied unemployed	567	\$808,144
Disabled	797	\$1,343,716
Earnings Low	442	\$423,058
Pensioners/ Seniors	859	\$1,791,377
TOTAL MONTHLY PAYOUT	2665	\$4,366,295

Source: GOB (Government of Bermuda) Assistance. 2015; Gordon-Pamplin, Patricia. The Honourable Minister of Community Culture and Sports. Amendments to the Financial Assistance Regulations. 2015. Ministerial Statement to the House of Assembly. <http://www.parliament.bm/uploadedFiles/Content/Home/Amendments%20to%20the%20Financial%20Assistance%20Regulations%202015%20-%20P%20Gordon-Pamplin%20-%20June%2019%202015.pdf>

approximately 1,678 persons had been identified through the Department of Financial Assistance as new applicants seeking a financial award, an average of about 140 persons monthly, or approximately 7 people per day. The minister explained that during the previous year, the total number of clients serviced by the department fluctuated monthly, and the numbers ranged from a low of 2,462 persons to a high of 2,727 persons.

Over the last 10 years, the number of people requiring assistance increased by 400 percent, and the budget to the department increased by 300 percent (Gordon-Pamplin 2015). As of 2016, those 65 and older are 17.3 percent (male 5,195, female 7,102) of the population (CIA 2017). To make the case for senior support, Gordon-Pamplin presented data, such as in table 1, in support of the amendment to the legislation.

Some believe that despite Bermuda’s affluence, its seniors receive significantly less than what other wealthy countries offer their seniors (Forbes 2017).

An analysis of child care arrangements by race shows that 60 percent of black children aged 5 years and younger were cared for during working hours at nurseries, day care centers, or preschools compared to 45 percent of white children and 51 percent of children of mixed and other races. The cost of weekly child care varied from \$259.50 to \$169.40 per week. Child care fees vary by whether the facility is public or private, location, the type of care offered, and any extra services.

The above data demonstrates that stymied opportunity and persistent poverty among black women is much higher than among any other group in Bermuda. Marked social inequality along gender, class, and racial lines means that black women may experience a triple jeopardy.

Politics

Although Bermuda is under the sovereignty of the United Kingdom, it is self-governing. Bermuda has its own constitution and locally elected government. Governors appointed by the British monarch are responsible for external affairs, defense, and internal security, including oversight, through the commissioner of police, of the national police force. The Bermudian government is consulted on any international negotiations affecting the territory. Bermuda participates, through British delegations, in the United Nations and some of its specialized and related agencies.

Bermuda has a parliamentary system of government. The premier is the head of the government and the leader of the majority party in the House of Assembly. The cabinet is composed of ministers selected by the premier from among members of the House of Assembly and the Senate. One representative from each of the 36 districts is elected to the House for a term not exceeding five years. The Senate, or reviewing house, serves concurrently with the House and has 11 members, 5 appointed by the governor in consultation with the premier, 3 by the opposition leader, and 3 at the governor’s discretion. The judiciary is composed of a chief justice and associate judges appointed by the governor. For administrative purposes, Bermuda is divided into nine parishes, with Hamilton and St. George considered autonomous corporations.

Bermuda has had two female heads of government, or premiers; currently, 6 of the 11 Senate members are women, including its vice president, Joan Dillas. Of the 11 cabinet members, 2 are women: the minister of home affairs and the minister of health and environment. Additionally, 6 women were elected to the House. With one exception, all are black women.

In November 2013, the Ministry of Community, Culture and Sports, through the Department of Human Affairs, was charged with crafting a national gender policy that would build a more “inclusive” Bermuda by “removing impediments and barriers wherever they exist” (Stevenson 2013). However, there is no strong evidence that this has been achieved.

The Bermuda Community Foundation (BCF) noted that the last report on gender was in 1997. The BCF's major objectives in 2016 included the establishment of a Gender Project Fund Initiative. The foundation received funds from a donor who was concerned about the few statistics about gender. The initiative supports a government-led project to gather information that will form the basis of future national gender policy.

Religious and Cultural Roles

Bermuda is considered a primarily Christian country. Forty-six percent of Bermudans are Protestant, which includes 15 percent Anglican, 8 percent African Methodist Episcopal, and several other denominations. Fourteen percent of Bermudans identify as Roman Catholic, almost 18 percent have no affiliation, and 6 percent did not specify (CIA 2016).

Along with freedom of religion, Bermudans observe separation of church and state. While citizens and foreigners are welcome to practice the religion of their choice, some people express only tolerance of nonpractitioners. Good Friday, Christmas, and Boxing Day (the day after Christmas) are celebrated as national holidays (World Trade Press 2010, 10).

Issues

LGBTQ Rights

As in many Caribbean countries, lesbians, gays, and transgendered people face challenges. There has been some progress across the Caribbean with the expansion of LGBTQ rights; yet, the legal status of these rights remains underdeveloped. Some scholars maintain that economic development plays a role in the advancement of these rights; however, for Bermuda, this has not been the case (Corrales 2015). Despite the existence of pro-LGBT organizations such as the Rainbow Alliance, a June 2016 referendum resulted in an overwhelming number of voters rejecting gay marriage. Official reports indicate that 20,804 people (47%) of the population, took part in the referendum. Results showed that 69 percent of those who voted, 14,192 people, opposed same-sex marriage, and 6,514 voted in favor (Jones 2016). The Rainbow Alliance of Bermuda and the Centre for Justice disagreed with the Bermuda government's decision to hold a referendum on the issue. They contended that human rights are not optional, and, consequently "a referendum is an inappropriate method for making human rights decisions" (Bernews 2016c).

Drug Use and Crime

One issue Bermudians face is the prevalence of drug use. For example, in 2009, the UN Office on Drugs and Crime (UNODC) *World Drug Use Report* cited Bermuda as the country with the sixth-highest prevalence of marijuana use and eighth-highest of cocaine use; the Bermudian government disputed these figures. In 2016, the Department for National Drugs Control reported that the current prevalence of drug use among students ranged from a low of 5 percent among middle 2 (grade 7) students to a high of 54 percent among senior 4 (grade 12) students (2). Students reported that drugs were easily attainable. Male students were twice as likely to have used illegal drugs as their female counterparts, although marijuana prevalence was the same for both girls and boys. However, girls were more likely to use alcohol; 55 percent reported using it at some point in their lives, compared to 50 percent of boys. Twenty percent of girls reported current use, compared to 16 percent of boys (GOB DNDC 2016).

In 2014, data reported by the Maternal Health Clinic found that 41.9 percent of pregnant women had used one or more illicit drugs during pregnancy (GOB DNDC 2015). A 2015 national survey sought to ascertain alcohol, tobacco, and marijuana use among 238 pregnant women while under prenatal care. Women's ages ranged from 16 to 34 years of age. Most of the women (45%) were in their third trimester, while 38.2 percent were in their second trimester. Slightly less than half of the women (116) indicated they had never had a drink. Another 73 indicated they had a drink once a month or less. Twenty-nine women reported drinking two to four times a month, and 20 women said they drank two to three times a week. The survey found a strong likelihood of hazardous or harmful alcohol consumption related to binge drinking, and a small but important proportion of the women were current smokers of both cigarettes and marijuana. Most of the women who smoked stopped during pregnancy. Surprisingly, some (41.6%) thought that smoking cigarettes was not harmful to one's health and indicated that health providers had not warned them about smoking's harmful effects (GOB DNDC 2015).

Given the importance of tourism to the country, the government has worked diligently to reduce the country's crime rate, mostly by intensifying its anti-gang activity. By the end of 2015, according to statistics provided by the Bermuda Police Department, the total number of crimes reported to the police was 3,750. This is an appreciable

decline from a high of 5,550 in 2008 demonstrating some success (Bermuda Police Service 2015).

A significant number of the incarcerated are young black men from low-income and underresourced educational backgrounds. They are also likely to be single, with one or more children. Such violence takes a toll on those most vulnerable, primarily low-income black women and their children, whether they are the relatives of the victims or the incarcerated. With an average household size of 2.21 and an average number of workers per household of 1.21, the loss of one member's earnings affects the household overall (GOB DOS 2014). The burdens of incarceration fall on women who are left to raise families and can lead to the separation of parents and a loss of family income. Women are also left to cope with children who are at greater risk of developmental delays and behavioral problems (Western 2003).

Sexual Assault

Bermuda's Constitution protects women against violence, as do laws passed in Parliament and "the common law." The common law refers to judge-made laws derived from centuries of precedents and statutory interpretation by judges. The laws criminalize rape, spousal rape, domestic violence, and sexual harassment (UN Women n.d.). Collectively, Bermuda's laws protecting women and girls are comprehensive and progressive.

The police recorded 33 cases of sexual assault in 2011, 26 in 2012, 31 in 2013, 30 in 2014, and 35 in 2015. The Sexual Assault Response Team (SART), a community-based coordinated response team for survivors of sexual assault, is seeing an increase in reported incidents, most by adolescents. Nineteen cases (mostly females) were reported to the team in 2014. Five victims were under the age of 12, and five were teenagers (Simpson 2015). A SART team consists of forensic nurses and services from the Bermuda Police Service Department of Child and Family and the Centre against Abuse. They provide immediate on-site response to a survivor of rape. SART also promotes awareness and coordinates sexual assault training, among other activities (Simpson 2016). The Centre against Abuse and the Women's Resource Centre also offer counseling and training, and they advocate for an abuse-free society through education and prevention.

Conclusion

Mary Prince unwittingly described the condition of Bermuda's women in these terms: "My master was a very

harsh, selfish man. . . . His wife was herself much afraid of him and during his stay at home seldom dared to shew her usual kindness to the slaves" (Prince 2008, 6). Some 316 years later, life is much better for all women in Bermuda. Yet, the hierarchy remains. And so women's lives are still circumscribed by race, class, and gender.

Bolivia

Overview of Country

Bolivia is a landlocked country in South America sharing its border with Argentina, Brazil, Chile, Paraguay, and Peru. The geography and climate is varied, ranging from the cold, arid altiplano (highland plateau) region in the Andes Mountains to the hot, humid Amazon Basin's lowland plains. Of the 418,265 square miles (1,083,301 sq. km) of land within Bolivia, only 495 (1,282 km) is irrigated, and less than 3.5 percent is arable land (CIA 2014a). Despite the lack of suitable farming land, Bolivia is the world's third-largest producer of cocaine (Heritage Foundation 2015).

Bolivia is named after Simon Bolivar (1783–1830), also known as *El Libertador* (the Liberator) because of his work in the resistance and eventual overthrow of Spanish rule in Bolivia, Peru, and Gran Colombia (present-day Colombia, Venezuela, Ecuador, and Panama) (1811–1825). The two largest populations in Bolivia today are the Quechua (30%) and mestizo (30%) (CIA 2014a). The Quechua are Andean peoples living in Bolivia, Peru, and Ecuador. Today, there are many regional variants of the Quechua language, which has an ancient pre-Incan origin. Because it was the administrative language of the Incan Empire, it became the common language of the Spanish and Indians in the Andes region.

Mestizo is a term for any person of mixed indigenous and European ancestry. The Aymara are the second-largest indigenous population in Bolivia, making up 25 percent of the population (CIA 2014a). This indigenous group mainly resides in the Altiplano region of Bolivia and Peru. There are smaller populations of Aymara in Chile and Argentina.

The Aymara peoples were conquered by the Inca in the 15th century; however, they have been in an almost continual state of revolt since then, first against the Inca and then against the Spaniards who conquered the Inca. The remaining Bolivian population is identified as white. The 2009 constitution states that Spanish and all indigenous languages are official languages of Bolivia, and it lists 36 indigenous languages, including some that are extinct (CIA 2014a).

Most scholars identify ethnic, gender, and rural barriers to equality in education, health care, and jobs in Bolivia. For women and young girls in rural regions, the burden of restrictive agricultural and home duties makes it difficult for them to remain in school when they are young or to participate in government as adults (Gottardo and Rojas 2010). In 2006, the Convention on the Elimination of All Forms of Discrimination against Women (CEDAW) found that access to education for rural girls had improved dramatically; however, keeping girls in school was a problem. Recent research found that the wage gap between ethnic groups was likely due to limited educational opportunities in rural areas rather than because of endemic ethnic discrimination in the workplace (Canelas and Salazar 2014).

The majority of Bolivia's population is urban (66.8%), and urban areas are growing by 2.18 percent each year. This is similar to China (2.85%) and nearly twice as rapid as the United States (1.14%) (CIA 2014a). An urban location does not guarantee a good education for Bolivian women. In fact, in 2009, 3 out of every 10 Bolivian women were illiterate, compared to 1 out of 10 Bolivian men (Harbitz and Tamargo). The gap widens when discussing indigenous women and men.

Overview of Women's Lives

The Gender Inequality Index (GII) for Bolivia was 0.444 in 2014, which placed it at 94th out of 155 countries (UNDP 2015b). The GII is based on inequality in reproductive health, empowerment, and economic activity. Reproductive health is measured by the number of mothers who die due to pregnancy-related issues and the number of children birthed by adolescents. In Bolivia, for every 100,000 live births, 206 women die due to pregnancy-related issues, and for every 1,000 adolescents (ages 15–19), there are 78.2 births. Empowerment specifically refers to women's representation in government and participation in education at a secondary level or higher. Bolivian women hold 51.8 percent of the seats in parliament, and 47.6 percent

of adult women have attained a secondary or higher level of education. Economic activity references participation in the workforce; 64.2 percent of Bolivian women participate in the workforce (UNDP 2015a).

Girls and Teens

Most children are expected to work. Almost 89 percent of all Bolivian children ages 7–14 contribute unpaid labor of some type to their families (Index Mundi 2015). In urban areas, this work can be in the home or outside of the home for wages. In rural settings, older girls will usually help care for younger siblings, participate in cleaning and cooking, and care for livestock or crops.

Whether by their own labor or wages earned outside the home, many women of all ages in developing countries make significant contributions to food security for their families. Women's participation in food production and economic security has negative and positive aspects for young women and children. The time children are expected to spend tending to chores or working for wages pulls them away from their studies and often removes them completely from school at an early age. One positive outcome for the work done by women is that it is considered valuable whether it consists of caring for the home and children, producing food through agricultural activities, or for working outside the home for wages and thus gives women a more powerful voice when making decisions that affect the family, especially decisions about education for their children (Valdivia 2001, 36). This ability to influence decisions made in the home provides an example to girls that they are not powerless.

Education

The amount of education individuals attain is affected by many factors. Rural residents attended school for more years (9.23) than urban residents (7.43), and women attended school longer than men (8.24 versus 4.19 years) (UNICEF 2015). It is possible this is due to a need for urban residents and men to seek wage work from an earlier age.

The 1995 CEDAW report found that bilingualism was also a factor in educational attainment. The Bolivian government has experimented by providing instruction in the Guaraní language, the most prevalent aboriginal language in rural areas (42.6% of rural residents). With this change in delivery modality, girls, who were more likely to be monolingual than boys, were staying in school longer

even when from poverty-level families (CEDAW 1995, 5; UNICEF 2015).

Women in politics make social issues, mainly education and health, a priority, with expenditures quadrupling when women became involved in municipal government (Yanez-Pagans 2008). However, these increases in funding have not shown any significant changes in the health or education status of residents in these communities. Some suggest that the initiatives put in place do not yield short-term results because they are intended to be long-term goals (Yanez-Pagans 2008).

Health

The average life expectancy for Bolivian men is 66.4 years, while women's life expectancy is longer, 72.1 years. This is 10 years shorter than women in the United States can expect to live. Overall, Bolivia's population is young. The two largest demographics by age are those 25–54 (37.08%) and those 14 and younger (32.36%) (CIA 2017).

By 1995, economic growth in Bolivia was still too slow to sustain social well-being. In an attempt to redistribute resources, the Bolivian government appropriated 25 percent of the national income to the municipal level for use in resolving local issues and in support of local populations (CEDAW 1995). Despite this redistribution, Bolivia still provides fewer resources for women and infant health than Costa Rica and Panama, two Latin American countries with similar gross domestic products (GDP) (just more than 61 billion each). For example, Bolivia spends 4.9 percent of its GDP on health, significantly less than Costa Rica at 10.9 percent or Panama at 8.2 percent. Possibly because of this national focus on health, both Costa Rica and Panama have lower maternal mortality rates at birth (40/100,000 and 92/100,000, respectively) and lower infant death during birth (8.7/1,000 and 10.7/1,000, respectively) than Bolivia (CIA 2014a).

Access to Health Care

One factor barring Bolivian women from health care at all stages of life is lack of identity documentation, such as birth certificates or identity cards. In 2001 UNICEF found that 50 percent of births for children 12 months and younger had not been registered (UNICEF 2016). Poor and rural women most often are those without documented legal identity. A lack of legal identity makes these women virtual nonentities, with no access to health services

(CEDAW 2006). Lack of documentation increases the difficulties faced by ethnic groups, who often live in rural communities or on the fringes of urban centers (Harbitz and Tamargo 2009).

Maternal Health

The greatest health risk to women in Bolivia is in reproduction and child care (UNICEF 2015). Most Bolivian women have their first child in their early twenties. The maternal mortality rate of 206 for every 100,000 successful births is high compared to the neighboring countries of Chile (22/100,000) and Peru (68/100,000) (World Bank Group 2015). The mortality rate for infancy death during childbirth is also high for Bolivia, with 39 children dying for every 1,000 live births, compared to 7 children in Chile and 20 in Peru. Bolivia's doctor-to-population ratio is similar to Chile and Peru.

Diseases and Disorders

According to the World Health Organization (WHO), ischemic heart disease is the most common disease in Bolivia, and 7,400 Bolivians died of this disease in 2012. The majority of children under the age of five die from acute respiratory infections (16%) or premature births (15%) (WHO 2015b).

Another health concern is alcoholism. As of 2010, 7.8 percent of Bolivian males had consumed at least 60 grams of pure alcohol on at least one occasion in the past 30 days, while many fewer women had practiced recent heavy episodes of drinking—0.7 percent (WHO 2015a).

Employment

Many scholars have noted the link between social injustice and economic injustice and the fact that these phenomena reinforce and amplify the effects of either injustice. Scholars also agree that ethnicity, gender, age, and other identity labels are political as well as cultural constructs that cannot be separated from an individual's economic reality (Fraser 1995; Harvey 1996; Paulson and Calla 2000). Since 2010, Bolivia's economic growth has been one of the highest in Latin America, and gas exports are providing stability for the larger economy; despite this, "half of all Bolivians live in poverty" (Heritage Foundation 2015).

The difference in wages between nondiscriminated groups and discriminated groups "leads to a smaller

labor force participation from the discriminated people and increases the demand for domestic production on in-home activities" (Canelas and Salazar 2014, 2). The greater the wage differential, the greater the incentive for women within discriminated groups to work at home rather than enter a wage market that is skewed against them. This decision is culturally acceptable, as it places indigenous women in the traditional role of caretaker for the home and children.

In Bolivia, women belonging to a discriminated group can earn wages nearly at parity with the average wage for a woman. This is counter to some research that shows women within discriminated groups have been unwilling or unable to enter the wage market because they find more value in the labor they expend within the home than the wage they could earn and so choose to not participate in the wage labor market. Additionally, barriers prevent Bolivian women in discriminated groups from entering the wage labor market. Because there are fewer women within the job market, wages for all women rise. Bolivia's majority population is indigenous. This has led to men's wages in some ethnic or other discriminated groups being more affected than women's wages within the same ethnic or discriminated group. In this situation, men's wages offer less profit above what they could earn by working at home than a woman's (Canelas and Salazar 2014).

Young children under 7 years of age are mainly the responsibility of women. According to Canelas and Salazar, "men are almost unaffected by the presence of children" (2014, 16). Each additional young child increases the value of women's work within the home and thereby decreases her incentive to work for wages. Regardless of whether a woman works outside the home for wages, on average, a Bolivian woman will spend 40 hours a week on domestic labor. Bolivian men who work for wages will contribute little to domestic labor. In cases where the woman works for wages, indigenous women spent less time working for a wage than nonindigenous women (Canelas and Salazar 2014). On average, nonindigenous women spent three additional hours each week performing wage labor. However, each group contributes the same amount of time to domestic duties.

Education plays a significant role in determining how domestic labor is split between men and women. As education allows women to compete for and hold higher wage jobs, their work outside the home often becomes more valuable than their domestic work; "education increases the bargaining power of women inside the households, which,

in turn, implies that in households where women are more educated, domestic tasks are shared in a more equitable way” (Canelas and Salazar 2014, 16). Education reduces the wage gap between discriminated groups and nondiscriminated groups, “especially for women. In this context, investing in women’s education becomes an effective tool for reducing gender and ethnic inequalities” (Canelas and Salazar 2014).

Family Life

Traditional Andean civilizations are known for their gender complementarity social structure. The Aymara are one such Andean civilization, and their concept of *chachawarmi*, the union of a man and woman, where each contributes essential pieces of a social whole constructed through marriage. Often this is misconstrued as a basis for gender equity (Luykx 2000, 156). It is also through this union that each gender becomes a fully functioning member of the community. Individually, each gender is less than their potential as a spouse. As Rousseau explains, “The notion of individual equality is historically foreign to indigenous cultures that are grounded in community-based principles of justice and harmony” (2011, 22).

It is important to realize that no culture is static and that the Aymara, like all ethnic groups in Bolivia and elsewhere, have changed over time, sometimes radically. Colonialism and globalization are just two factors that continue to affect indigenous cultures. This includes changes to the Aymara understanding and manifestation of traditional concepts such as *chachawarmi*. Bolivia’s increasing urbanization is one of the main factors influencing evolving notions of *chachawarmi*. Migration to urban areas causes “disjuncture” between ideas about gender and daily life among indigenous peoples (Rousseau 2011, 22).

Some contend that machismo is very strong in Bolivia, where women are considered subordinate, restricting their social and work activities (*eDiplomat* 2015). This idea of machismo is a variant to the traditional concept of *chachawarmi*, which finds value only in the work done by women in the home, caring for children and performing subsistence agricultural activities. There is a link between traditional values and violence against women attempting to enter a nontraditional arena such as politics; the most violence against elected women takes place in urban centers with large Aymara and Quechua populations (Butters 2012).

Politics

In 1980, Bolivia signed the Convention on the Elimination of All Forms of Discrimination against Women (CEDAW), which defines discrimination against women and requires national action by party states. In 1990, CEDAW was ratified by Bolivia, making it legally bound to implementing its provisions and to submitting periodic reports to the United Nations (United Nations 2015; CEDAW 2006). Initially, judges and other Bolivian legal professionals were unaware of CEDAW, and this resulted in slow implementation. However, by 1995, the efforts of the Bolivian Office of the Under-Secretary for Gender Affairs to inform legal professionals about the convention and other forms of protection for women had resulted in a growing number of lawyers using the convention, and, by extension, judges beginning to include it in their judgments (CEDAW 1995).

Bolivia made several legislative attempts to place women in government in compliance of CEDAW (CEDAW 2006). The 1997 Quotas Act required proportional representation in the legislature. This was replaced with a new quota in 2004, which required one in every three nominations be for a woman. In both cases, there were no consequences for noncompliance, and both were only somewhat successful. In practice, the 2004 quota led to elections where candidates who were listed as women were in fact men, giving the gloss of gender equality to election results data (UN Women 2013). Bolivia ratified a new constitution in 2009 that includes gender equity changes in terminology; a recognition of the value of work within the home; mandates for an electoral body with gender parity; women’s rights to access, own, and sell land; and women’s rights over their sexual and reproductive health (Gottardo and Rojas 2010). In 2010, an affirmative action policy was instigated that more fully supported the principles of equity and parity within the electoral system; however, problems still exist in providing equal access to the voting process for both sexes and providing remedies for noncompliance (UN Women 2013).

Today, private and public violence against elected women remains a problem. In 2012, town councilor of Ancoraimes and a leading advocate for legislation to protect elected women from harassment as well as physical and sexual violence, Juana Quispe was murdered. At the time of her murder, she was in the process of filing a complaint against two male political leaders. She claimed these men were preventing her from being able to carry

out the duties of her office. Her murder remains unsolved. Unfortunately, she is not the only woman to suffer violence and even death because she wanted a participatory role for women in government. According to the Association of Female Councilors of Bolivia (ACOBOL), female politicians filed more than 4,000 complaints of harassment. They link this culture of violence to ideas of machismo present throughout the country (Butters 2012).

It is clear that many indigenous men and women have very different ideas of what is an appropriate activity for women. Many indigenous women who participate in public service, such as politics, social reform, or education, often will present themselves and their issues as indigenous rather than women's or indigenous women's issues. By refocusing the discussion on the value of indigenous cultures rather than on gender roles, the audience is often more receptive. Luykx believes the main reason for this is that *gender* has become conflated with *modern*, which in turn cannot be separated from perceptions of a social agenda that values only the new. In a country that prides itself on the value of indigenous tradition, modernity is seen as anathema. "This pattern has shown itself time and time again. If analysis of gender relations or critiques of sexual discrimination are viewed as infringing upon the valorization of indigenous culture, they are to be abandoned, or at least minimized" (Luykx 2000, 158).

Some believe that by promoting multiple concepts of gender relations and allowing individuals the freedom to choose how they want to structure their lives, be it around a modern or traditional concepts, Bolivia can find a way past the roadblock of gender equity versus valuing the traditional. Others see Bolivia's linking of "social reforms with neoliberal economics" as a promotion of individual autonomy by providing social reforms that give access to jobs, greater social status, and power to discriminated groups, including women and indigenous peoples, that allow them to make choices between traditional and modern (Paulson and Calla 2000, 116).

Current activists in Bolivia say the harassment continues because of the courts' reluctance to prosecute offenders. The latest legislation meant to protect women lists 15 types of violence against women and increased penalties (BBC 2014). However, the ACOBOL reviewed existing legislation and jurisprudence and found a "legal loophole in this area. Currently there is no specific definition of women's political rights, no legal definition of harassment and gender based violence and no mechanism

through which to report cases of harassment and gender based political violence" (Gottardo and Rojas 2010). The continuing violence, the burden of restrictive agricultural and home duties for rural women, and the greatest incidence of domestic violence of any in South America discourage many women from even attempting to participate in government (BBC 2014). The primary blocks to women's political participation are harassment and violence—issues that, unfortunately, neither the government nor the public acknowledges for discusses (Gottardo and Rojas 2010).

Despite continued assaults, Bolivian women are still putting themselves in the middle of politics, and the number of women in government continues to slowly increase. "In a ground breaking historical event, 47 percent of those elected to the Senate last December were women, 25 percent in the Chamber of Deputies and 30 percent in the Plurinational Legislative Assembly. And earlier this month Dr. Ana Maria Encina, ACOBOL's President, became the mayor of Santa Cruz, the second largest city in Bolivia, and the largest in terms of economic power" (Gottardo and Rojas 2010). President Morales's cabinet includes women in several key positions: minister of autonomy, Claudia Stacy Pena Claros; minister of communication, Amanda Davila Torrez; minister of justice, Sandra Elizabeth Gutierrez Salazar; minister of planning and development, Elba Viviana Caro Hinojosa; minister of productive development and pluralist economics, Ana Teresa Morales Olivera; and minister of rural development and lands, Nemecia Achacollo Tola. The six positions held by women in Morales's 2014 cabinet do not come close to parity, even at this level of government (CIA 2014b).

Religious and Cultural Roles

Although an ethnically diverse country, Bolivia is 95 percent Roman Catholic (CIA 2014a). In the late 20th century, the Catholic Church took a more active role in Bolivian social issues. Despite this, the number of Protestant members has been growing since the late 20th century, and both Mormon and Baha'i religions have begun to find a home in Bolivia in the 21st century. Some indigenous religious activities and beliefs are still practiced, especially worship of the earth goddess Pachamama. The Catholic Church has attempted to assimilate indigenous religious beliefs and activities, with varying degrees of success (*eDiplomat* 2015).

Issues

Andean culture groups, such as the Quechua and Aymara, are reacting to the concepts of *gender* and *indigenous* as polarizing terms that have been defined and imposed on them by people or organizations outside of themselves (Paulson and Calla 2000). Adding to the pressures creating the divide between gender and indigenous is the funding currently being used for gender issues among Andean people. Many indigenous people believe the funding and resources provided by nongovernmental organizations (NGOs) and governmental agencies should be used for indigenous issues as a whole, rather than one segment of the culture. One example of the collision between gender and indigenous needs is found in the bilingual-intercultural education (BIE) program, which is often funded by nonindigenous NGOs or government agencies. A fundamental principle of BIE is respect for the beliefs and cultural practices of discriminated groups. These entities, along with funding and access to education, bring their culturally defined and deeply rooted ideas of what constitutes gender equality. As a condition of funding for financial and technical assistance for BIE programs, NGOs and government agencies will ask for a commitment to “gender equity,” which the indigenous people see as “a manifestation of cultural imperialism” (Luykx 2000, 153).

Today in Bolivia, gender discrimination, sometimes leading to violence inside or outside the home, is present in urban and rural settings among indigenous and non-indigenous peoples. According to CEDAW (2006), over 53 percent of women had suffered physical violence at the hands of their spouse, as compared to 27 percent of men, which is the highest rate of 12 Latin American countries. Machismo, an acceptance of aggressive behavior, and financial insecurity also contribute to intimate partner abuse. Society’s attitudes about such violence is changing in part due to press coverage and in part due to passage of Law 348, designed to protect victims and punish perpetrators (Shahriari 2015).

Brazil

Overview of Country

Located in northeastern South America and facing the Atlantic Ocean, Brazil is the largest country in Latin America, with an area covering almost 3.3 million square miles. It borders all South American countries except Chile and Ecuador. It is the third-largest country in the Americas and the fifth-largest country in the world (CIA 2014). It is the largest Portuguese-speaking country in the world and the only one in the Americas.

Numerous indigenous groups with different languages and traditions thrived in the area before the Portuguese explorer Pedro Álvares Cabral landed in Brazil in 1500. Rio de Janeiro became the capital of the Portuguese Empire in 1808, and during that same year, the government opened its ports to all nations, which enabled direct commercial interaction and resulted in an unprecedented accumulation of wealth. Brazil became independent from Portugal in 1822 and established a constitutional monarchy and a parliamentary system. The military formed a republic in 1889, after the abolition of slavery in 1888. The populist president Getúlio Vargas rose to power in 1930 in response to the domination of large landowners and coffee growers. After an authoritative military regime led the country from 1964 to 1985, Brazil returned to civilian rulers. The federation is composed of the Federal District of Brasília, the capital; 26 states; and 5,564 municipalities.

The federal constitution of 1988, last amended in 2012, departed from authoritarianism and moved toward democracy. This constitution decreed the separation of the executive, legislative, and judiciary powers and created legal norms and parameters to institutionalize human rights, including the recognition of women's rights. It is

the first constitution in Brazilian history that starts with individual rights and constitutional guarantees of citizens before articulating the issues of the state. The current Brazilian legal system is based on the Civil Code enacted in 2012.

According to the World Bank, Brazil's gross domestic product (GDP) was USD\$2,246 trillion in 2013, making it the world's seventh-largest economy. It surpasses the sum of all other South American countries. In the last few years, the economy grew at a fast pace due to the discovery of large oil reserves, growth in commodity demands, and the building up of foreign reserves. Brazil's international recognition also grew, as shown by the increase in external investment to 26 percent, or approximately USD\$48 billion, in the last five years. Brazil is a founding member of the United Nations, the G20, the Community of Portuguese Speaking Countries, and other inter-American and Latin American organizations. It has been the world's largest producer of coffee for the last 150 years (World Bank 2014).

Government initiatives in the last decade have focused on reducing inequality within the nation. The population living below the poverty line is at 21.4 percent, and extreme poverty is at 4.2 percent (CIA 2014). The program Brazil without Poverty expands support to its low-income and poor population, especially women, providing them with family assistance. This program reaches out to 16 million people, offering capacity-building opportunities, microcredit, and extension programs in rural areas. These programs are intended to improve access to services and to develop human capital. However, poverty remains high, especially in the northeast, north and center-west. Opportunities in these regions are scarce, forcing residents to relocate near urban areas. As a result, illegal settlements and *favelas* (slums) in cities continue to grow. The urban population in Brazil is at 84.4 percent, while the rural population is at 15.6 percent (IBGE 2010).

According to the 2010 Census, the total population of Brazil is 190,755,799, making it the most populated country in South America. The population ratio between men and women is 49 percent men and 51 percent women (IBGE Censo 2010).

The age structure of the population reveals that the majority are between the ages of 10 and 29. The population under age 4 has declined due to successful family planning that lowered birth rates. In 1991, the population under age 4 was 5.7 percent for boys and 5.5 percent for girls, and in 2010, it declined to 3.7 percent for boys and 3.6 percent

for girls. Another notable change in demographics is the increase of the population of those age 65 and older. From 4.8 percent in 1991, it increased to 7.4 percent in 2010. This scenario suggests a future with a shrinking labor force and an increased share of the elderly population (IBGE Sinopse do Censo Demográfico 2010).

According to the 2010 Census, 47.7 percent of Brazilians consider themselves white, 43.1 percent multiracial, 7.6 percent black, 1.1 percent Asian, and 0.47 percent indigenous. Multiracial is a broad category that includes permutations among indigenous and whites, Afro-Brazilians and whites, and indigenous and Afro-Brazilians. Although whites represent the largest group, the sum of blacks and multiracials, considered by many scholars as one category, is over 50 percent, making Brazil one of the countries in the world with the largest presence of people of African ancestry (IBGE Sinopse do Censo Demográfico 2010).

The centuries between the first Portuguese arrival and the mid-19th century witnessed a large arrival of Africans with different ethnicities, languages, and traditions. They were the solution for labor shortages caused by the decimation of the native Amerindians. Nearly 45 percent of all the Africans who were part of the Atlantic slave trade were forced to settle in Brazil (Lesser 2013, 11). They labored on sugar plantations, in mines, and in urban areas until slavery was abolished in 1888. Freed Africans and their descendants have always maintained contact with immigrants and indigenous people as they settled in communities in the forests and hinterlands. This intermingling has played an important role in national identity formation.

Black and indigenous women often worked directly in the homes of slave owners and their families during the colonial period and through the 1800s. After the abolition of slavery in 1888 and in early 1900s, sexual exploitation of black women increased and was accompanied by a stereotype that associated blackness with promiscuity. This period coincided with the country's leaders' sweeping efforts at nation-building and behavioral "whitening" conducted through education, public health, and hygiene campaigns (Dávila 2003, 24).

Indigenous people were the first victims of slave labor and sexual exploits by Portuguese explorers and merchants. For many centuries, indigenous women were subjected to illicit sexual relationships and were victims of increased cultural exclusion, invisibility, and loss of their ancestral lands. These conditions generated domestic violence and increased sexual exploitation in the form of trafficking and child prostitution. Black, multiracial, and indigenous

women continue to be less visible and are less represented in the rural and urban labor force, and they continue to have limited access to health care and education.

As in other countries in the Americas, Brazil is a nation of immigrants. Arriving either involuntarily or voluntarily, more than 5 million immigrants from more than 60 countries settled there between 1870 and 1972 (Lesser 2013, 14). They interacted with indigenous, mixed-race, and Portuguese descendants, creating a unique culture and home in their new country.

Although “volunteer immigrants” in the late 1800s and early 1900s came from Europe—most of them Portuguese, Italian, Spanish, German, Polish, and Russian—immigrants also came from Japan, the Middle East, and to a lesser extent China. Many immigrants from Eastern Europe had seen their national origins shift, from Germany to Poland, for example, reflecting regional conflicts and new national borders. The same is true of immigrants from the Middle East, where many Christians left contemporary Syria and Lebanon to settle in major cities such as São Paulo. A large percentage of Jews who left Europe due to discrimination also settled in Brazil, especially in the south.

Japanese immigrants, the largest group from Asia, worked mostly as laborers in coffee plantations in the southeast. In addition to existing black and mixed-race populations, their presence caused concerns among the nation’s elite who idealized the nation’s whiteness and European ways and considered nonwhites a threat to an ascendant national racial identity. Today, the Japanese community, with more than 1.2 million people residing in the São Paulo and Paraná states, is the largest Japanese diasporic community in the world. In the 1980s, due to economic decline and hardship, a substantial number of Japanese-Brazilians immigrated to Japan to work in various industries. Other Brazilians also left to work in the United States and Western European countries. These numbers were never significant, and as the economy has grown in recent years, fewer seek employment overseas.

Over the years, the classic bossa nova song “The Girl from Ipanema” has romanticized a glamorous, albeit superficial, image of Brazilian women around the world. Contradicting this image, Brazil’s 500 years of history, filled with women of all racial, ethnic, class, economic, and gender backgrounds operating within the context of the powerful Catholic Church and Portuguese-Brazilian patriarchal traditions, has forged a complex female identity. This identity is one defined by the constant struggle to

assert the role of women in Brazilian society and build a more equitable society.

The UN Development Programme (UNDP) ranks Brazil 92th out of 188 nations based on the Gender Inequality Index (GII, 0.414). Compared to its neighbors, Chile and Argentina, Brazil scores lower in the “Share of Seats in Parliament” category, has a higher adolescent birth rate, and scores lower in the “Women Twenty-Five+ with at Least Some Secondary Education” category. In maternal mortality, Brazil ranks lower than Chile, but higher than Argentina (UNDP 2015).

Girls and Teens

From the 16th century throughout the 19th century, education was reserved only for the elite, and most remained illiterate. Progress in public education occurred slowly and almost exclusively in urban centers such as Rio de Janeiro, the center of all activities, where the royal court added prestige to social life. In wealthy families who adopted the new styles of life, girls were trained in social norms of the time and acquired many qualities in finishing schools, where they stayed until the age of 12 or 13, when they left to get married.

After legislation on public primary education passed in 1827, girls in cities enrolled in public schools and gained access to the same education as boys, except for geometry, which was replaced by home economics. While boys learned mathematical abstraction, girls learned domestic tasks, delineating clear gender roles. In elementary schools in indigenous villages, where teachers attempted to ban the native language and teach civility, girls learned the Christian doctrine, reading, writing, spinning, lace making, sewing, and other activities considered appropriate for women. The law allowed girls aged 10 and under to attend classes for boys in Indian villages, where it was not possible to have single-sex classrooms (Vidal and Faria Filho 2008, 57).

The 1827 Education Law also enabled women to be hired as teachers, and in 1835, the first normal schools for teacher training were established. As women started to be admitted, normal schools became an option for women seeking a profession. Around 1860, the first commercial schools were created. The Liceu de Artes e Ofícios Imperial, a postsecondary school for teaching of arts and crafts in Rio, opened its doors to women in 1881. Literacy rates among all Brazilians remained very low, although in urban centers, the number of literate men and women was higher. In 1870, only 20 percent of Brazil’s 10 million people were

literate, with literacy more common among men than women. In 1872 Rio de Janeiro, 50 percent of males and only 30 percent of females could read. It is no surprise that the literacy rate was higher among upper-class women.

Toward the end of the 19th century, private secondary schools for women were created in different parts of the country. Among schools sponsored by religious denominations, most of them were Catholic, but some were Protestant, such as the American School (later Colégio Mackenzie) created in 1870 by Mary and George Chamberlain, Presbyterian missionaries in São Paulo, and the Colégio Piracicabano, created in 1881 in Piracicaba, São Paulo, with the support of the American Methodist Church (Colégio Presbiteriano Mackenzie 2015; Colégio Piracicabano 2010).

20th Century

In the 1920s, Brazilian leaders became interested in education as a nation-building tool, and between 1932 and 1939, many new schools were added to the 27,000 existing ones. The number of teachers of all levels increased, and the national student body expanded. By 1940, the school system had become a major employment source for women. The expansion of public elementary schools increased all women's literacy, especially lower-class women. The leading educational reformers saw the importance of teachers' training as key to education reform. Rio's public normal school became the Instituto de Educação, which was modeled after the Columbia University Teachers College in New York.

The admission to the Instituto de Educação was very selective and narrowed the candidates academically and in other ways. The entrance exam was rigorous and required an additional private preparatory course, placing admission out of the majority of the population's reach. Also, the first stage of admissions was an eliminatory "health exam" that was successful in selecting and promoting a white, professional, middle-class public identity for teachers that aligned with the national ideology of nation-building.

The most prestigious public secondary school in Rio was the Colégio Pedro II founded in 1837 to educate the nation's nobility and serve as a recruiting ground for the elite bureaucracy. As with the Institute of Education, admission to the Colégio Pedro II was very selective, with a rigorous entrance examination. In the 1920s, it began enrolling women and catered to students from modest backgrounds to compensate for the exodus of elite children

to a growing number of private secondary schools. In 1930, 14 percent of the day school students were women. By 1934, this increased to 25 percent, where it remained throughout the 1940s. Most likely, these women were the ones who passed entrance examinations when institutions of higher education opened their doors to them in 1879. While women continued to be a minority in the student body, the classrooms were integrated, and all students were taught the same curriculum, except for separate physical education classes (Dávila 2003, 205).

Education

Vocational Education

As industrialization advanced in urban areas, the dominant sector, textile manufacturing, employed a large number of women and girls. While this labor was essential, it had an image problem, as it could be seen as an erosion of family values that tied women to home. While women and girls working in factories were unskilled and needed vocational training, the industrialists could be charged with encouraging women to abandon their homes and children for work. Thus, political leaders and industrialists created vocational schools that offered a variety of programs directed at working-class women for their training while simultaneously reinforcing traditional gender norms (Weinstein 2006, 73).

The first major attempt at vocational schools was intended to make professional education more attractive to urban youth from lower-class families. In São Paulo, the state sponsored both an Escola Profissional Masculina and an Escola Profissional Feminina, legitimizing the importance of female labor in the growing manufacturing industry. In these schools, in contrast to the courses on metallurgy and mechanical trades offered to men that led to higher wages, the courses for women were geared toward learning dressmaking, sewing, lace and embroidery making, cooking, hygiene, and nutrition from society ladies. In reality, this approach offered limited skills training and only emphasized women's roles in domestic and family matters.

In the 1930s, the focus on vocational education continued and was expanded nationally. By the early 1940s, educators and industrialists had created a vocational training system known as the SENAI, the National Service for Industrial Training. Funded and controlled by the industrial associations, the schools took a pragmatic approach and offered requirements for specific industrial

Women's Voices

Myrthes de Luca Wenzel

Myrthes de Luca Wenzel (1917–2004) was a pioneer educator who established and served as principal of the Fundação Centro Educacional de Niterói, an experimental secondary school with an innovative curriculum. For Wenzel, education was a tool for empowerment and ability building. She encouraged creativity and critical thinking and taught students to aspire for a world with more harmony and respect. Unlike the majority of Brazilian schools, Wenzel's school offered activities such as chorus and team sports.

Wenzel was appointed secretary of education and culture of the State of Rio de Janeiro from 1975 to 1979. Her broad vision of education inspired many generations of educators in Brazil.

—Kayo Denda

sectors, and they did not exclude women in industrial education. However SENAI's focus on apprenticeship programs for metallurgical trades and courses for training textile factory supervisors were not available for women. After World War II, the industrialists also created SESI, the Industrial Social Service, with a broader mission than SENAI. It was intended to be a vehicle to "improve workers standard of living, hygiene, and culture through rational forms of assistance, guidance, recreation, and instruction" (84). SESI served as a powerful vehicle to institutionalize and disseminate the gendered differences and traditional roles of women to the working-class population.

21st Century

In the last decades of the 20th century, progress in cultural and social values and demographic transformation altered women's roles toward more public and economically active roles. Primary education became more accessible, and 95 percent of girls now attend primary schools (UNICEF 2013). Women also gained access to higher education, resulting in higher wage-earning and professional opportunities.

Women's enrollment at university has been particularly notable in recent years. In 2009, 59 percent of all

undergraduate students were women, although most of them majored in traditionally "feminine" fields, such as education, nursing, social work, and liberal arts. In terms of years of education received, in 2010, women supplanted men with an average of 7.4 years, compared to 7 years for men. In the active labor force with more than 15 years of education, 13 percent are women compared to 8.2 percent men. This is an empowering scenario given the pervasive oppression of the Catholic Church and the persistence of a patriarchal tradition that reinforced traditional gender roles. However, these gains are still uneven among different groups. In 2009, the illiteracy rate among women aged 15 and older was 6.42 percent for whites, 13.97 for blacks, 13.12 percent for mixed race, and 12.81 percent for the indigenous, demonstrating the continuing difficulty of access to education for black, mixed-race, and indigenous women (Bruschini et al. 2011, 145).

Health

Access to Health Care

The 1988 Constitution introduced human rights parameters into the law that guarantee women's autonomy regarding health, sexual freedom, and reproductive rights. The framework also guarantees citizens full access to all services necessary to preserve bodily integrity, reproductive freedom, and sexual well-being, in addition to creating conditions and services available to all citizens, regardless of their gender.

During the nation's democratization that started in 1985, significant progress was achieved in the area of health care. The government established the Sistema Único de Saúde (SUS), or Unified Health System, which now provides universal health care for more than 75 percent of the population (Portal Brasil n.d.). The SUS is based on the concept of decentralization, and part of the responsibility for the management and financing falls to the state and municipal governments. Its implementation has been slow, marked by political and economic upheavals. Its effectiveness depends largely on the budget allocation above the mandatory allocation each state and municipality can dedicate (which are 12% and 15% for state and municipality, respectively). It is not surprising that the SUS in wealthy municipalities offers extraordinary services compared to municipalities with modest budgets. Nonetheless, the SUS is one of the most significant units in the campaign for sexual rights and reproductive justice issues for all Brazilians, and since 1997, it has provided medical

care for legal abortions, gender violence, HIV prevention, emergency contraception, and psychological counseling.

Primary health care is given at the point of service through the Family Health Program, which offers a wide range of hospital services, including heart surgery, imaging services, cancer treatment, and laboratory diagnostics. It also supports a comprehensive vaccination program, prevention campaigns, and basic dental care, and it covers 90 percent of many prescription medications, including treatments for HIV/AIDS, hepatitis, and other infectious diseases.

Maternal Health

The maternal mortality rate (MMR) provides one measure of women's health, and as of 2009, all Brazilian states by law investigate the deaths of women of reproductive age, an uncommon practice in rural areas. In 2008, one measure found a MMR of 55 deaths per 100,000 live births, which is within a stable range over the previous decade. Examples of the primary causes of maternal death included hypertensive disorders at 23 percent, sepsis at 10 percent, hemorrhage at 8 percent, and other indirect causes at 17 percent (Victora et al. 2011, 1863–1876).

Abortion

The struggle over abortion continues to be one of the main issues for women's rights activists. Thus far, the campaign to alter Brazilian criminal law and amplify the boundaries of legal abortion have been unsuccessful. Abortion, either self-inflicted or by a third party, continues to be a crime under the 1940 Penal Code, resulting in sentences of 3 to 10 years in prison. Two exceptions are for cases to save the mother's life and for pregnancies resulting from rape. One area pro-abortion activists advocate is to allow legal pregnancy termination in cases of a fetus with anencephaly, a condition that can be diagnosed during pregnancy. But women currently have to carry these pregnancies to term, despite the health risks and the fact that the majority of babies will die shortly after birth.

The restrictive legislation compels women who choose abortion to seek unsafe and clandestine methods. Elevated numbers of these illegal abortions continue to be the cause of death for many women. The report *Aborto Inseguro* (Unsafe Abortion) reveals significant regional differences. The states of Bahia, Rio de Janeiro, Roraima, and Sergipe and the Federal District are responsible for more than 10 percent of abortion-related hospitalizations, and in the

states of Maranhão, Paraíba, and Tocantins, the numbers are below 4 percent. The lower percentage in these states might be related to the lack of hospital resources available and not necessarily a reduced number of abortions. The difficulty of abortion-related data is directly related to its illegal status, a condition that needs to be rectified (Ventura 2011, 313).

According to the Ministry of Health, the number of abortions authorized by law and conducted by the SUS diminished by 42 percent between 2008 and 2009. The ministry attributes this drop to effective distribution of contraceptives, especially the morning-after pill. However, women's organizations are more cautious, considering that around the nation the government established only 60 hospitals to provide abortion services.

Diseases and Disorders

The most numerous causes of death for women are cardiovascular diseases, breast cancer, and respiratory problems (Pitanguy and Barsted 2011, 368). Some data show that deaths due to vaccine-preventable diseases and HIV/AIDS are under control (Victora et al. 2011, 1863–1876).

Employment

Brazilian women constitute more than 43 percent of the economically active population. A significant characteristic of women in the labor force today is their family and marital status. Until 1980, the majority of working women were young, single, and with no children. In recent decades, the most significant group of working women is older, married, and with children. In 2009, 75 percent of women between 30 and 39 years old and 71 percent of women between 40 and 49 years old were employed. Unlike their mothers and grandmothers, women today remain employed during their reproductive years and juggle the responsibilities of motherhood and work (Bruschini et al. 2011, 148).

19th Century

Throughout the 19th century, most upper- and middle-class women continued to perform their roles as mothers and wives, but a few privileged women, who were educated, translated European books, published poetry, and wrote for newspapers and magazines. By the end of the 19th century, thanks to the expansion of the public school system, women with modest origins had become

teachers and held other jobs. A few women also became lawyers, dentists, and medical doctors.

The majority of lower-class women, slave and free, worked as seamstresses, hairdressers, midwives, laundresses, artisans, wet nurses, small merchants, midwives, hairdressers, shopkeepers, factory workers, and rural laborers (Costa 2000, 256). Many poor women owned small farms or squatted on vacant land in the cities or tenement houses, enjoying a certain degree of freedom. They washed clothes in the rivers, went door-to-door selling fruits and vegetables, set up stalls in the streets, or opened small stores. However, as the city prospered from expanded industrialization and business activities, these women lost their jobs due to the privatization of public spaces, competition from established merchants, and new regulations, such as taxes, imposed by the state. These interventions brought order, discipline, and, in many instances, public health measures to prevent epidemics of cholera, smallpox, and malaria. Some of the women who survived these urban transformations started working in factories, particularly in textile factories. The bulk of the poor women, however, continued to work as maids.

Despite a limited readership, a small number of women found jobs in the country's growing newspapers and magazines, especially with those devoted to women. Most of these publications were from wealthy states, such as Rio de Janeiro, São Paulo, Pernambuco, Bahia, and Rio Grande do Sul. These publications included news and essays about fashion, literature, arts, theater criticism, and advice to women. In the second half of the 19th century, they included articles on women's education and access to legal, medical, and pharmaceutical professions. Later, they became vocal on social issues and addressed male discrimination against women, slave emancipation, and suffrage and disseminated women's accomplishments around the world.

The most famous Brazilian woman writer in the first half of the 19th century was Nísia Floresta (1810–1885), who was originally from the state of Rio Grande do Norte. In 1832, she translated for the first time into Portuguese the *Vindication of the Rights of Women* by Mary Wollstonecraft. She eventually moved to Rio and founded the Colégio Augusto for girls. An abolitionist and republican, Floresta advocated for women's equal education. Another notable figure from that time is Maria Firmina dos Reis (1825–1917), from the state of Maranhão. She was black and born as an illegitimate child. She became a teacher and abolitionist. She translated several books from French

to Portuguese and wrote books and short stories, among them was the essay “*A escrava*” (The Slave Woman) (Schumacher and Brazil 2000, 390, 451).

There was a vast distance between the lives of middle- and upper-class women and the lives of the poor, and it was very difficult to talk about women in a general category, as their issues and realities varied significantly. However, all women had common ground in terms of struggle. They confronted multiple pregnancies, abortions, and risked death at childbirth. They were also discriminated against by church and society and were victims of male prejudice and violence. Aside from gender discrimination, poor black, mixed-race, and indigenous women suffered from class and racial discrimination.

Trade Unions and Women

In the 1890s, immigrant groups and the growing number of factory workers created mutual aid societies that provided their members social and medical assistance, instruction, and recreation. They also founded trade unions to defend their interests, and some tried to incorporate women into their organization. The Workers Party of Rio Grande do Sul supported socialism and published in local newspapers the importance of women's emancipation and claims that women should enjoy all rights and political liberties (Costa 2000, 260).

The socialists were the first political group to include women's rights in their platform. The Brazilian Worker's Party declared itself socialist, and the party committed itself to, among other things, guaranteeing all civil and political rights to women. The Social Democratic Party, from São Paulo, went further. In its 1896 program, using its inflammatory rhetoric, it called for universal suffrage, the abolition of all kinds of privileges, free public schools, and mandatory schooling for all, including women.

Early Feminists

Women's autonomy and equal rights were also addressed in liberal newspapers and magazines such as *A Mensageira*, published by Prescilliania Duarte de Almeida (1867–1944) in São Paulo, from 1897 to 1900. Although its explicit goal was literary, it included articles by outspoken women activists defending women's education and access to professions as well as information on women's movements around the world (Schumacher and Brazil 2000, 468).

Despite inconsistencies, lack of interest or knowledge of the predicament of subaltern women, essayists had

become increasingly aware of the inequalities between men and women and the need to educate and prepare women to have a profession. In the final decades of the 19th century, early feminists allied with their male counterparts, republicans, abolitionists, and those who struggled for the separation of church and state and supported the 1889 proclamation of the republic. Though universal suffrage was adopted, it excluded women. Women finally gained their voting rights in 1932.

20th Century

In the 20th century, women continued to enter the labor force. Between 2002 and 2009, women's participation grew from 36.5 million to 44.4 million, a rate change from 42.5 percent to 44 percent (Bruschini et al. 2011, 149). In addition to President Dilma Rousseff (1947–), examples of accomplished women leaders include Ellen Gracie Northfleet (1948–), the first woman to join the Federal Supreme Court and who served as the chief justice from 2006 to 2008; Graça Foster (1953–), who was appointed in 2012 as the first woman to head Petrobrás, the Brazilian national oil company and the largest oil company in South America; and Marina Silva (1958–), an environmental activist and a member of a poor rubber-tapping family in the Amazon, who ably filled the post of the minister of environment from 2003 to 2008. In 2014, Silva was a presidential candidate and finished third after the first round of the presidential election. Dilma Rousseff was reelected by an extremely slim margin in a run-off election against a centrist candidate endorsed by Silva.

Women in the Labor Force

The professional careers where women are most numerous are medicine (41%), private law (49.9%), public law (46.8%), magistrate (36.6%), federal employment (40.8%), and engineering (15%). Many professional women have achieved positions of leadership, but a glass ceiling often denies their access to senior corporate or administrative positions. Although the percentage of women in leadership positions has increased from 16.2 percent in 2004 to 21.9 percent in 2009, male-female income disparity is still prevalent, especially for higher-paying jobs (Bruschini et al. 2011, 165). In their rise up the corporate ladder, women continue to face inequality and a pay gap based on gender.

The labor force participation rate varies according to race and ethnicity as well as by state and region. Among

women in the wage-earning labor force, 57 percent are white, and 43 percent are black and multiracial women. Black women workers continue to be the most discriminated against labor force category and have fewer opportunities. White women are better represented in more prestigious jobs and in occupations with better salary and benefits (Bruschini et al. 2011, 150).

Despite an improved economy and increased job opportunities, many things remain the same. Women are usually responsible for all household work, child care, and the care of other family members, a substantial load above the job itself. Child care continues to be one of the major difficulties for all women in the labor force. The workforce participation rate of mothers with children age 2 and younger was 57 percent, compared to those with children ages 7–14, or school-age children, at 74 percent, illustrating the challenges mothers of younger children face to participate in the workforce (Bruschini et al. 2011, 151).

Domestic Workers

Although general labor conditions for women have improved over the years, 17 percent, or approximately 6,700,000 women, worked as domestic workers in 2009, despite a slight decrease from 17.4 percent in 2002. The number of women domestic workers differs according to age groups. The number of younger women, aged 29 and under, has dropped; yet, the number of women over the age of 30 has increased. This could be related to educational opportunities that younger women have access to, resulting in more attractive choices of employment. An occupation known for low income, 96 percent of domestic workers receive a monthly salary lower than the value of two minimum salaries, as established by each state. The 2006 legislation states that domestic workers have the right to receive 30 days of vacation a year and child-birth-related health benefits; unfortunately, in practice, not all workers receive these benefits (Melo e Sabbato 2011, 179).

Rural Women

The Gender, Racial, and Ethnic Equality Program is a unit within the Special Secretariat of Policies for Women responsible for addressing issues faced by rural women. The category of *rural women* is broad and consists of small farmers, foragers, artisans, indigenous women, and *quilombolas*, Afro-descendants of former runaway slaves who live in forests and hinterlands. The

1988 Constitution gave special guarantees of land title to the *quilombola* population residing throughout the countryside.

Despite the diversity of activities and background among rural women, some common issues unite them. These issues include rights to land and the proper documentation of assets, access to credit previously only accessible to men, a need for technical assistance for farming and other activities, violence against women, and a lack of infrastructure, such as water. Access to water is one of the main problems for all rural Brazilians. The national average of households without drinking water is 2.6 percent in urban areas and 31 percent in rural areas. The situation is worse in the northeast, an area known for heat and dry weather, where 49 percent of households in those rural areas lack drinking water. Women in these households are tasked with the responsibility to fetch water, giving them an extra burden in addition to other household work (Cintrão 2011, 192).

Another issue that galvanizes rural women is agrarian reform, or the right to land and proper documentation. For married women, having their names documented in the title of the land and property is vital to prevent potential transactions by husbands without their consent. In 2011, rural women and advocacy groups organized a march for justice, autonomy, and equality for all rural women that attracted more than 70,000 participants to Brasília (Pitanguy and Barsted 2011, 379).

Family Life

Birth Rate and Family Structure

In the last decades, family size has decreased as women have fewer children as a result of successful family planning, especially the availability of contraceptives. In recent years, married women's use of contraceptives has ranged from 51 percent to 75 percent, the same as in the United States, Canada, and countries in Western Europe. More recently, the birth rate for women residing in urban areas in the south and southeast regions dropped to 1.94 per woman. The reduction of the average family size to 3.1 people and a longer life span for women compared to men, ages 77 and 69.4 years old, respectively, has resulted in a larger presence of women among the older population (Bruschini et al. 2011, 144).

Although the most prevalent household model still consists of a heterosexual married couple with children, with men as the heads of the household, this model has

decreased from 53 percent in 2002 to 50 percent in 2009 (Censo 2010). In contrast, there has been a significant increase in households with married women as the head of the household. This type of household grew from 0.8 in 1992 to 9.4 percent in 2009. The changes in the Civil Code in 2002 that recognize men and women with the same legal and economic rights and authority for family decisions have supported this growth. Another significant phenomenon in the last few years is the proliferation of households led by single women. More and more women find themselves as the only adult in the household with or without dependents. (145).

Child Care

In recent years, child care has been defined within the framework of children's rights. This framework states that every child has the right to receive education, and child care constitutes its first step. In reality, the minimum age for public day care admission is four, forcing mothers and caretakers to make child care arrangements before the child reaches this age. This directly impacts women as they contemplate entering the job market. Even after children are enrolled in day care centers, the hours of operation are frequently inadequate. In São Paulo, the majority of day care center hours are 7:00 a.m. to 4:00 p.m., forcing mothers and caretakers with full-time work and long commutes to make alternative child care arrangements to match their needs. This situation is in stark contrast with Brazil's Constitution that declares "all workers have rights to free childcare for children from birth to age six" (Constitution of the Federative Republic of Brazil 1988, 143).

Politics

In 2010, Dilma Rousseff was elected as the first woman president, and in 2014, she was reelected for a second term. The daughter of a Bulgarian immigrant, Rousseff joined student-activist groups against the military regime when she was in high school and was captured and jailed from 1970 to 1972, where she was allegedly tortured. After her release, she moved to Porto Alegre in the south to rebuild her life and her political career. With her then husband Carlos Araújo, she established the Democratic Labor Party, but she eventually joined the Workers Party. Before her successful election to the presidency in 2010, Rousseff served as the minister of energy from 2003 to 2005 and chief of staff from 2005 to 2010, under the administration

of President Luís Inacio Lula da Silva (Palácio do Planalto Presidência da República n.d.).

After she became president in 2010, Rousseff nominated nine women to cabinet-level positions and firmly endorsed women's and gender issues, including economic empowerment and prevention of gender-based violence (Pitanguy and Barsted 2011, 15). However, efforts to increase women's political participation at all levels started years before. One example is the Quota Law enacted in 1997 that established minimum (30%) and maximum (70%) quotas for the number of candidates of each gender from each political party at elections. The law also defines each political party's obligation to reserve 5 percent of its budget to create and maintain programs that promote women's political participation (Araújo 2011, 96). Unfortunately, the percentage of Brazilian female politicians at all levels is still one of the lowest in Latin America. President Rousseff has the opportunity to assert her priorities on gender equality during her second term.

Status of Women

Brazil signed and ratified two international treaties and conventions that define discrimination against women and create a national agenda for its elimination: the Convention on the Elimination of All Forms of Discrimination against Women (CEDAW) and the Convenção de Belém do Pará, the Inter-American Convention to Prevent, Punish, and Eliminate Violence against Women.

In 2002, the Brazilian legislature enacted sweeping changes to its Civil Code, granting equal rights to all citizens, regardless of their race, ethnicity, and gender. These extensive changes, created in the process of the nation's democratization, included clauses addressing human rights and the recognition of women's rights. With the new Civil Code, women gained a voice and authority in decisions regarding marriage and divorce, children, ownership of property, and a wide range of matters that were previously entrusted only to men. Also in 2002, the executive office created the Special Secretariat of Policies for Women with the status of a ministry. In 2006, the Brazilian government enacted a law under the symbolic name of the Maria da Penha Law. The law criminalizes domestic violence and enacts women's rights and constitutional protection against violence. Despite these landmarks and the tireless work of women's activists and social justice organizations, the majority of women, especially low-income black, multiracial, indigenous, and rural

women, continue to experience social discrimination and violence.

Women's Rights

In 1932, Brazil granted women the right to vote. This was the result of women's activism that started in the mid-19th century. The leader of this movement was the biologist and lawyer Bertha Lutz (1894–1976), who founded the Brazilian Federation for the Advancement of Women affiliated with the International Women's Suffrage Alliance in 1922. The Brazilian suffrage movement, made up of professional and educated women, represented a very small percentage of women. The campaign was a movement of the elite and was led by socially and politically well-connected women, such as Olívia Guedes Penteado (1872–1934), a prominent figure in São Paulo. She worked tirelessly in campaigning for Carlota Pereira de Queiroz (1892–1982), an educator and physician, who became the first woman elected to Congress for the São Paulo state (Weinstein 2006, 28; Schumacher and Brazil 2000, 129, 457).

Before the 1988 Constitution, Brazilian legislation privileged men over women in family decisions such as inheritance and succession matters. The Civil Code enacted in 2002 created legal norms for public and private rights for all citizens. However, despite the law, institutions to

CEPIA

CEPIA is a nongovernmental organization (NGO) dedicated to women's advocacy in Brazil. The acronym stands for *cidadania, estudo, pesquisa, informação, and ação*—citizenship, study, research, information, and action. Using human rights framework to advance women's rights, CEPIA focuses on issues of women's health, gender violence, elimination of poverty, and empowerment of women.

Under the leadership of Jacqueline Pitanguy—an internationally known feminist activist, scholar and author—CEPIA conducts research and monitors public policies on women's issues. It organizes meetings, seminars, and conferences to engage feminists, scholars, activists, government leaders, and union representatives to advance women's and gender issues in Brazil.

—Kayo Denda

enforce and implement gender equality and land reform have not yet been firmly established. Thus, inequalities persist in practice, forcing various spheres of government to establish strategies to rectify the situation. The integration of gender into the public political arena is recent and has been shaped by the demands articulated by Brazilian women, international women's activist organizations, and debates and resolutions of international women's conferences.

According to the Special Secretariat of Policies for Women, all 26 states of the federation have a state-level office dedicated to women's issues, and many administrative and political units working toward gender equality exist at state and municipal levels. Currently, 1,043 municipalities have a unit dedicated to women's issues. Although it is significant, there is a long way to go to cover all of the 5,561 municipalities (IBGE Censo 2010).

LGBT Issues

The Ministry of Health created the initiative Brazil without Homophobia in 2004, which advocates for gay and lesbian rights. The National Family Plan Policy created in 2007 recognizes homosexuals and transsexuals as Brazilian citizens with full citizenship, including sexual and reproductive rights. Since 2011, some states and municipalities recognize civil unions. However, because of the absence of legislation legalizing same-sex marriage, the partners' legal status remains single, lacking the legal parity of heterosexual marriages. The partners have no access to inheritance or to benefits that heterosexual couples enjoy, such as employer-provided health care.

The focus on gays, lesbians, and transsexuals is new. However, since 2002, private and public health care providers have delivered male-to-female sex-alteration surgery and hormonal treatment. In 2010, female-to-male sex-alteration surgery became more available. Hospitals now provide both breast removal and hysterectomies, but they still lack penile reconstruction capabilities.

Violence against Women

According to the Institute for Public Safety in Rio de Janeiro State, women victims of violence in many crime categories are overwhelmingly of African descent: 55.5 percent of victims of homicide, 51 percent of victims of homicide attempts, 52.1 percent of bodily injury, and 54 percent of rape and sexual assault. Domestic workers, most of them black and mixed-race women, are the most

vulnerable population, as the members of the employing family often assault them (Pitanguy and Barsted 2011, 349).

Indigenous women are also victims of gender violence and sexual assault. In addition to a lack of access to support services, they are victims of poverty, ethnic and racial discrimination, and social exclusion. Women from rural and poor areas are victims of patriarchy, which manifests itself in aggressions and unlawful activities promoted by ranch owners, especially in the Amazon region. The international sex trade thrives in this area, where girls are often sold to prostitution and also kidnapped by trafficking networks. Brazil, along with countries in Africa and Eastern Europe, shares the distinction of being a primary source for global sex trafficking (Seager 2009, 56).

According to the *Mapa da Violência*, 40 percent of homicides and violent deaths of women occur at home, compared to 17 percent for men. It is deeply troubling that women continue to be unsafe in their own homes (Pitanguy and Barsted 2011, 368).

The Rio de Janeiro state collects data regarding domestic violence, and in 2010, 62.9 percent of victims of domestic violence injury were women, and more than half of these victims (50.9%) were women assaulted by current or former intimate partners. For homicides, 13.3 percent of victims were women who were in a relationship with the aggressor. This situation confirms the domestic nature of violence against women, but additional research is needed to identify conditions that lead to crime and violence, how to increase crime reporting, and the risks of violence among different social groups. This data will be useful to reconfigure law enforcement and public safety units at all levels to address these issues (Pitanguy and Barsted 2011, 369).

Religious and Cultural Roles

An amalgam of Roman Catholicism, African polytheism, and indigenous peoples' beliefs shaped the religious landscape, increasing its diversity during the course of the 20th century. According to the 2010 Census, 86.8 percent of Brazilians declared themselves Christian; among them, 64.5 percent identified as Roman Catholic and 22.2 percent as Evangelical Protestant, including Pentecostal, the denomination that has experienced great success in attracting new members. Most of the immigrants maintained their religions, Germans with Protestant practices and Japanese with Buddhist beliefs. Atheists who follow

no religion represent another segment that grew during the last century, representing 8 percent of the population. In 2007, through a program sponsored by the United Nations and the Brazilian government, Palestinian-Iraqi residents displaced to Jordanian refugee campus during the Iraqi War were resettled in Mogi das Cruzes, a city in the São Paulo metropolitan area. This pocket of the Muslim community, especially the visibility of hijab and burqa-clad women, adds to the tradition of religious diversity.

The expansion of Pentecostal churches parallels the significant internal displacement and resettlement of a poor and less-educated population from rural and interior regions to metropolitan areas. In search of employment, they settle in the periphery of urban areas and *favelas* (slums), where traditional Catholic Church and municipal infrastructure, such as electricity, water, sewage, and schools, are often unavailable. Pentecostal churches have created firm roots within these communities, offering religious and spiritual guidance along with social services, resulting in increased political visibility. The most successful denominations are Assembléias de Deus (Assembly of God) and Igreja Universal do Reino de Deus (Universal Church of the Kingdom of God), with 12 million and 1.8 million members, respectively.

Compared to the 1970s, when 91.8 percent of Brazilians declared themselves Roman Catholic, the Catholic Church has seen a significant reduction in membership in recent years. This decrease can be attributed to many factors, including its inability to address the concerns most pressing to its members, such as advocacy for reproductive rights and sexual freedom, the end of celibacy for priests, and the ordination of women priests. Although Pentecostal churches do not directly engage with all of these issues, they embrace women's participation and enforce the importance of family integrity, a value that resonates with many women. Other religious traditions also value women's participation in their public performances. In Afro-Brazilian syncretic religions, such as *candomblé* in Bahia, and in some instances, spiritism mixed with African traditions, women priests and mediums possessed by spirits have center stage in religious ceremonies and have leadership roles (Parés 2007, 213).

This shift away from Roman Catholicism can be considered generational. Catholics are most numerous among those 40 years old and older, a generation exposed only to Catholicism during their formative years. In contrast, Pentecostals tend to be younger and have been exposed to a more diverse religious landscape.

Issues

The Maria da Penha Law

The Maria da Penha Law enacted in 2006 represents a triumph of feminist activists and their advocacy for victims of domestic violence. The law is named after Maria da Penha Fernandes, a pharmacist who endured domestic violence for more than 20 years at the hands of her husband, a university professor. During this time, he twice attempted to kill her and left her paraplegic, but the judicial system failed to bring him to justice. The case was brought to the attention of the Organization of American States, Inter-American Commission of Human Rights, by Brazilian women's rights activists. The commission ruled against the husband and condemned the government for inaction and negligence. This example represents successful advocacy by Brazilian human rights and feminist organizations that used international bodies to denounce and punish the violation of human rights and to change legislation (Cintrão 2011, 218).

The Maria da Penha Law defines the national policy for gender equality or, more specifically, the responsibility of the state's civic and penal measures to protect victims and punish the aggressor. The law is based on the *Convenção de Belém do Pará* that establishes the need for investigation and compilation of data along with other relevant information to create prevention measures, mete out punishment, and ultimately eliminate violence. The law also established the Court for Domestic and Family Violence against Women under the Special Secretariat of Policies for Women.

Since the enactment of the Maria da Penha Law, Brazilians are more aware of domestic violence-related issues and the support available to counter them. A study in 2009 revealed that 78 percent of surveyed individuals were familiar with the law, a 10 percent increase from 2008. The same study revealed that 55 percent of those interviewed personally knew about an incident involving violence against women. Among them, 39 percent offered some kind of support to the victim, and 56 percent thought that domestic violence was the most serious problem for women.

According to the study, 44 percent of interviewees believed that the Maria da Penha Law was effective, and 48 percent believed that individuals who came from positive and caring families were unlikely to engage in domestic violence. As for the reasons for the violence, the interviewees mentioned high alcohol consumption, jealousy toward

the partner, and, more significantly, unemployment and poverty. Of the reasons cited for the victims to continue the relationship with the aggressor, 24 percent mentioned the lack of economic autonomy, 23 percent attributed it to the presence of children, and 27 percent believed the women stayed because of the fear of physical and violent retribution (Pitanguy and Barsted 2011, 373).

Significant changes in legislation and societal values in recent years have advanced the lives of Brazilian women. However, advocacy to improve the lives of black, multiracial, rural, and indigenous women must continue along with efforts to neutralize cultural traditions that consider women exclusively in the domestic sphere.

C

Canada

Overview of Country

Canada is located in North America and is north of the United States, east of the state of Alaska, and southwest of Greenland. It extends from the Atlantic Ocean to the Pacific Ocean. The Arctic Ocean lies in the northern part. Canada is the second-largest country in the world, and it shares the longest border in the world with the United States.

Great Britain declared Canada a country through an act of Parliament by way of the British North America Act of 1867 (now referred to as the Constitution Act—a subsection of the Canada Act of 1982). The country was then composed of only four provinces: Nova Scotia, Quebec, Ontario, and New Brunswick. Canada became completely independent from the United Kingdom in 1982 under the Constitution Act, which declared the Constitution of Canada to be the supreme law of the nation; it includes some 30 acts and orders.

Canada has a dual legal system known as *bijuralism*, which requires that all laws be drafted federally and also in regard to the local and regional laws of the individual provinces. Canada is considered a federation and is made up of 3 territories and 10 provinces. The territories of Yukon (YT), the Northwest Territories (NT), and Nunavut (NU) differ from the provinces of Alberta, British

Columbia, Manitoba, New Brunswick, Newfoundland and Labrador, Nova Scotia, Ontario, Prince Edward Island, Quebec, and Saskatchewan. Federal law created the territories. However, the Constitution Act of 1982 created the provinces. The federal government maintains significant control of the territories, whereas provinces have more control over their land and rights. The city of Ottawa, Ontario, is the nation's capital. Queen Elizabeth II has been the Canadian monarch since February 6, 1952. The country follows a parliamentary democratic form of government. Canada has two national languages: English and French.

Canada's total population as of July 2016, is 35,362,905 (CIA 2017). It has had a 1 percent average population growth since 2000 (World Bank 2015). The gross national income (GNI) per capita is CAN\$54,325 as of 2013. Canadians under the age of 15 comprise 16 percent of the population. There has been a steady decrease of the number of people in this age group since 1995, when they made up 21 percent of the population. Canadians aged 15–64 make up approximately 66 percent of the population, and individuals aged 65 years and older constitute 18 percent of the population (CIA 2017). The current life expectancy of females born in Canada is 84.6 years. The death rate is 8.5 per 1,000 people, and the crude birth rate is 10.3 per 1,000 people (CIA 2017).

The Conservative Party of Canada and the Liberal Party of Canada have historically been the two main political

Missing and Murdered Indigenous Women and Girls

In 2013, the Royal Canadian Mounted Police (RCMP) released a study that reported nearly 1,200 missing and murdered indigenous women and girls (164 missing and 1,017 murdered). Of these cases, 225 are unsolved. These numbers indicate that indigenous women are “over-represented among Canada’s murdered and missing women” (RCMP 2014). The RCMP claims that indigenous women are four times more likely to go missing or be murdered than other Canadian women (Murphy 2015).

Indigenous communities, however, suggest the number of missing and murdered women could be much higher than those officially reported. Some suggest the combined total could be as high as 4,000. Indigenous activists complain that police often underreport or fail to investigate suspicious deaths, particularly if the women were suspected of being involved in the sex trade.

Responding to concerns, Prime Minister Justin Trudeau announced a national inquiry into these disappearances and murders in November 2015. The commission began its work September 1, 2016, and will run until December 31, 2018.

The Guardian. 2016. “Missing and Murdered Indigenous Women in Canada Could Number 4,000.” February 16. Retrieved from <https://www.theguardian.com/world/2016/feb/17/missing-and-murdered-indigenous-women-in-canada-could-number-4000>.
Murphy, Jessica. 2015. “Canada Pledges ‘Innovative’ Inquiry into Violence against Indigenous Women.” *The Guardian*, November 19. Retrieved from <https://www.theguardian.com/world/2015/nov/19/canada-violence-against-indigenous-women-investigation-justin-trudeau>.

parties. However, a significant number of people belonging to the Bloc Quebecois and the New Democratic Party have gained in popularity over the past few years. The current prime minister of Canada is Justin Trudeau, who took office in November 2015. He is a member of the Conservative Party of Canada. Twenty-six percent of the national parliament in Canada is composed of women (World Bank 2017b).

Aboriginal and First Nations Populations

Aboriginal people, or First Nations people, make up a significant part of the Canadian population, and they have their own form of government. The federal Indian Act (part of the Constitution Act of 1867) outlines the rights and responsibilities of First Nations people in terms of governance, laws, and federal reserve lands. While protecting people with indigenous ancestry, the act itself was rooted in a blatant attempt to assimilate native peoples:

“The great aim of our legislation has been to do away with the tribal system and assimilate the Indian people in all respects with the other inhabitants of the Dominion as speedily as they are fit to change.”

—John A. Macdonald, 1887

From this legislation came a lot of activism and organized civic activity. First Nations women tribal members formed the Indian Homemakers’ Association of British Columbia, with the goal of improving living conditions for women in their communities. In the early part of the 20th century, homemakers were provided with grants from the Department in Indian Affairs. Funds were used to indirectly host fund-raising events and activities to raise money for community improvements as well as to politically leverage their representation and collective voices through petitioning and legislation.

Overview of Women’s Lives

In 2015, the UN Development Programme (UNDP) ranked Canada 9th out of 188 nations based on its Gender Inequality Index (GII, 0.129) among other indices (UNDP 2015). Canada ratified the Convention on the Elimination of All Forms of Discrimination against Women (CEDAW) on December 10, 1981.

Girls and Teens

Canadian teachers ranked cyberbullying as their issue of most concern. Eighty-nine percent reported that bullying

Women's Voices

Doreen Spence

Doreen Spence is a Native Elder from Alberta, Canada, who founded and is executive director of the Canadian Indigenous Women's Resource Institute. She is of Cree ancestry and is a registered nurse who practices traditional Native healing and works for human rights for indigenous peoples. She has participated in the UN Working Group on Indigenous Populations and has spoken all over the world about indigenous rights.

In 2002, Spence worked with the Slovakian government on their relationships with the Roma population. In 2005, she was one of the women of the 1000 Women Project nominated for a Nobel Peace Prize. The 1000 PeaceWomen Project selected 1,000 women from 150 countries whose work has advanced the cause of peace building and justice. She has been awarded the Alberta Centennial Medal for her work on human rights, the Woman of Vision Award, and the Racial Harmony Award for Peace and Unity. "My job is to break down every myth and stereotype there is about Aboriginal women. . . . That's my greatest challenge—in this lifetime, anyway," she said (Bacquie 2005).

and violence are serious problems in Canada's public school system. Between 4 percent and 12 percent of boys and girls in grades 6–10 report having been bullied once a week or more. For girls, bullying behavior increases in grades 6, 8, and 9 to 37 percent. Since 2002, incidences of fighting have increased in Canada's public school system. In 2008,

8 percent of girls reported having been in four or more fights. Girls are more likely to experience indirect forms of bullying, such as cyberbullying. However, incidences of sexual harassment increased for girls in grades 9 and 10 (Canadian Red Cross 2017).

The level of sex education in Canada varies across provinces. In Ontario, for example, children are introduced to the proper names for genitalia by first grade, the physical changes that occur during puberty in fourth grade, and how to prevent sexually transmitted infections in the seventh grade. However, in Quebec, there is no formal sexual education curriculum. This curriculum is integrated into other academic subjects (Young 2015).

In 2009, there were approximately 677,000 incidents of sexual assault in Canada. Seventy percent of these incidents included female victims. Most of the incidents involved unwanted touching or fondling. Fifty-eight percent of the perpetrators were people the victims knew. Furthermore, Aboriginal people experienced higher rates of sexual assault than non-Aboriginal people.

Teen pregnancy is on the rise in four provinces. There was a 40 percent increase in teen pregnancy rates in New Brunswick, a 36 percent increase in Newfoundland, a 17 percent increase in Nova Scotia, and a 15 percent increase in Manitoba. Socioeconomics is the primary cause. Teenage pregnancies are more likely to occur in areas with limited education and employment opportunities. However, the rate of teenage pregnancy across Canada has steadily decreased since the 1970s (*CityNews* 2013).

According to a 2002 survey, almost 2 percent of women between the ages of 15 and 24 suffer from an eating disorder (Government of Canada 2006). In a 2000 study of 5-year-old girls, researchers found that most girls associated a *diet* with food restriction, weight loss, and being thin (Abramaovitz and Birch 1157). Teasing pertaining to body issues can have a very negative emotional impact on girls' self-esteem. According to a 2007 study, girls who reported being teased by family members about their body were 1.5 times more likely to engage in binge eating and extreme weight control behaviors five years later (Neumark-Sztainer et al. 359).

According to a 2013 study, immigrant women who have lived in Canada for at least five years "have almost twice as many children of preschool age as the average Canadian-born woman" (Todd 2013). Furthermore, there are major differences in birth rates depending on the immigrant's home country. Women who have the highest birth

rates are typically immigrants from Africa, Pakistan, and India, while the women who have the lowest birth rates are immigrants from Europe, the United States, and East Asia (Todd 2013).

Education

The public expenditure on education as a percentage of gross domestic product (GDP) is slightly higher in Canada, 5.3 percent in 2011, than in the United States (4.9%), but it is on par with other countries such as Mexico (5.2%) and higher than that of many other places in the region (Guatemala 3.0%, Dominican Republic 2.1%) (CIA 2017).

Among pre-primary school students, girls and boys have similar enrollment rates at 72.5 and 72.6 percent respectively. This diverged in primary school; the gross percentage enrollment for girls was 99 percent compared to boys at 100 percent. All data are from 2008–2012 (UNICEF 2013).

Fewer and fewer students have been dropping out of high school in Canada over the past couple of decades. As of 2010, there were fewer female dropouts (6.6%) than male (10.3%) (CBC News 2010). According to a Statistics Canada study, girls exhibit a higher level of commitment to school than boys, which is why they are less likely to drop out of high school (Statistics Canada 2002). Furthermore, the provinces of Nova Scotia (87%), Prince Edward Island (87%), and Ontario (86%) had the highest graduation rates in the country (Motskin and Gallinger 2015).

Since 2000, women aged 25–54 have had increased rates of postsecondary education completion. More girls than boys are earning high school diplomas within the expected time frame, and a greater percentage of women are earning college degrees. In 2009, 28 percent of women aged 25–54 earned a bachelor's or postgraduate university degree (Statistics Canada 2015). Many of the students earning these higher degrees are also working paid jobs outside of school. Female students were more likely than their male counterparts to work part-time. Thirty-eight percent of full-time female students aged 15–19 were working part-time, compared to 28 percent of men. A similar difference could also be seen among those aged 20–24 (Statistics Canada 2015).

As of 2014, there were more women than men getting postsecondary degrees. For women aged 25–34, 94 percent had a postsecondary education, compared to 91 percent of men (Statistics Canada 2016). In 2014–2015, there

were 979,000 full-time students and 312,000 part-time students enrolled in Canadian universities (Universities Canada 2016). As of 2006, women made up 58 percent of full-time undergraduates enrolled.

Health

Canada employs a publicly funded health system referred to as Medicare. Unlike other countries with singular universal health care, Canada's system is composed of 13 interconnected health insurance plans offered through the Canadian provinces and territories. The need for a universal health care system was inspired by the economic dissolution and subsequent recovery from the years of the Great Depression through World War II and originally was largely supported by federal workers and progressive doctors.

The Canada Health Act (CHA), adopted in 1984, outlines regulations upon which federal monetary reimbursement is provided to the provinces and territories. The CHA is neutral on how care is provided as long as certain criteria are met. Compliance from the 13 sectors is not mandatory; however, the financial incentives of providing care in accordance with the CHA have made the legislation a solid and successful law. Funding for the CHA is generated through personal and corporate taxes as well as by other means, such as sales tax.

Access to Health Care

The World Health Organization (WHO) ranks Canada 30th in overall health care. Canada was also ranked as having one of the most responsive health care systems as well as the country with the fairest mechanism for health system finance (WHO 2000). The Conference Board of Canada, a nonprofit organization that measures Canada's standing among 16 peer countries, gives the nation a B average in health ranking overall. While this is considered a solid middle-of-the-road ranking for an industrialized nation, several factors appear to keep Canada from achieving higher levels of health standing for developed nations. Canada received C ratings in the following four areas: mortality due to cancer, diabetes, musculoskeletal system diseases, and infant mortality.

The primary goal associated with Canadian health care policy is “to protect, promote and restore the physical and mental well-being of residents of Canada and to facilitate

reasonable access to health services without financial or other barriers.” The CHA operates based on five main principles (Canadian Health Care 2007):

- **Public Administration:** Implementation must be carried out on a public, nonprofit basis.
- **Comprehensiveness:** All care providers must be insured.
- **Universality:** All citizens with provincial insurance are entitled to equality of care.
- **Portability:** Residents who move within the country or travel are entitled to coverage from their place of origin.
- **Accessibility:** All insured citizens are entitled to health care access, and all providers are entitled to be compensated for their services.

Maternal Health

The *International Classification of Diseases* defines “maternal death” as follows: “The death of a woman while pregnant or within forty-two days of termination of pregnancy, irrespective of the duration and the site of the pregnancy, from any cause related to or aggravated by the pregnancy or its management but not from accidental or incidental causes” (Public Health Agency of Canada 2013b). As part of WHO’s Millennium Development Goals set by the United Nations for 2015, maternal deaths are tracked on a global scale. While the overall death rates for women in childbirth have fallen globally by 45 percent since 2005, Canada’s maternal mortality rate increased. The leading causes for maternal mortality in Canada are pulmonary embolisms and preeclampsia, or pregnancy-induced hypertension; amniotic fluid embolism; and intracranial hemorrhage (Public Health Agency 2005).

In 2015, the adolescent fertility rate for young women aged 15–19 was 7 births per 100,000 women (World Bank 2017a). The fertility rate in Canada is 1.6 children per woman, and the maternal mortality rate is 8.5 deaths per 100,000 live births (CIA 2017). The maternal mortality ratio has stayed at 7 per 100,000 live births from 1990 to 2015. The lifetime risk of maternal mortality is 1 for every 8,800 women (World Bank 2015).

Diseases and Disorders

STIs/STDs

The Public Health Agency of Canada established the Sexual Health and Sexually Transmitted Infections Unit,

which works with provinces, nongovernmental organizations (NGOs), and health care providers to improve and maintain Canadians sexual health and well-being. Their goal is to help in the prevention and control of sexually transmitted infections and their complications.

Chlamydia is the most commonly reported sexually transmitted infection in Canada. The rates of reported cases of chlamydia have risen steadily since 1997 due to improved lab testing and screening and because people are being inconsistent in using safer sex practices. Chlamydia also disproportionately affects women ages 15–24 (Government of Canada 2017). Gonorrhea is the second most commonly reported sexually transmitted infection (Canada.com 2017), and an estimated 35 percent of hepatitis C infections in Canada are among immigrants (Trubnikov et al. 2014). The infection rate for herpes simplex 2 for women was 16 percent (Branswell 2013).

The situation is even more dire among the First Nations and Aboriginal population. Chlamydia is estimated to be almost seven times higher among First Nations adults, and rates of HIV/AIDS are also disproportionately higher among Aboriginal persons. The rate of new HIV infections among the Aboriginal population is estimated to be 3.5 times higher than that of the non-Aboriginal population (Public Health Agency of Canada 2013a).

HIV/AIDS

Since 1985, a total of 76,275 positive HIV test results have been recorded by the Public Health Agency of Canada. Thirty years ago, when the first cases of HIV were being recorded in Canada, nearly 80 percent of emerging cases were ascribed to men who had had sex with other men. Since then, the distribution to other categories of infected individuals has become more evenly dispersed among heterosexual contact (32.6%) and intravenous drug use (14%), with a higher percentage of women than men becoming infected in this manner (Public Health Agency of Canada 2012). In Canada, 2.2 percent of the population lives with HIV (Public Health Agency of Canada 2012).

Immigrants and refugees living in Canada represent the most challenging sector of the population to measure in terms of overall health as well as sexual health. Migrant groups are often less likely to seek medical services out of fear or lack of access. They also may experience a block in communication with health professionals due to a language or cultural barrier or have a vastly different belief system regarding sexual health. Other factors such as mental health, gender power differentials, or a history of

torture and rape in their home countries can isolate members of these social groups.

Tobacco Use

Smoking and tobacco use in other forms continues to be the leading cause of preventable death in Canada, with more than 37,000 people dying on an annual basis. Surveys conducted and data compiled by Health Canada and Statistics Canada in 2014 show that smoking is also the leading cause of cancer at 85 percent of diagnosed cases. While smoking has been on the decline overall during the past decade, this decline is gradually leveling off, and a 2012 report by these two organizations shows that 16.1 percent of adults are smokers. Gender differentials in smoking cessation have held steady in the late 1990s, with male smokers consuming on average four more cigarettes per day than female smokers.

Youth tobacco use statistics displayed in both reports show that 15.5 percent of students in grades 6–9 had tried cigarettes or other forms of tobacco, with roughly 2 percent identifying as current smokers. These statistics were divided almost evenly among boys (2.2%) and girls (2.1%) (Propel Center for Population Health Impact 2014).

Mental Health

Through a unanimous provincial and territorial vote (excluding Quebec), Canada's federal government formally established the Mental Health Commission of Canada (MHCC) in 2007. The primary goal of the MHCC is to build and maintain a network of partnerships between the justice system, local government, hospitals, social services, and workplaces to better address the issue of mental illness and to provide both treatment and preventive care to Canadian citizens. Funding for the MHCC is provided by Health Canada under a 10-year mandate. The first initiative was to establish the country's first mental health strategy, which is currently to reduce the social stigma around mental health issues. MHCC has established suicide and distress crisis centers throughout all the nation's territories and provinces. Centers are open 24 hours a day for individuals to call or appear in person.

Women in Canada suffer most from three different mental disorders: depression, anxiety, and somatic complaints. Additionally, unipolar depression is twice as common in women. Women are more likely to seek help for their mental disorders from their primary health care physician, but they are less likely to disclose issues with alcohol abuse (WHO 2017). Approximately 12 percent

of young females, ages 12–19, have experienced a major depressive episode (Canadian Mental Health Association 2016).

Following multinational studies showing the effectiveness of Internet-based mental health help, the MHCC has also focused on developing wider accesses to mental health outreach and treatment through e-Mental Health Counseling, using technology to connect individuals with fully accredited mental health professionals specializing in various areas of need. This can help both rural women and women who have many family responsibilities in terms of access.

The Canadian Mental Health Association (CMHA) publicly recognized that women's issues in terms of mental health are not studied or funded nearly to the degree as men's issues. Furthermore, they state that education for all health professionals often lacks balanced approaches to caring for the physical and mental health needs of women. Risk factors for women either developing mental health issues or seeking treatment include socialization as girls, normalization of physical and sexual abuse, the persistence of gender roles in society, and the prevalence of poverty as individuals or as caregivers. As cited by Heather Pollett, for the Canadian Mental Health Association of Newfoundland and Labrador, trauma throughout the lifetime of a woman can lead to adult-onset mental health issues. Furthermore, while everyone is different, traumatic experiences, physical and psychological, can have a greater impact on women who are genetically predisposed to mental illness.

Employment

The number of women entering the workforce has been on the rise since the 1960s. The growing number of female employees during this time was shaped by an increase in the number of service jobs. These positions, often in domestic service, clerical work, teaching, nursing, and retail sales, were thought of as "female" jobs and thus came along with women earning lower pay for "women's work." Employers often sought to pay female employees less because their income was supplemental to their husband's earnings, and men were viewed as being the primary breadwinners.

The view of women as sources of cheap labor continues today and is reflected in unequal pay between women and men, commonly termed the *wage gap*. For example, full-time working women earned 52.8 percent of what full-time working men earned in 1911. The gap had decreased slightly by 1971, with women earning 58 percent of what men were making. The gap decreased a bit more by 1998,

with Canadian women making 72 cents for every dollar men earn, but the number has only stabilized over the past 10–15 years and has never risen about 72 cents on the dollar for women. The wage gap also varies by province and is a bit narrower in Ontario, with women earning 74 cents for every dollar earned by male workers as of 2011 (Statistics Canada 2010).

All provinces have some type of legislation or statute that addresses issues of pay equity and gender. Canada first legally acknowledged concerns of gender and wage inequalities in 1972, when it officially ratified the UN International Labor Organization's Convention No. 100, the Convention Concerning Equal Remuneration for Men and Women for Work of Equal Value. One of the most notable pieces of legislation that resulted from this action was the passing of the 1987 Pay Equity Act by the Ontario government. This act established minimum requirements for employers of employees who held female-dominated occupations as a way to combat gender discrimination in wages.

The total labor force participation of females aged 15 and over was 61.6 percent in 2012. This percentage of participation has remained relatively consistent since 2004, when the percentage of participation was 61.2 (Statistics Canada 2010).

Pay Equity and Labor

One of Canada's key rights documents is the Canadian Human Rights Act, which protects Canadians against discrimination in areas under federal jurisdiction. The Canadian Human Rights Act is federal legislation that prohibits discrimination in areas of federal jurisdiction. Its guiding principle is that all individuals should have an equal opportunity to make for themselves the lives they are able and wish to have and to have their needs accommodated.

Although Canada has several federal laws and acts designed to solidify equality in the labor force, equal pay for equal work between Canadian women and men is still a goal in progress. Section 11 of the Canadian Human Rights Act establishes freedom from gender-based wage discrimination as a basic human right in Canada. Individual provinces and territories have the responsibility of maintaining their own minimum wages, and employers hold the responsibility that gender-based discrimination does not exist within their organizations in accordance with the law. According to Statistics Canada data (2012), the gender wage gap in Ontario shows that for every dollar earned by a male worker, a female worker earns 74 cents

and that upward of 10 to 15 percent of the gender wage gap is due to discrimination (Statistics Canada 2010). However, other factors, such as family caregiving responsibilities and lack of education, are still factors in overall pay discrepancy.

Women, along with ethnic members of the Canadian population, have always been a key part of Canada's workforce, but, historically, they have been undercompensated for their work or labored entirely without pay in jobs that traditionally compensated men. As such, starting in the 1950s through the present, labor unions played an important role in helping employees organize for the purpose of bargaining as well as advocating for legislation regarding pay equity and workplace protections. Women's Minimum Wage Acts were established throughout the provinces. One such law was successfully sponsored by Irene Parlby, an English woman from an aristocratic family who married an Alberta farmer and became the first female cabinet minister in Alberta. As these laws were enacted, women workers in Canada became some of the first workers to benefit from a codified minimum wage.

Racialized Canadian women earn almost 57 cents to every dollar paid to nonracialized Canadian men, and racialized female immigrants earn almost 49 cents for every dollar nonracialized male immigrants earn. This income gap comes from disparities in the distribution of secure good-paying jobs (Block and Galabuzi 2011). Furthermore, racialized women in Canada are 48 percent more likely to be unemployed than nonracialized men (Block and Galabuzi 2011).

Child Care

Since 1995, the need for child care has steadily increased with more women working and the related increase in dual-income families (Statistics Canada 2010). The demand for quality child care has also increased due to the benefits of peer socialization, school readiness, and numeracy and language skills (Nores and Barnett 2010). Approximately 50 percent of all Canadian parents used some form of child care for their children ages 14 years and younger in 2011, and parents in Quebec were most likely to use care (Statistics Canada 2014a).

Family Life

Family life has experienced some major shifts over the past 50 years. The traditional family structure has

historically been rooted in the ideals of having and maintaining a nuclear family made up of a husband, wife, and children. Marriage has typically been a religious ceremony performed by a member of the church, and at the turn of the 21st century, more than three-quarters of marriages in Canada were still religious even though civil ceremonies and common-law marriages have been on the rise. However, rates of marriage overall have been in decline since the early 1970s. Canada has experienced a significant drop in the number of individuals getting married in a manner recognized by the government (OECD 2011). The divorce rate in Canada has also increased since the 1970s. Just over a quarter of the Canadian population lives in single-person households, whereas more than 50 percent are composed of heterosexual or homosexual married couples. Sole-parent families are also increasingly common in Canada, and as of 2009, more than 80 percent are sole-mother households versus 20 percent for sole-father households (OECD 2011).

The average age a person gets married in Canada has also risen since the early 1970s. The average age of marriage in the 1970s was 23 years of age for women and 25.4 years of age for men. With changes to the economic structure of Canadian society and with more women entering the workforce, many have chosen to delay marriage. By 2010, the average age of marriage for women was 29.7 years of age, and for men it was 31.7 years of age. The changes in gender and employment have also affected the gendered division of labor within the household. Traditionally, men were viewed as the primary wage earners for a family, and women were expected to attend to the housework, child care, and any other domestic service needs. Although the division of household labor was usually a gender division in the early 20th century, the gap began to lessen during the 1980s as more women started to earn an income. By 1986, 48 percent of men and 78 percent of women reported doing some sort of household labor. The gap decreases even further when entering the 21st century, and by 2010, 65 percent of men and 76 percent of women reported doing some form of housework (Eichler 2012).

Canadian women have also delayed childbearing. The average age of women who gave birth to their first child in 2011 was 28.1 years of age (CIA 2017). The number of children women are having in Canada has also experienced a sharp decline since the 1960s. In the early 1960s, women were having approximately 3.9 children. The number declined drastically to an average of 1.5 children per

woman by the beginning of the 2000s (Statistics Canada 2012).

Households with nontraditional families are also increasingly common in Canada. As more individuals are rejecting government-sanctioned marriage, more are cohabitating, where they live with a significant other or domestic partner but have not yet chosen get married or have decided to not get married at all. Almost 9 percent of Canadians over the age of 20 are currently living in a cohabitating household. The number of unmarried cohabitating couples living with children also increased over the past few decades. Almost 45 percent of cohabitating partners live with children. The number increases to only 56 percent for married couples living with children. Family size has also been decreasing, and by the late 2000s, 39 percent of households had no children, 27 percent had one child present, 24 percent had two children present, and only 10 percent had three or more children living in the household (Statistics Canada 2012).

Family Law

In 1911, Emily Murphy, a writer and suffragist, organized other women to help pass the Married Women's Protective Act (the Dower Act). This action was inspired by the story of a local woman who was left alone with her children when her husband sold their farm, took the profits, and abandoned the family with nothing. The Dower Act stated that a married woman was entitled to one-third of her husband's estate, thus granting women at least partial ownership in marital property. By the late 1970s, all provinces in Canada had enacted or changed their family laws so that financial and household responsibilities were considered of equal responsibility for both men and women.

The 1985 Divorce Act (which replaced the repealed 1968 Divorce Act, the first in the nation) established looser guidelines by which divorce is granted to married couples. Divorce can now be considered "no-fault" and based on the complete breakdown of marriage, which tends to be defined because of some evidence of cruelty, fraud, or adultery or from a year of established separate living arrangements. The Divorce Act also outlines the guidelines for determining child custody in the event of divorce. In cases where both parties work full-time, it has become somewhat more acceptable for primary custody to be granted to the father, even though significantly more women are given primary custody.

Adoption

Adoption is primarily regulated by individual provinces and can be carried out through a public or governmental entity, such as the Children's Aid Society, or privately through any number of licensed agencies. Same-sex adoption is permitted in Canada, with the only restrictions being ones instituted by outside countries in the case of international adoptions.

Adoption between or within Canadian Aboriginal families is governed by individual provinces and territories in accordance with the Aboriginal Custom Adoption Act of 1995. Custom adoption was first established in the Northwest Territories in 1961 and became more formalized by the Ministers of Justice and Social Welfare in the early 1990s before being signed into law.

Custom adoptions are quite common in Canadian Aboriginal culture. They are based on a tradition where one family privately places their child with another family in the community. This type of adoption is seen as a way to keep children within their own communities to help them maintain their sense of identity. Custom adoption allows the transfer of parental rights to take place with little to no intervention from lawyers or social workers. Custom adoptions are overseen by a community-chosen adoption commissioner, who assists families in completing paperwork, facilitates interactions with the Supreme Court, and ensures that familial cultural integrity is upheld in the process (Adoptive Parents CA 2009).

Same-Sex Marriage and Families

Canada was one of the first few countries in the world to provide marriage rights to same-sex couples. The federal Civil Marriage Act was passed in July 2005 and granted full marriage rights and benefits to same-sex couples in all provinces and territories. Before the federal legislation, British Columbia and Ontario had been the first 2 provinces to legalize same-sex marriage in 2003. By the time the Civil Marriage Act was passed, 9 out of the 10 Canadian provinces and 1 of the 3 territories had already legalized same-sex marriage. Only the province of Alberta and the Nunavut and Northwest Territories did not have laws providing same-sex marriage.

Given the quickly changing landscape of same-sex marriage, very few longitudinal statistics have been collected that shed light on the married lives of gay men and lesbians. However, Statistics Canada did start to ask about same-sex partnerships in their 2001 survey. Just under

1 percent of those who responded to the survey in 2001 identified as living in a same-sex union. Statistics Canada followed up in their 2006 and 2011 survey and asked about same-sex marriage. A total of 7,465 same-sex marriages were reported in 2006, and in a near tripling of that number, a total of 21,015 couples reported getting married in 2011. These numbers reflect the increasing numbers of gay men and lesbians deciding to marry since its legalization (Statistics Canada 2012).

Of the same-sex couples who completed the 2011 Statistics Canada census, 54.5 percent were male, and 45.5 percent were female. One-fourth of gay and lesbian couples were also reported to be under the age of 34, and only 6.2 percent were over the age of 65 (Statistics Canada 2016). These numbers possibly reflect some of the hesitancy older gay men and lesbians have at "outing" themselves in a public way through a government report versus suggesting that more young people are homosexual than older individuals. This survey also reports that only 9.4 percent of same-sex couples have children living at home, compared to almost 50 percent of heterosexual couples with families. Children were also significantly more likely to be found in lesbian homes than gay male households (Statistics Canada 2012).

Although same-sex marriage has found some resolution in Canada, same-sex couples now face a set of new issues when embracing this newly awarded right. For example, details considering same-sex divorce are not set, and there is a need to protect children of same-sex parents. This issue has been addressed by various laws, such as the Income Tax Act, which replaced the term "natural parent" with "legal parent" to guarantee benefits for children. Religious groups also continue to challenge same-sex marriages, and the Supreme Court of Canada recently ruled that religious leaders can legally reject performing a same-sex marriage if it goes against their beliefs.

Politics

The Canadian government is a constitutional monarchy, which is a form of government in which a king or queen acts as head of state. The monarch remains politically neutral, according to the Canadian Constitution. The highest elected position in Canada is prime minister, which is currently Justin Trudeau.

The Canadian Parliament is composed of three sections: the monarch, the Senate, and the House of Commons. The Senate makes up the upper chamber and has

105 members. The House of Commons currently has 338 popularly elected seated officials, with 29 percent being women (Bengtsson et al. 2015). In the chamber of the Senate, 43 of the 100 seats are currently occupied by women (Senate of Canada 2017).

Five brave women from Alberta, Canada, known as the “Famous Five,” challenged the Supreme Court of Canada in 1867 about the status of women’s rights. The five women, Emily Murphy, Irene Marryat Parlby, Nellie Mooney McClung, Louise Crummy McKinney, and Henrietta Muir Edwards, sought to have women legally considered persons so that they could be appointed to the Senate (Kome 1985). The British Judicial Committee of the Privy Council overturned the decision of Canada’s Supreme Court on October 18, 1929, and ruled that women were eligible for appointment to the Canadian Senate.

Women continued their fight for equality and focused on political rights and the suffrage movement. The right to the federal vote was finally won in 1918, and by 1922, women had won the right to vote in all provinces except Quebec, where the struggle continued until 1940. In 1921, Agnes Macphail, a teacher, journalist, activist, and writer, was the first woman elected to the House of Commons. In 1929, women were recognized as “persons” eligible to hold a seat in the Canadian Senate.

During the mid-19th century, women of African descent could vote as long as they were citizens and owned taxable property. Black women did participate in the women’s suffrage movement in Canada. The Wartime Elections Act of 1917 extended the right to vote to black women who were related to black servicemen (Henry 2016). In 1982, the Canadian Charter of Rights and Freedoms guaranteed the right of all citizens to vote, regardless of ethnicity.

In 1993, Avril Phaedra Douglas “Kim” (A. Kim) Campbell, a member of the Progressive Conservative Party, was elected the first woman and 19th prime minister, where she served from June 25, 1993, to November 4, 1993. At present, British Columbia boasts the highest percentage of women representatives with 36 percent. In 2013, the Honorable Christy Clark was sworn in as the 35th premier of British Columbia. Of the 20 members of the Executive Council of British Columbia, 9 are women (Government of British Columbia 2017).

The Canadian political party system was established in the 19th century and currently maintains three major parties: the Conservative Party, the Liberal Party, and the New Democratic Party. Smaller but influential parties include Quebec’s Bloc Québécois and the Green Party.

Canada has a variety of women’s political organizations, including the National Council of Women of Canada and the Native Women’s Association of Canada. The mission of the National Council of Women of Canada is to improve conditions for women, families, and communities. The goal of the Native Women’s Association of Canada is to enhance, promote, and foster the social, economic, cultural, and political well-being of First Nations and Métis women within First Nations, Métis, and Canadian societies (Native Women’s Association of Canada 2015).

Feminism and Political Equality

In the 1980s and early 1990s, the second wave of feminism coincided with the examination of and shift in Canada’s federal government. Subsequently, through the Canadian Charter of Rights and Freedoms, women gained vital and permanent protections in the federal constitution, including protection from discrimination based on sex. Section 28 of the charter guarantees, “notwithstanding anything in this Charter, the rights and freedoms referred to in it are guaranteed equally to male and female persons” (Government of Canada 2017).

Family Violence

The general Federal Criminal Code, which encompasses all crimes violent and nonviolent in Canada, covers most acts of violence toward women and children. These crimes include physical and sexual abuse, psychological abuse, and failure to comply with probation as well as acts of theft and fraud.

Although there is no formal federal antidomestic violence act, individual provisions add extra layers of protections for Canadian women and children. Canadian criminal courts can choose to detain an accused person, restrict contact an accused person has with the victim, or require that the accused person agree to guidelines that will “keep the peace” until a trial or hearing.

The six Canadian provinces and three territories have each established specific laws regarding family violence. These laws work in congruence with the Criminal Code of Canada and offer additional protections to victims of domestic violence.

Fifty percent of all women in Canada have experienced at least one incident of physical or sexual violence since the age of 16 (Statistics Canada 1993). Furthermore, approximately every six days, a woman in Canada is killed by her intimate partner (Statistics Canada 2014b). Between 1980

Women's Voices

Heather Jarvis

Heather Jarvis is a “queer feminist activist” who cofounded, along with Sonya Barnett, the first SlutWalk in Toronto, Ontario, Canada, in 2011. As a survivor of sexual assault, Jarvis was moved to act after hearing a Toronto police officer say during a safety forum at York University that women should “avoid dressing like sluts in order not to be victimized.” Jarvis and Barnett chose to fight sexual violence by redefining “slut” as someone empowered by control of their own sexuality and through public protest, which expanded beyond Toronto to create an international movement in countries such as Colombia, India, South Korea, and the United States. SlutWalks involve local women dressing in provocative clothing and marching to call attention to gender inequality, sexual violence, victim blaming, and degrading treatment.

—Jane Harris

Townes, Carimah. 2015. “The Feminist ‘SlutWalk’ Movement Just Landed the Perfect Celebrity Spokesperson.” *Think Progress*, October 3. Retrieved from <http://thinkprogress.org/culture/2015/10/03/3708674/amber-rose-slut-walk>.

and 2012, there were approximately 1,200 cases of missing or murdered Aboriginal women in Canada (RCMP 2014). However, according to several antiviolence organizations, and even the Minister of Status of Women, the number is closer to 4,000 cases (Tasker 2016).

One of the biggest issues to emerge in the 1970s was that of domestic violence within the private sphere of the family. Three in every 10 Canadian women have experienced at least one incident of physical or sexual abuse in a current or previous marital relationship (Statistics Canada 1993). Data from 2009 show that almost 6 out of 10 (59%) women reported that children had witnessed a spousal violence incident (Sinha 2012).

Although domestic violence is an issue for all women regardless of religious affiliation, traditional religious values argue that domestic issues, violent or not, should be solved

at the home or church level and do not need to involve state intervention. The traditional view is that women have a unique role as mothers and caregivers, so they have a special connection with the domestic sphere. Men are regarded as the leaders of the family, and this organization is one based on hierarchy and submission. Whereas feminists argue that there is a community or government need to intervene in these situations, some churches have often fought back against this position and argue that family problems should be solved within the family with church support. Regardless of the religious debate, many nonprofits with or without government funding have established transition houses, also known as domestic violence shelters, with the first one being established in Canada in 1973 (Ishtar Transition Housing Society 2016).

LGBT Protections

As late as the 1960s, homosexual activity was still considered to be a criminal offense. The debate over gay rights was ignited by the Everett Klippert case. Klippert, originally arrested in an arson investigation, admitted to homosexual acts and was subsequently sentenced to prison. His 1967 appeal was denied, which upheld the criminalization of homosexuality. By 1969, the federal government had elected to decriminalize homosexuality with concern for consenting adults.

Other notable LGBT reforms and legislation include the following:

- The 1978 federal amendment to Canada's Immigration Act removed a ban on homosexuals as immigrants.
- In 1992, the ban on gays and lesbians in Canada's military was lifted.
- The 1995 Canadian Supreme Court of Canada ruling (*Egan v. Canada*) concluded that discrimination based on sexual orientation should be included in the Canadian Charter of Rights and Freedoms
- Following the 1999 upholding of the definition of traditional Canadian marriage as a union between one man and one woman, Canada nationally recognized same-sex civil marriage in July 2005, the fourth nation in the world to do so. Civil marriage recognizes the “lawful union of two persons to the exclusion of all others.”
- Shortly after, in 2005, all Canadian provinces (excluding Alberta) included sexual orientation in

their human rights acts. The Northwest Territories' charters included gender identity.

- In 2015, Bill C-279 was introduced that sought to add gender identity provisions to both the Criminal Code and the Canadian Human Rights Act. However, there was an amendment included that would restrict the use of washrooms and public facilities by people who identified as transgender. The bill passed in the House of Commons in 2013, but it never passed in the Senate (McGregor 2015).

Religious and Cultural Roles

Approximately 67 percent of religious-identified Canadians affiliate with a sect of Christianity (Statistics Canada 2011). Although slightly more women than men identify as Christians, the majority identify as Catholics in almost equal numbers of men and women. The largest population of Catholics in Canada is found in Ontario, with the second highest in Quebec (Statistics Canada 2013). In addition to Catholicism, many Canadians belong to other sects of Christianity (listed in order of prominence): United Church of Canada, Anglican, Baptist, Lutheran, Protestant, and Presbyterian (Statistics Canada 2016).

Christianity has a long history in Canada. Some of the first Europeans to arrive in Canada were Catholic missionaries from France who sought to convert native groups into becoming Christians and to suppress their traditional ways of practicing their own religion. The influence of Catholicism would continue to grow in the region, even as British armies started to take over French control in the country, which had its greatest stake in the area of Quebec, leading to the introduction of additional types of Christianity in the country. Women played an increasingly active missionary role in the later 18th century and into the 19th century. Often responsible for doing more groundwork within the native and local communities, women have not traditionally served in formal leadership positions within churches (priests, ministers, etc.).

The political movements of the 1960s witnessed some of the greatest challenges to the institution of religion in Canada. Minority groups began to challenge some of the traditional views held by and espoused by Christian churches. Women started to question the ways in which traditional values of gender, femininity, and sexuality were supported by the church, contributing to a loss of choice and autonomy. Those who were challenging the way religion negatively influenced women's lives were

often focused on issues related to unequal power dynamics within the family, most notably those leading to violence, and with issues related to women's control over their bodies and issues related to sexuality. For some feminists, these questions led to a disassociation with religion. For others, it resulted in calling for the right for women to be leaders in the church to promote some reforms. For those who supported continuing with religious connections, they fought against old paradigms and started to explore evolving and emerging definitions of family and faith.

Some scholars have found that Canada is becoming a more secularized (not associated with religion) country. In addition to critiques of traditional family structures, issues have been raised around the topics of homosexuality and reproductive choice. Traditional religious Christian views have been critical of homosexual identity, and various Christian groups fought against making same-sex marriage in Canada legal in 2005. Some traditional views have also disagreed with making abortion and contraception legal. The Criminal Law Amendment Act (1968–1969) decriminalized homosexuality, made abortion legal, and lifted Catholic-supported restrictions on contraception.

The cultural debates of the last 50 years have had a permanent impact on women's relationship to religion in Canada. Changing cultural views of sex and sexuality, the family structure, and economics and labor have also influenced this relationship. Through these cultural debates, women have emerged as agents of religious change, have increased roles as decision makers, and have provided more choices when it comes to their bodies and careers. These changes have resulted in some women's independence from various forms of organized religion. As of 2011, 7,850,605 million Canadians identified as not having a religious affiliation, and women constituted 22 percent of those who did not identify with a specific religion (Pew Research Center 2013).

Other Religions

Although the majority of religious Canadians identify as Christian, there are a significant number of other active religions in the nation. Religious minorities in the country are growing at a significantly faster pace than any of the Christian sects in the region. At 3.2 percent, the largest minority religion in the country is Islam, and there are slightly more men than women who identify as Muslim. The second-largest minority religion, as of 2011, is Hindu (1.5%), followed by Sikh (1.4%), Buddhist (1.1%), Jewish

(1%), and Aboriginal spirituality (CIA 2017). Both Hinduism and Sikhism have slightly more men than women as members, whereas there are slightly more women who identify as Jewish or believing in Aboriginal spirituality.

One of the biggest contributors to the growing Muslim population, in addition to other minority religions, is the rapid immigration taking place in Canada. Many Muslim immigrants have come to Canada over the past decade, with some of the largest groups coming from Pakistan.

One of the most contentious religious debates to hit Canada during the past decade has been focused on the issue of Muslim women and the wearing of a niqab (veil), hijab (headscarf), or burqa (full body covering) in public. Depending on the country of origin or level of conservatism of a specific Muslim sect, the wearing of this article of clothing is associated with a woman's virtue and morality and is required to be worn in public when in the company of men.

The Canadian government has responded to, and continues to debate, the legality of wearing of the niqab in various public settings. In Quebec, Bill 94 was passed in 2010, which legally requires that women must remove their niqab when dealing with the government in any capacity. This bill has received criticism from both Muslim women and feminists who argue that banning the wearing of the niqab takes away a woman's agency and choice in the situation. The Canadian Council of Muslim Women argues that the bill has been connected to increasing intolerance in Quebec toward women who wear the niqab.

As of early 2014, the Canadian Supreme Court was weighing a case that seeks to require women to remove their niqabs when testifying in court. One side of the debate believes that passing this law would ultimately serve as a further deterrent for Muslim women who would otherwise report domestic violence, sexual violence, and other sex-based offenses if they could remain covered. However, other feminists argue that the wearing of the niqab, or any form of Muslim veil or covering, in general is a form of oppression for women because it literally conceals their identity and is based on a patriarchal belief that women should remain publicly and culturally invisible.

Overall, each minority religion faces various forms of discrimination from the larger mainstream culture. Additionally, each religion has to negotiate various gendered practices as they exist within the religious community itself, and they have to navigate how these practices get interpreted, accepted, or rejected by the culture at large. For example, various Sikh communities have encountered

violence in Ontario and British Columbia, which have some of the highest Sikh populations (George and Chaze 2016, 96). Racist extremists have reportedly physically attacked members of the Sikh religion, who are often easily identifiable by their turbans, in addition to vandalizing places of worship. The Sikh religion believes in the equality of the sexes; yet, some practices may be viewed by some Canadians as being sexist, such as separate seating areas for Sikh men and women when attending gurdwaras (temples) and by requiring children to sit with the women when attending services.

Issues

Human Trafficking

Human trafficking (as opposed to smuggling) is defined as the recruitment, transportation, or harboring of persons for the purpose of exploitation, with most instances being related to the sex industry or forced labor, and currently takes place on both domestic levels within Canada and international levels involving Canadian borders. Roughly 90 percent of the 25 convictions since the addition of trafficking to the Criminal Code have involved instances related to domestic trafficking (Public Safety Canada 2012). Although movement can be a key component in trafficking, border crossing or any change in physical location is not necessary for trafficking to take place. Oppression, isolation, and fear of harm are the driving factors behind trafficking.

Women and girls are overwhelmingly the victims of human trafficking, as evidenced by successful criminal convictions of traffickers. The most vulnerable are migrant workers and new immigrants, Aboriginal women and girls, those who live in poverty, and individuals who seek work or upward mobility in populated areas but are unaware of the ease in which they could be recruited or held against their will. The Canadian Women's Foundation's national task force on human trafficking of women and girls in Canada reports that nearly 50 percent of women trafficking victims in Canada are Aboriginal (Canadian Women's Foundation 2014).

On a federal level, Canada promotes frontline training to law enforcement and public health personnel to strengthen the ability of individuals to recognize victims within the community and take proactive measures to prevent further exploitation. Canada's National Action Program (NAP) provides materials to help communities identify and assist victims. NAP also has initiatives

to strengthen child protective services as well as programs that assist economically disadvantaged women and children.

Plans for NAP include using diagnostic tools within at-risk communities to measure and predict the probability of individuals becoming victimized. It also provides for maintaining a series of national action plans for assisting individuals who have been removed from forced labor or sex industry environments with mental, physical, monetary and educational support.

Prostitution

In 2014, it became illegal to purchase sexual services in Canada, but legal to sell them. According to the Canadian Department of Justice, this new legal framework “reflects a significant paradigm shift away from the treatment of prostitution as a ‘nuisance’ toward treatment of prostitution as a form of sexual exploitation that disproportionately and negatively impacts women and girls” (Supreme Court of Canada 2014)

Mining and Indigenous Peoples

Activists from Canada’s First Nations communities have been on the forefront of challenging the development of Alberta’s oil sands. Concerned with climate change, the destruction of indigenous lands and a spike in “cancers linked to petrochemicals,” Eriel Deranger, representing the Athabasca Chipewyan First Nation, leads advocacy efforts on behalf of affected communities (Ball 2014). She is joined in this cause by many other young indigenous women, including Beaver Lake Creek Nation member Crystal Lameman and Vanessa Gray from the Aamjiwnaang First Nation in Southern Ontario, who have each agitated against Canada’s energy industry (Curtis 2016). Lameman led a healing walk and Gray participates in direct action (Lim 2014; Curtis 2016). They are just a few examples of a rising indigenous youth movement, 30,000 of whom are university or college educated, supported by and participating in the Idle No More movement and inspired to be the change they want to see (Friesen 2013).

Cayman Islands

Overview of Country

The western Caribbean nation of the Cayman Islands is composed of three islands that lie about 400 miles south of Miami, Florida; 150 miles northwest of Jamaica; and 150 miles south of Cuba. At roughly 10 miles long and with a surface area of almost 11 square miles, Little Cayman is the smallest of the three islands. Its slightly larger sister island, Cayman Brac, lies 5 miles east, is nearly 12 miles long, and has a landmass of 15 miles. Little Cayman and Cayman Brac sit approximately 90 miles to the northeast of the main island, Grand Cayman. As the largest of the three islands, Grand Cayman's landmass is nearly 76 square miles (CIA 2016). Although the islands span a vast region of the Caribbean, their landmass is comparable to that of Washington, D.C.

Encountered by Christopher Columbus (1451–1506) in 1503, the islands came under Spanish rule until 1670, when Spain ceded them along with Jamaica to British rule (BC 2016). In the 18th and 19th centuries, colonizers from Jamaica came to the islands and installed Jamaica to administer the government. This lasted until 1959, when

the Federation of the West Indies took over, making the islands one of its territories. After the federation dissolved in 1962, the Cayman Islands chose to remain a British dependency. The islands gained greater autonomy in 1972 and again in 1994 through constitutional changes. Caymanians gained British citizenship in 2002, underscoring their relationship and enabling qualified persons to hold a British passport. (CIA 2016; BBC 2016).

In the 1970s, the culture shifted to reflect the economy's growth in tourism and financial services. It produced a culture that became more people oriented and contributed to a rise in infrastructure, education, social services, and health care (Cayman Islands Government 2014). Tourism, primarily aimed at U.S. tourists seeking luxury services, accounts for about 70 percent of the islands gross domestic product (GDP) (CIA 2016).

The population of the Cayman Islands is 57,268 (in July 2013), and almost half of the population lives in the capital, George Town (CIA 2016). The population is split between the sexes. Half of the Cayman population are citizens, and the remaining 49 percent are expatriates with workers coming abroad from several different countries (Cayman Islands Government 2014). Caymanians are ethnically diverse: 40 percent have a mixed ethnic heritage, 20 percent identify as black, 20 percent as white, and 20 percent as various ethnic groups from all over the world (CIA 2016). The official language is English; it is spoken by nearly 91 percent of Caymanians. Spanish and Filipino are also spoken (CIA 2016).

The majority of the population practices a religion, of which Christianity is the most strongly encouraged. The majority affiliate with the Protestant faith (67.8%), which includes several denominations, followed by Catholics (14.1%). A small fraction of the population is nonreligious. Other faiths include Baha'i, Judaism, Buddhism, Hinduism, and Islam (CIA 2016; Cayman Islands Government 2014).

The Cayman Islands is unique because it is composed of diverse ethnic groups and yet has a strong English influence. Under parliamentary democracy, the chief of state is Queen Elizabeth II (1926–), whose role is represented by the governor. The first woman governor, Helen Kilpatrick (1958–), was appointed by the Queen in September 6, 2013. Caymanians are also governed by a premier, currently, Alden McLaughlin (1961–), who follows the first woman premier, Julianna O'Connor-Connolly (1961–). The Cayman Islands has a three-tiered political system—executive, legislative, and judicial—and it has two political parties: the People's Progressive Movement and the United

Democratic Party (CIA 2016). Women currently hold positions in all the highest forms of government in the Cayman Islands (Cayman Islands Government 2014).

Overview of Women's Lives

Women's roles have come to include an increase in political representation, presence in boardrooms, and breaking traditional gender barriers to become leaders and role models for future women in previously male-oriented professions, with the goal of gender equality. Although full equality has not been achieved, the public is starting to address such issues as earned income inequality and gender-based violence. Due to the Cayman Islands' status as a territory of the United Kingdom, it is not included in the majority of UN country comparisons and rankings, such as the Human Development Index (HDI) and Gender Inequality Index (GII).

Girls and Teens

Girls and young teens aged 14 and under make up about 9 percent of Caymanians. Many face challenging issues of violence, sexual abuse, and mental health problems. In a study of 955 teens, 18 percent of girls reported being victims of sexual abuse, and 22 percent had been victims of physical abuse (Cayman Islands Government 2014). Boys join girls in feeling unsafe; 15 percent of boys do not feel safe in school. While boys face societal pressure to behave in hard-line, traditional masculine ways and to have multiple sex partners, girls are disproportionately the targets of forced sex. Twenty percent of girls reported that their first sexual encounter was forced. Issues include hunger and other problems, such as drinking, mental health problems, drug use, or violence in their homes. With this report, the government has baseline data highlighting where services need to be strengthened and where to develop targeted interventions (*Cayman News* 2015).

Sports participation is important to Caymanians, regardless of gender. The Department of Sports promotes and supports women athletes. Girls' athletic achievements are showcased during national women's month. Female athletes, coaches, and administrators are also highlighted. The goal is to show the many ways women have contributed to Caymanian culture and increased its vitality and diversity. Honoring athletic achievements also serves to increase awareness of the importance of physical activity (Cayman Islands Department of Sports 2016).

Caymanian youth are encouraged to participate in scouting, a popular activity that has become a multigenerational tradition. The 100-year-old Scout Association has about 500 members. The scouting tradition is based on religious principles and has been influential in shaping children's ethics and morals, along with life skills gained through hands-on service learning. Scouts are government funded, so all youth can participate.

Education

Education standards are comparable with the U.K. English model. The adult literacy rate shows no significant difference between the sexes; females had a literacy rate of 99 percent, while males were at 98.7 percent (PAHO 2012). Education is mandatory for every child starting from age 4 and until age 16 (Ecay Business 2014). The Cayman Islands offers free lunches to school-aged children through the Department of Children and Family Services. Nearly 1,000 students benefit from free lunches and are more than likely to come from single-parent homes. Government and privately run educational institutions offer preschool through high school as well as education for students with individual needs. Religiously based schools offer additional options (Ecay Business 2014). The Cayman Islands has a variety of private schools, specialized vocational training programs, law schools, medical schools, and other colleges, similar to schools in the United States or the United Kingdom.

Education is valued in the Cayman Islands; on average, nearly 80 percent of students 15 years and older have passed their examinations. There are slight variations in education with regard to the sexes; the 2010 Census data revealed a 3 percent difference—females are obtaining education at a slightly higher rate than males (82% versus 79%). When it comes to secondary education, females were more likely to obtain a college degree, while males were more likely to have a trade or vocational diploma or certificate. Ideas about gender and how sexuality is defined are believed to be the cause of gender disparities in education (Cayman Islands Government 2014).

Health

The government spends 20 percent of its budget on health care, even though there are a large number of Caymanians with three or more risk factors for chronic diseases (WHO STEPS 2012, 11). Despite these concerns, the average life

expectancy for women is 84 years, and for men it is 78 (CIA 2016).

Access to Health Care

Health services are provided through the Cayman government's Health Services Authority. It oversees direct primary, secondary, and tertiary health care at the George Town Hospital and specialized clinics. Caymanians, in accordance with the Health Insurance Law of 2012, must have health insurance, and employers must provide insurance to their employees and dependents living on the islands (WHO STEPS 2012, 11). Combined, the two hospitals—George Town and Faith—provide 120 hospital beds. More than 800 health professionals in both public and private practice provide care (Economics and Statistics Office 2014, 52).

Maternal Health

A majority of women have made it a choice to be married before becoming a parent. Around 65 percent of all births are to women who are married. Nearly 28 percent of births are to women who have never been married. Many women become mothers between the ages of 30 and 34; 30 percent of births occur to women in this age range, and about 22 percent of women between the ages of 24 and 29 give birth (PAHO 2012). Infant care is seen as the sole responsibility of the mother. Traditionally, women relied on their relatives for assistance when husbands were off at sea for long periods of time (Peters 2014). Now, women are expected to be the primary caregivers.

The fertility rate is 1.86 children born per woman. Based on data from public hospitals, there were 3,283 births between 2006 and 2010. On average, there are 700–800 births per year (Cayman Islands Government 2014). In 2016, the birth rate was 12.1 per 1,000 births. The infant mortality rate of 6 deaths per 1,000 live births compares favorably to many countries; it is ranked 166th best out of 225 countries (CIA 2016).

Nearly all births, 97 percent, happened at a public hospital, the remaining in a private hospital. Over a four-year period, women in general had an increase in cesarean deliveries. In 2006, 38 percent of deliveries were through caesarean, and by 2010, 41 percent were caesarean. In 2010, there were 304 births for mothers who were 18 years old or younger: 24 births for adolescents 15 and younger, 38 births for 16-year-olds, 82 for 17-year-olds, and 160 for 18-year-olds (PAHO 2012).

Diseases and Disorders

Over the years, the most common diseases have changed from communicable to noncommunicable. Obesity, diabetes, high blood pressure, stroke, and cancer are the leading causes of disease (WHO STEPS 2012, 2). Blood diseases and cancer account for 50 percent of deaths among men and 47 percent among women (Economics and Statistics Office 2014, 56). The Zika virus was reported in the summer of 2016 (CIA 2016).

Thirty-five million people throughout the world live with HIV/AIDS, and the Caribbean region has the second-highest rate, behind sub-Saharan Africa. Despite this, it is not prevalent in the islands. About 62 people live with HIV, and 72 have AIDS. Since it was first identified in the islands in 1985, there have been 123 infections, with 43 deaths. A new strain of the virus has been identified, leading public health authorities to urge Caymanians to be tested and to be vigilant about practicing safe sex (Cayman Islands Government 2015).

Employment

Adulthood responsibilities come sooner for teens in the Cayman Islands than in the United States. There is a strong work ethic on the islands; teens are expected to work by 15 and are considered outside the labor force if they are not. Ideas about gender roles have been associated with gaps in the labor force; there are a considerable number of women aged 15 and older not participating in the work force. Gender ideologies and their associated stereotypes influence the type of activities and employment deemed appropriate for men and women. For instance, the role of homemaker, jobs associated with private households, and education are predominantly fulfilled by women. This has led to discrimination in the general labor force about the expectations of women, and, consequently, there are fewer women participating in the paid economy (Cayman Islands Government 2014).

Many see the Cayman Islands as a modern country that values equality; however, women and men do not have equal opportunities. Women and men who work outside of traditional employment roles encounter both indirect and direct forms of discrimination (Cayman Islands Government 2014). For example, private households primarily employ women to perform a variety of domestic duties, such as child care, cleaning services, cooking, running errands, and so on. Women are also employed in professional sectors of education, social work, and human

health services. There are more women professionals on the islands than men; however, there are fewer women managers. Women are also frequently employed in customer service positions in the tourism and hospitality industry. Examples of structural forms of gender discrimination include employers denying women positions in male-dominated industries such as construction, skilled and unskilled farm work, trade, and energy (Cayman Islands Government 2014). Such gender-based discrimination reinforces gender roles and influences the occupations women and men pick.

The Gender Equality Law of 2011 was enacted to promote gender equality overall as well as to help stop the cycle of structural discrimination. Through education, the hope is to eliminate structural discrimination in the workplace by breaking the prejudices and stereotypes that divide gender (Cayman Islands Government 2014). To learn about and address gender-based income inequality, the Cayman Islands Economics and Statistics Office (ESO) conducted a survey of gender-based income differences. Results found men clustered in the highest pay bracket; 65.5 percent of men made \$7,200 or more a month. Women clustered in the lowest pay brackets. Of the workers earning less than \$800, 83.3 percent were women. And of those earning less than \$1,600 a month, 63.5 percent were women. Findings show that women make significantly less than their male counterparts, even in the same job (Cayman Islands Government 2014).

Expatriates

For a time, foreign work permit holders, or expatriates, were the majority of the islands' labor force and could stay and work indefinitely. However, in 2004, the Cayman Islands limited the length of stay. After a 2011 and a 2013 revised immigration law passed, the islands saw significant immigration changes. Currently, expatriates can hold a seven-year residency, in an attempt to give native Caymanians more opportunities for employment. The number of people eligible for permanent residency was also reduced. However, from 2011 to 2012, the Cayman Islands saw an increase in foreign workers rise from 19,927 to nearly 21,000 (Harper 2013). In October 2013, nearly 2,000 expatriates' visas were set to expire—nearly 10 percent of the workforce. The hope was to give the jobs to local citizens, whose unemployment rate was more than 10 percent (Sabo 2013). Promoting changes to immigration could also ease rising tension between

locals, who struggle with joblessness, and expatriates (Shelley 2013).

The Cayman Islands is among the world's 10 largest financial centers and has been known as a "tax haven" for the world's richest people because of relaxed rules in which income and capital gains are not taxed (Harper 2013). There has been pressure to bring transparency to the thousands of companies and most of the world's hedge funds that do their financial business within the Cayman Islands. This could influence the number of companies willing to leave, which could lead to a strain on the economy, specifically in the financial sector.

Family Life

Marriage is limited to monogamous, heterosexual relationships. Homosexuality has been deemed illegal by local Cayman authorities, including religious leaders. There have been ongoing tension between Great Britain and the local authorities because the monarch has sought to promote the idea of gay marriage among its territories (Peters 2014). There are a variety of households in the Cayman Islands. Single households are most commonly found in the expatriate workers. Single-parent households have become more common over the years. Traditional and extended families have seen women having more power and control within the family unit than previously (Peters 2014).

Approximately 19,000 households make up the three islands. Caymanians have the lowest rate of estimated poverty in the Commonwealth of the Caribbean, with nearly 1,000 households living below the poverty threshold. From 2006 to 2010, families receiving poverty relief assistance increased from 915 to 968. In a survey administered by the Economics and Statistics Office, it was found that 1.9 percent of the population fell below the annual poverty threshold, 3.7 percent of the population lived in households that were considered vulnerable to poverty, and 3.1 percent of households were below the vulnerable line (Cayman Islands National Assessment of Living Conditions 2008). Households with an annual income of \$3,983 (USD\$4,857) or less are considered to be in the poverty threshold. Those with an annual income of less than \$4,979 (USD\$6,072) are considered "vulnerable" and at risk of not meeting their daily consumption needs. In 2007, females headed nearly half of poor households—49.5 percent (PAHO 2012). Women who are the breadwinners for their families are more likely to be the poorest, and they account for nearly half of poor households in the Cayman Islands.

Same-Sex Unions

Same-sex couples may enter into civil partnerships, but they are currently denied full marriage and all the benefits that confers. Although religious and cultural beliefs hinder the legalization of marriage, the Cayman Islands Human Rights Commission has called the Cayman government to modify its constitution, which sanctions marriage for heterosexual couples only. By not doing so, it risks being in breach of the European Convention on Human Rights (Stowe 2015).

Politics

In addition to the governor and premier, the government includes a six-member cabinet selected from the Legislative Assembly and appointed by the governor with input from the premier. Twenty seats comprise the assembly, 18 of which are directly elected by majority vote. Speaker of the House Julianna O'Connor-Connolly and Tara Rivers, the minister for education, employment, and gender affairs, are the only women holding elected assembly positions. The deputy governor and attorney general also serve on the assembly; they are appointed by the governor and serve *ex officio* (CIA 2016). Assembly members serve four-year terms. The voting age is 18, and all citizens are eligible to vote.

Women serving in high-level government positions dates to the 1990s, when Sybil McLaughlin (1928–), an expat from the United States, served as minister of education. Her rise through the ranks is notable. She started as a legislative clerk in the 1960s (Worldwide Guide to Women in Leadership 2015). Ultimately, she was recognized as a national hero for her service to Parliament and the Cayman community (Trumbach 2016).

History of Women Rights

Women were initially accepted in the political realm shortly after World War II (Peters 2014); they won suffrage and the right to vote in 1944 (Worldwide Guide to Women in Leadership 2015). Women's representation in politics has continued to grow, despite the discrimination they have faced over time. Even though women actively participate in politics, they are still underrepresented in government. Advocates came together with the goal of empowering women by initiating the Gender Equality Law, enacted in 2011. The law's intent is to prevent discrimination because of gender, sex, marital status, or pregnancy

and to promote equality in the workplace. It prohibits discriminatory acts, practices, and policies (Cayman Islands Government 2014).

The movement for the Gender Equality Law started when the Legislative Assembly accepted the Cayman Islands Policy on Gender Equity and Equality. In 2004, the government communicated to the Foreign and Commonwealth Office (FCO) that they wanted to adopt the Convention on the Elimination of All Forms of Discrimination against Women (CEDAW) through the United Kingdom and have it carried out in the Cayman Islands. The FCO responded that local legislation was needed before CEDAW could be enacted, a two-year process. After its enactment, Parliament granted the Legislative Assembly the authority to implement legislative research to inform draft legislation addressing gender discrimination because of CEDAW. Completed in 2009, the cabinet shortly thereafter approved the release of a draft, the Prevention of Gender Discrimination Bill 2010, to the public. The public highly supported the draft, and on September 14, 2011, the Gender Equality Bill, 2011, passed unanimously. The law was officially implemented on January 31, 2012 (Cayman Islands Government 2014).

In 2014, the National Conference on Women sought to address the political, cultural, social, and economic challenges women and girls of the islands face. The conference raised awareness about their rights under the Gender Equality Law. Under CEDAW, the lives of women and girls are beginning to change for the better. CEDAW's agenda involved gathering data, with a goal of establishing a list of the most detrimental of issues facing women and girls, such as gender-based income inequality and gender-based violence. The conference additionally sought to "educate, inspire and empower girls and women to be 'Architects of Change'" in society, as well as in their own lives (Cayman Islands Government 2014).

Honoring Women Month

Women are given the chance to participate in events that specifically seek to "encourage and inspire growth and change in all areas" of their lives. International Women's Day (IWD) is a way for the islands to come together and celebrate women's social, political, and economic achievements and focus attention on areas in need of additional action and support. Public and private sectors unite during the IWD expo, which offers free classes, demonstrations, and access to information regarding resources from

government agencies, businesses, religious nonprofits, and community organizations. The goal of the IWD expo is to provide girls and women the opportunity to focus on self-care with the hope of motivating change from within (Cayman Islands Government 2014).

National Heroes Day

In 1993, the National Heroes Law was passed by the Legislative Assembly to honor individuals who have done exceptional work for the community. One outstanding civil servant, Sybil Joyce Hylton (1913–2006), was committed to assisting Caymanian youth for over half her life. In 1963, she became the islands only probation officer. She was the first person to lead the country's Probation and Welfare Department up until 1982. Her role in the community helped her lobby the government to meet resolutions addressing inequalities faced by young people, especially as they entered the judicial system. For example, she stressed the need for a separate court for juveniles. She is also credited for helping to develop the scouting movement (Cayman Islands Government 2014). Of eight national heroes, three are women. Hylton and McLaughlin are joined by Mary Evelyn Wood (1900–1978), a politician and nurse who was the first woman elected to the Legislative Assembly.

Religion and Culture

While religion is very important to Caymanians, women's access to leadership roles is restricted, and there is resistance allowing women to enter these roles. Positions of authority have been reserved for males, and a majority of the church leaders are men (Peters 2014). Even though women make up the majority in the congregations, men maintain the positions of power.

This is counter to the traditionally matriarchal society where women played key roles in the family, business, and government while men left for sea fishing and other industries, such as working as shipbuilders, fishermen, and sailors. In 1906, more than one-fifth of the population of around 5,000 was estimated to be at sea (Cayman Islands Government 2014). Women were left to head the family, care for children, and maintain the house.

At one time, Caymanian women were the wives of sea turtle fishers, so it is fitting that the national dish is turtle. Cooking has always been associated with women, and the unique Caymanian cooking style is similar to Caribbean jerk (Peters 2014).

Issues

Domestic Violence

The Cayman Islands has worked to address domestic and sexual abuse, which are human rights violations, through the passage of the Protection from Domestic Violence Law 2010. Broadening the definition of domestic violence expanded what and who is covered, such as by including people in visiting relationships and children. Women can also find support through the Cayman Islands Crisis Centre, which was created to perform outreach to women and children affected by domestic or sexual abuse. The center has helped more than 700 women since its beginning by providing a safe house and other services. The safe house provides a range of services, including housing, counseling, classes promoting healthy lifestyles, workshops supporting clients' transitions toward a life free from violence, and work placement programs. In 2009, the center received funding from Hedge Funds Care Cayman to train over 25 facilitators to recognize and address domestic and sexual abuse. In addition, more people completed the Darkness to Light program, to raise awareness of child sexual abuse (Cayman Islands Crisis Centre 2014).

Sex Trafficking

Human trafficking is considered to be a form of slavery because it involves victims who are sexually exploited or forced into labor. It is estimated that 12.3 million women, men, and children worldwide are enslaved. It is an issue that also reaches the Cayman Islands (CIA 2014). According to *Newsmax*, in 2013, law enforcement authorities from 230 U.S. federal, state, and local Cayman Islands agencies implemented operation Cross Country to combat sex trafficking. This operation uncovered one of the largest child sex-trafficking crackdowns at the time and saved 105 girls and boys from their captors. Law enforcement arrested 150 individuals involved during the three-day effort (Mattingly 2013).

Chile

Overview of Country

The Republic of Chile, situated on the western seaboard of South America, is bordered on the north by Peru and Bolivia, on the east by Argentina, and on the west by the Pacific Ocean. Chile's present borders were set after the War of the Pacific (1879–1883), when it expanded by annexing the bordering regions of Peru and Bolivia that contain valuable mineral resources. Chile is a long and narrow country, spanning about 2,700 miles from north

to south but only 110 miles from east to west. The Andes mountain range runs north to south across most of South America, creating a natural border between Argentina and Chile. Chile can be divided into three zones: the northern dry zone of the Atacama Desert with mining resources; the central zone, which is often compared to the Mediterranean and is the country's main agricultural region; and the southern Patagonian region, which is known for its yearlong rainfall. Today's population is approximately 17.5 million; the population of the Santiago metropolitan area, the nation's capital, is approximately 6.8 million (CIA 2017).

When Spaniards arrived in the region in the 1530s, there were more than 500,000 primarily semisedentary peoples, including Atacameños, Diaguitas, Picunches, Araucanians (also called Mapuches), Huilliches, Pehuenches, Cuncos, and others. The Spaniards consolidated their conquest of the region in the 1550s, but because the area did not have precious metals or large sedentary populations, it remained part of the periphery of the Spanish Empire in the Americas. By 1600, indigenous peoples occupied the region alongside approximately 5,000 Spaniards and a small number of enslaved Africans. Throughout the colonial era, the region, especially central Chile, focused on agricultural production. Large estates produced for Chilean and South American markets, including exports to

Women's Voices

Michelle Bachelet

Born in 1951 to a father who was arrested, tortured, and murdered by the brutal Chilean dictator Augusto Pinochet, Michelle Bachelet was herself arrested, tortured, and exiled. Bachelet earned her medical degree and became a pediatrician. She then returned to Chile after Pinochet's ouster and became the country's first woman president in 2006. Her leadership helped Chile avoid the worst of the global economic crisis. When she left office, a right-wing administration took over, and so Bachelet decided to run again. She explained, "I am going to work to lead the next government: the first government of the new political and social majority that allows us to confront inequality and build a more inclusive Chile" (Bachelet 2016). She was reelected by a landslide in 2013. In 2016, Forbes ranked her 18th on its list of the world's 100 most powerful women.

Lima, Peru. By the turn of the 19th century, Chile's population was approximately 500,000, consisting primarily of mestizos, Creoles, and Spaniards; this estimate does not include the indigenous peoples. Under the military leadership of Bernardo O'Higgins and José de San Martín, Chile liberated itself from Spain in 1818 (CIA 2017).

Colonial legacies continue to influence modern Chile. While there are still some independent indigenous groups (e.g., Mapuches), Chile is primarily mestizo today, a blend of Spanish and indigenous peoples, along with a small number of Eastern Europeans who migrated in the late 19th century. Catholicism was introduced by the Spaniards in the colonial era, and it predominates, though Protestantism has made some inroads. Despite industrialization in the 20th century, Chile primarily remains a raw material and agricultural producer. In the 19th century, nitrates were the leading export, and in the 20th century, copper predominated. In recent decades, there has been an increase in agricultural exports. Like most other former colonies of Spain in the Americas, Chile adopted a presidential republican system of government after independence. With its multiple parties ranging from rightist to leftist, Chile has a strong democratic tradition, despite the fact that from 1973 to 1990 Chile had a military dictatorship headed by Augusto Pinochet, who came to power after the democratically elected socialist president Salvador Allende was removed by a military coup.

While men dominate Chile's economic and political fronts, Chilean women have made significant gains since the country's return to democracy in 1990 (CIA 2017). Gains are reflected in its 2014 Gender Inequality Index (GII) ranking of 42nd out of 188 countries, placing it in the very high in the human development category (UNDP 2014).

Girls and Teens

Gender Stereotypes

In 2015, Chile's El Servicio Nacional de la Mujer (National Women's Ministry, hereafter SERNAM) began efforts to challenge and eradicate negative gender stereotypes that might influence young Chileans' academic and personal development. One stereotype SERNAM has addressed is the idea that mathematics, science, and technology are male-oriented fields. SERNAM asserts that girls who experience this particular stereotype lose confidence in their abilities to succeed in these disciplines and are therefore

less likely to pursue related degrees and careers (SERNAM 2015c). Research has shown that while more women enroll in university programs than men, few women pursue degrees in mathematics, science, and technology. For example, in 2014, only 20 percent of students who registered for technology-oriented programs were women. That same year, women accounted for just 24 percent of first-year students in engineering programs. In an effort to reverse this trend and to bolster young girls' self-esteem, SERNAM launched a viral campaign *Postular Por Tus Sueños* (Reach for Your Dreams). The campaign highlights young women who have enrolled in male-dominated academic programs, such as engineering, and offers them an outlet to tell their personal stories and to encourage other girls to pursue their academic and professional dreams (SERNAM 2015e). In addition, SERNAM has challenged textbooks and other school materials that reinforce stereotypical roles for women, such as maternity and domestic responsibilities, and that ignore women's professional accomplishments and capabilities (SERNAM 2015c). SERNAM hopes to not only remove these stereotypes from schools but also aspires to incorporate positive gender identities into Chile's educational system, which promotes respect and equality.

Teen Pregnancy

Chile's rate of teenage pregnancy has not fluctuated significantly in the past two decades. Whereas 50 out of every 1,000 Chilean girls ages 15–19 gave birth from 1996 to 2000, the number of adolescent births among the same age group decreased to 48 out of every 1,000 girls from 2011 to 2015 (World Bank 2016a). In terms of total births, Chile's national women's ministry reported that, in 2009, adolescent mothers accounted for 16.2 percent of all live births, 4.68 percent of which were delivered by girls aged 10–14. Although the educational system legally prohibits discrimination against pregnant students, research shows that pregnant students are significantly less likely to continue their education than male students who are fathers. In 2009, approximately 39,240 women aged 10–19 were unable to attend school due to pregnancy or maternity, while just 1,980 male students were forced to leave their studies due to paternal responsibilities (SERNAM 2012).

Adolescent mothers also have a lower likelihood of obtaining employment. According to SERNAM, only 12.2 percent of adolescent mothers enter Chile's paid workforce.

Nearly 65 percent of teen mothers are part of the nation's two lowest economic groups, and low employment rates suggest that many of these girls will be unable to improve their economic status and thus will remain economically vulnerable (SERNAM 2012). Government efforts to reduce teen pregnancy through state-sponsored sexual education programs have been substantially limited by social opposition.

Sexual Education

State-sponsored sexual education programs have been visibly absent from Chilean schools throughout the past two decades due in large part to social opposition. The Catholic Church and other conservative sectors of society have consistently challenged sexual education initiatives, believing that these programs encourage youth to engage in premarital sex (Casas and Ahumada 2009, 90–91). Due to both the church's relative success in prohibiting sexual education in the public school curriculum and the highly controversial nature of open discourses on sexuality, young Chileans have limited access to accurate information about sexuality. In 2010, Congress took action by approving a reproductive education law that guarantees knowledge and access to contraception in schools and health centers across the country (Stevenson 2012). Nevertheless, sexual education programs remain inadequate, and the UN Convention on the Rights of the Child protocols go unenforced (UNCRC 2015).

While change has been limited, there has recently been a greater push for change. Since her return to the presidential office in 2014, Michelle Bachelet has called for the implementation of secular sexual education programs, something Chile's national women's ministry describes as an important step in reinforcing women's autonomy (SERNAM 2014a). In 2015, SERNAM undertook the creation of the Programa Buen Vivir de la Sexualidad y la Reproducción (Program of Healthy Sexuality and Reproduction) to support Bachelet's push. The program was created to provide women, as well as adolescent girls and boys, with a safe and mature setting in which they can learn about and discuss their sexual and reproductive rights (SERNAM 2015a). Other topics such as safe sexual practices, sexual assault, and sexuality in general are also discussed. SERNAM reported that throughout the program's first year, workshops were conducted in dozens of counties across Chile, reaching thousands of young Chileans and women (2015a).

Education

While gender inequality is prevalent in Chile's political, professional, and domestic spheres, women have fared relatively well in their educational system. As of 2015, 97.5 percent of Chileans over the age of 15 were literate (CIA 2017). In terms of school enrollment, Chile established gender parity in primary and secondary education as early as 1990 and has successfully maintained this balance through today (World Bank 2016b). Tertiary enrollment rates have also been relatively even for men and women throughout the postdictatorship era. However, in the past decade, slightly more women have pursued higher-level education than men (World Bank 2016c). Furthermore, as of 2013, the expected graduation rate for first-time university students was higher for women than men (Ministerio de Educación 2015, 6).

This is an important development for women, as there is a clear correlation between educational success and the level of female participation in the labor force (SERNAM 2014b). According to a 2011 study, women with a basic level of education and those with a midlevel amount of education were 36.9 percent and 53.7 percent, respectively, whereas women who had completed some form of higher level education were employed at 78.6 percent (18). These figures underscore gender discrimination for those with limited education. Chile's Ministry of Education reported that, in 2011, men who had a basic level of education had an employment rate 40 percent higher than women with the same degree of education.

In contrast, gender parity is not as apparent for those with advanced degrees; there was only a 3 percent employment gap in favor of men for Chileans who had completed a postgraduate degree (Ministerio de Educación 2015, 6). However, women with advanced degrees make on average 62 percent of what their male counterparts earn, while women who only completed a basic level of education make 77 percent of what their male counterparts earn (7).

Health

Chile's National Health Services System administers the country's public health system through its 29 offices and its network of hospitals and other centers. Local communities and cities provide primary care for the most part (PAHO 2012).

Access to Health Care

The UN Committee on the Rights of the Child's (UNCRC) 2015 report urged increased health care provisions for women and children. From environmental health dangers posed by lax business regulation to forced sterilization of mentally disabled girls, the United Nations recognized much room for improvement for women's health. Mental health is an area where care is particularly lacking for women and children. Domestic abuse has a direct effect on women's mental health. Both verbal and physical abuse are highly connected to indicators of psychological distress. Women who report more verbal and physical aggression are more likely to display greater depressive affect and symptoms of posttraumatic stress disorder (PTSD). Women of low socioeconomic status are at greater risk of suffering domestic violence and poor mental health due to the associated negative stress of living in poverty (Ceballos et al. 2004). Poverty has broader negative consequences for women's health. The difference in quality between private and public health care is detrimental to women's health, owing to the disproportionate number of women versus men living in poverty.

Maternal Health

Another positive development is that maternal mortality has fallen significantly since 1970. As of 2008, the maternal mortality rate was 19.8 deaths per 100,000 live births (PAHO 2012). The implementation of maternal health policies in 1965, increasing rates of women's educational attainment, and rising proportions of deliveries by skilled birth attendants have been important factors in the decrease of maternal mortality.

Diseases and Disorders

A specific health problem in Chile that disproportionately affects unemployed and poorly educated young housewives living in poverty is the HIV epidemic. An estimated 15 percent of all HIV-positive people in Chile are women, who in most cases have contracted the disease through sexual contact with their husbands or other male partners (Cianelli et al. 2013; Cianelli et al. 2008).

Despite challenges, there have been some advances in women's health. Chile has a well-organized screening program for cervical cancer, the second most common cancer in women in Latin America. Between 1990 and 2004, Pap smear testing increased 162 percent. Additionally, cervical

cancer mortality decreased 48 percent between 1987 and 2003 (Gomez et al. 2014).

Employment

When Chile transitioned to democracy in 1990, there was not only a stark contrast between male and female employment within the nation, but also between the percentage of Chilean women in the workforce compared to other Latin American countries. Whereas 73.6 percent of men were employed in Chile in 1990, only 32.5 percent of women were active in the nation's workforce. This was noticeably lower than the regional average of female employment in Latin America, which stood at 49.2 percent (SERNAM 2014b, 13). Since then, Chile has seen female employment rise, but it has failed to both match regional trends and establish an equal balance between male and female workers. In 2000, 39.8 percent of women were employed in Chile compared to 73.4 percent of men (15). By 2011, male employment dropped to 70.1 percent, while female employment rose to 43.5 percent. Yet, despite its marked growth, Chile was still below the Latin American average of 52.6 percent (13).

Today, these contrasts are still evident. Less than half of Chilean women were employed in 2014, whereas male employment remained above 70 percent. The Latin American average for female employment remained at approximately 52 percent (SERNAM 2014c). Further contrasts are apparent in the makeup of Chile's female labor force. In 2011, 75.4 percent of women from Chile's highest economic income group were active in the nation's workforce, whereas only 35.6 percent of women from Chile's lowest economic income group were engaged in paid labor (SERNAM 2014b, 16). The employment gap between Chile's richest and poorest women stood at 38.9 percent in 1990, a figure that closed by only 0.5 percent by 2011 (16). These figures demonstrate that while the rate of female employment has noticeably increased since the return of democracy, Chile has neither met the regional standard for female employment nor has it seen a pronounced diversification of the women who participate in the labor force in terms of economic income.

Unpaid domestic responsibilities, along with a number of cultural issues, hinder women from obtaining employment. Women are, and always have been, responsible for the overwhelming majority of domestic tasks. A 2014 SERNAM report found that women are responsible for 71.5 percent of unpaid domestic work, such as raising children,

cooking, cleaning, and taking care of elderly and sick family members (11). These household responsibilities dominate many women's lives to such an extreme extent that they are often forced to set aside their careers and studies to dedicate their time to unpaid domestic labor. A government survey found that, in 2013, 1,366,200 women were unable to engage in paid labor because of their unpaid domestic responsibilities. More specifically, approximately 30 percent of Chile's unemployed women stated that housework prevents them from entering the job market, while an additional 9.6 percent asserted that their role as caregivers hinders their professional careers (19). This reality, which predominately affects economically disadvantaged women, not only creates an unbalanced workforce in terms of gender, but it also leaves women with a sense of personal dissatisfaction and promotes a societal perception that women cannot succeed in the business world (10).

The UN Committee on the Elimination of Discrimination against Women (CEDAW) 2012 report expressed concern about the emphasis placed on traditional gender roles for men and women, particularly those that continue to stereotype women as mothers and wives to the detriment of their education and career options. Steps are being taken to relieve women of domestic responsibilities so they can enter the workforce, such as the Chile Crece Contigo (Chile Grows with You) program, under which the number of public nurseries has grown by 240 percent since 1990 (SIGI 2014, 8).

The nature of employment available to women also shows the extent of gender discrimination they face. In Chile, the hiring preferences of employers and those who have established control of the nation's resources, in addition to long-standing social perceptions about the types of employment in which women should engage, significantly impact the types of work in which women can engage (SERNAM 2014b, 12). These prejudices led to the feminization of many jobs in the public sector, such as social and health services and teaching positions, while the nation's leading private industries, such as construction, transportation, agriculture, and manufacturing, remain male dominated.

This broad gender segregation is long established within Chile's job markets and is a cause of concern. As of 2011, women accounted for 93.2 percent of paid domestic workers, 53.1 percent of paid public employees, 38.5 percent of independent workers, and only 34.4 percent of

private-sector employees (22). These figures reflect a public sector that offers very good working conditions and the highest wages and that is fairly open to women. The total number of public employees, however, is relatively small. The private job sector is far larger than the public sector and typically offers the second-highest wages, but it has a very low female presence (22). Finally, paid domestic labor, a market notorious for low wages and bad working conditions, is made up almost entirely of women. While some women have secured high-quality employment, women in general are still confronted by limited employment opportunities. The nature of work available to women is considered so restrictive that, in 2014, Chile was ranked 119th out of 142 countries in the World Economic Forum's category of "Economic Participation and Opportunity" (World Economic Forum 2014).

Women's ability to achieve economic independence and equality is further undermined by low wages and limited access to positions of leadership. On average, women make 32.3 percent less than their male counterparts, despite governmental efforts to enforce equal pay (SERNAM 2014a). Chile's pay gap is so egregious that, in 2014, it was ranked 128th out of 142 countries in terms of wage equality for similar work (World Economic Forum 2014). Similarly, women are noticeably absent from managerial positions in Chile's labor market. There are 10 times as many men as women in upper-management positions, and there are only 7 women for every 100 men who serve as the directors of companies (SERNAM 2014c).

While Chile's pay gap can in large part be explained by the unfounded societal perception that work carried out by women is less valuable or less productive than work undertaken by men, Chilean women's inability to regularly secure positions of leadership in the job market has much to do with the hypothetical and tangible limitations resulting from unpaid domestic responsibilities. Many women are unable to attain high-level positions because of the belief that, as mothers, they do not have time for demanding jobs. Others are unable to do so because they must interrupt their careers to tend to familial needs, and, therefore, they have limited job experience (SERNAM 2014b, 10). These examples are representative of a broad collection of social biases that prevent women from achieving positions of power, and they reemphasize that until there is a legitimate redistribution of domestic responsibilities between men and women, true gender equality will not exist in the Chilean workforce.

Family Life

Attitudes about women's role in the family are divided but slowly changing. A 2003 poll found that 69 percent of Chileans agreed with this statement: "Having a job is fine, but what most women really want is a house and children" (Power 2004). The percentage of Chilean women who work continues to increase, even though they work outside the home less than almost all of their Latin American counterparts (Fort et al. 2007). Along with conflicting attitudes, there are contradictions in family law that place women in a subordinate position. The Chilean Constitution states that men and women are equal under the law, but the Civil Code recognizes men as heads of the household. This means that when both parents live together, the father is the sole legal parental authority, rather than being jointly held. Further, in marriage, the husband holds the legal power to administer family assets (SIGI 2014, 1).

Younger women are increasingly choosing cohabitation over marriage (Stange and Oyster 2011). Along with cohabitation, single-parent households are another option since divorce became legal in 2004. Men and women may initiate a divorce. Marital assets are equally divided between partners, and compensation is given to the partner who carried out the majority of the child care duties, which tends to benefit mothers. Reforms in the 2008 pension system law (Law 20255) also had positive outcomes for women, especially mothers and female divorcées. The law provides for pensions to those who have not earned pension savings through a pension-earning job, allows extra savings for children, and enables the use of pension savings as part of a divorce package (SIGI 2014, 3).

Politics

Women in Congress

Female participation in the Chilean government has been extremely limited since the nation's return to democracy. While Michelle Bachelet's presidential victories in 2006 and 2014 may give the impression that women play a dominant role in the political system, nearly every branch of the Chilean government remains male dominated. This is, and always has been, especially true in the case of the Chilean legislature. At no point since 1990 have women made up at least 30 percent of the total members of Congress, a percentage that is typically recognized by UN Women as an important benchmark for female representatives.

The combined percentage of women holding seats in both the Chamber of Deputies and the Senate has consistently been much lower than this standard (UN Women 2016). From 1990 to 1993, only 7 of 120 deputies and just 2 of 38 senators were women. The 1998–2001 congressional term saw a modest increase; the number of female deputies rose to 14, while the number of female senators remained unchanged.

Following the 2010 elections, 17 women held seats in the lower house of Congress, and 5 women held seats in the Senate (Hinojosa and Franceschet 2012, 760). Current numbers remain low. As of 2014, there were just 19 female deputies and 6 female senators in the Chilean legislature (SERNAM 2014c). During 24 years of democracy, the percentage of female legislators rose from 6 percent to 15.83 percent in the Chamber of Deputies and from 5 percent to 15.79 percent in the Senate (SERNAM 2014c). While these figures alone show the absence of gender parity in the Chilean legislature and the slow rate of women's inclusion, when compared on an international level, Chile's low female representation in the legislature becomes an even greater cause of concern. In 2014, Chile was ranked 90th out of 142 countries in terms of female legislators (World Economic Forum 2014). From a regional perspective, Chile has not fared much better. Not only was the average rate of female parliamentarians in the Americas 25.5 percent in 2015, but 9 Latin American nations had lower houses of parliament with more than 30 percent of women members (UN Women 2016).

Chilean women, however, are poised to play a greater role in both houses of Congress. In 2015, the Chilean government announced that it would incorporate gender quotas into the national legislature. Beginning in 2017, neither men nor women will be allowed to make up more than 60 percent of a political party's congressional candidates. This gender quota, which is to remain in place through the 2029 congressional election, will likely boost female participation in the legislature by a considerable degree (UN Women 2016).

El Servicio Nacional de la Mujer (SERNAM)

In 1991, the legislature passed a bill that created SERNAM, a national women's ministry specifically designed to work with the executive branch to identify and combat gender inequality in Chile. Despite SERNAM not being an independent ministry and instead a part of the Ministry of

Planning and Cooperation, SERNAM's director does hold ministerial ranking and is therefore able to participate in cabinet meetings (Franceschet 2003, 21). Furthermore, as it is part of the executive branch, members of SERNAM are able to draft legislation (18). These two features are significant. The former enables SERNAM's director to ensure that gender issues are a national priority, while the latter allows SERNAM to create and recommend legislation that can empower women and strengthen gender parity.

Historically, SERNAM concentrated its attention on preventing domestic violence and teen pregnancy, promoting female employment and fair labor standards, and drafting legislation and policies designed to empower women in all sectors of society. Unlike other women's state agencies in Latin America, SERNAM has not experienced significant institutional changes; thus, it has been able to carry out its agenda in a relatively consistent manner (36). This consistency has earned SERNAM a reputation as one of the most effective women's ministries in Latin America.

Despite its regional prominence, SERNAM has received criticism. Critics charge the agency could have created greater gender equality and taken a more hard-line stance. Whether these criticisms are warranted, SERNAM has struggled to ensure that successive administrations take action to improve women's rights and opportunities. Despite this, SERNAM has proven itself to be a key agent in Chile's struggle for gender parity (Franceschet 2003).

Michelle Bachelet

Despite the fact that men continue to dominate politics, one female politician, Michelle Bachelet, has experienced unprecedented success as Chile's president. A doctor by profession, Bachelet won her first presidential election in 2006 as a socialist candidate for the Coalition of Parties for Democracy (CPD), making her the first woman to fill Chile's presidential office. From the perspective of gender, Bachelet's first term was largely characterized by her decision to appoint women to half of her cabinet positions and by the unusually high number of gender-related proposals introduced in the national legislature (Steven-son 2012, 132). From 2006 to 2009 alone, 167 gender bills were brought before Congress, an astonishing increase compared to the 42 introduced during her predecessor's tenure (134). Specifically, Bachelet focused her attention on providing free day care services, strengthening the nation's campaign against gender-based violence, improving fair labor standards, and expanding women's rights to

emergency contraception. Following the completion of her first term, Bachelet served as the director of the UN Entity for Gender Equality and the Empowerment of Women (commonly referred to as the UN Women agency) for approximately two and a half years.

In 2013 Bachelet ran for a second presidential term and defeated the center-right candidate Evelyn Matthei. The 2013 election marked the first time in the nation's history that both primary candidates were women, and it was also memorable because Bachelet's victory made her the first person to win multiple presidential elections in the postdictatorship era. Since her return to power in 2014, Bachelet has overseen the institution of gender quotas in the national legislature and has demonstrated a firm commitment to expanding women's reproductive rights.

Furthermore, Bachelet played a key role in the creation of a second national women's ministry, El Ministerio de la Mujer y la Equidad de Género (Women and Gender Equality Ministry). Signed into law in March 2014, this ministry was established to strengthen the state's ability to address and eradicate gender inequality through improved inter-departmental coordination (SERNAM 2014c). In many ways, the creation of the ministry is an acknowledgment by Bachelet's government that new and increased efforts need to be undertaken to ensure that women enjoy the same rights and opportunities as men. As of 2017, Bachelet appointed Claudia Pascual, formerly of SERNAM, as its prime minister. In addition to her gender initiatives, Bachelet has also focused attention on improving the quality of Chile's educational system, reducing wealth inequality, and reforming the nation's constitution (SERNAM 2014c).

Religious and Cultural Roles

Chile, like the rest of Latin America, is predominantly Catholic, resulting from the strong presence of the Catholic Church during the colonization era. According to one calculation, 66.7 percent of Chileans identify as Catholic, 16.4 percent are Protestants (primarily Pentecostals), and 11.5 percent do not adhere to any religion (CIA 2017). Some Amerindians practice a syncretic religion that blends Catholicism with their traditional beliefs, and others adhere more closely to their indigenous religious traditions.

Historically, the Catholic Church played a significant role in spiritual matters and in national culture and politics. The church's resistance to the Pinochet dictatorship enhanced its prestige, setting the stage for its increased

influence in the postdictatorship era. Despite constitutional freedom of religion and the fact that attitudes in Chile are becoming more accepting of liberal and profeminist agendas, the church has blocked progressive change. Revealing the church's waning influence on social mores, only 34 percent of the population regularly attends church. At 27 percent, attendance for young Chileans is even lower (Power 2004). The public generally accepts the use of contraceptives, sex outside of marriage, abortion, and divorce. Nevertheless, the church's conservative social agenda and efforts to influence politics have limited noteworthy gains (Haas 2010).

Issues

Abortion

Chile is one of six countries in the world that prohibits abortion in all circumstances, including when the mother's life is at risk (Chakrabarti 2016). This measure has been in place since 1989, when Augusto Pinochet's military junta criminalized therapeutic abortion prior to leaving power. Since then, efforts to decriminalize abortion have made no tangible progress. The status quo on abortion remains unchanged due in large part to the presence of staunch pro-life groups. A significant percentage of Chile's politicians and media consider absolute prohibition to be the only acceptable position on abortion (Haas 2010, 121). Additionally, the Catholic Church in Chile regularly uses the weight of its social influence to hinder reform.

While the existence of such considerable opposition has successfully suppressed all legislative reforms on abortion (most notably bills introduced in 1991, 2001, and 2006–2007), women have not been deterred from seeking clandestine abortions. Whereas more than 4 million clandestine abortions are believed to be carried out across Latin America every year, it is estimated that 120,000–175,000 abortions are performed each year in Chile (Blofield 2008, 399). Research also indicates that in Chile as well as in Argentina and Uruguay, “one abortion is performed for every two to three live births” (405).

Because Chilean women are unable to receive abortions from medical professionals, they are forced to find alternative ways to terminate unwanted pregnancies. Economic factors in large part dictate possible alternatives. While economically secure women are able to pay for safe procedures or travel abroad to have an abortion performed, low-income women often turn to unqualified individuals to terminate their pregnancies. This trend has

become one of Chile's most serious national health issues. Not only are an alarmingly high number of women (typically from low economic groups) hospitalized every year due to abortion-related injuries, abortion complications are also the leading cause of maternal mortality in Chile (405). Furthermore, as low-income women run a greater risk of needing medical treatment following their abortions, they inherently are more likely to face legal repercussions for illegally terminating their pregnancies. The increased physical and legal risks that low-income women are exposed to illustrate that abortion is both a woman's issue and a class issue (409).

As recently as 2015, legislation was yet again introduced to reform Chile's abortion laws. Rather than proposing a total liberalization of abortion, current efforts focus on decriminalizing abortion in three specific circumstances: when the life of the mother is at risk, when the pregnancy is a result of rape, and when the fetus is badly deformed (SERNAM 2015b). Chile's national women's ministry, a firm advocate of abortion reform, reported that more than 70 percent of Chileans agreed that abortion should be permitted in the above stated circumstances (SERNAM 2015b). Despite such popular support, it is unclear whether the legislature will grant women greater reproductive freedoms in the immediate future, and it is likely that abortion will remain one of the most socially divisive issues in Chilean society.

Domestic Violence

The prevalence of gender-based violence (GBV) is a long-standing problem in Chilean culture. The earliest published report on the subject found that, as of 1992, GBV occurred in one-third of Chilean homes (UNDP 2014). Two years later, following the emergence of a widespread social campaign against GBV, the Chilean government legally recognized the existence of domestic violence and created specific punishments for it through the creation of the Intrafamily Violence Law (Law 19.325). The effectiveness of this law was regularly questioned, and many critics asserted that it failed to protect women from their male abusers. Specifically, the law was criticized for requiring couples to attempt reconciliation through counseling, a stipulation that gave the impression that the state cared more about maintaining the family unit than imprisoning male abusers (Franceschet 2010, 9).

In the years that followed, Chile strengthened its commitment to eradicating GBV. It ratified the 1994

Inter-American Convention on the Prevention, Punishment, and Eradication of Violence against Women, which provided Chile with a useful international framework for its own domestic violence policies. In 2005, it passed what is widely considered an improved domestic violence law. The implementation of the 2005 law, La Ley 29.066 de Violencia Intrafamiliar (domestic violence law), was an important achievement as it added “habitual mistreatment” to the Chilean criminal code’s list of punishable offenses, and it demonstrated a clearer state commitment toward punishing abusers and protecting victims than its predecessor (10). SERNAM aided the successful implementation of the 2005 domestic violence law, which, since its creation, has been one of the most important change agents in Chile’s campaign against GBV (17).

Among its many roles, SERNAM has consistently gathered information on violence against women and brought it to the public’s attention. It has supplied women with pertinent information on domestic violence, and it has offered survivors safe shelters and legal resources. To date, SERNAM operates 35 safe shelters across Chile that provide temporary refuge for women and the children of women who feel threatened by an abusive male figure. In addition to being offered refuge, women are also provided with free legal, social, and psychological services in an effort to protect them from future abuse (SERNAM 2015d). Since her return to office in 2014, Michelle Bachelet has pledged to build 25 new safe houses in Chile, 11 of which have already been completed (SERNAM 2016).

The Chilean government has also undertaken efforts directed at curbing the nation’s high rate of gender-based murder. In 2010, the government modified its penal code and established severe sentences for femicide, the murder of a current or former female partner. It is questionable whether the implementation of Chile’s femicide and domestic violence laws has produced the results legislators hoped for. SERNAM has not only noted that dozens of femicides are committed each year, but it has also reported that one out of three Chilean women are still victims of some form of GBV (SERNAM 2014c). The persistence of these crimes demonstrates the extent to which machismo is still firmly entrenched in Chilean society despite government campaigns to eradicate it.

LGBTQ Community

Chile’s LGBTQ community celebrates itself and its movement with a Marcha del Orgullo Gay (Gay Pride Parade) in

June. The parade is organized by El Movimiento de Integración y Liberación Homosexual (Movement for Homosexual Integration and Liberation) (MOVILH), the oldest organization dedicated to advancing LGBTQ rights, and has recently expanded the parade into Gay Parade Chile, Open Mind Fest, featuring music, film, and the promotion of a love for diversity (MOVILH 2016).

In 2016, the Chilean Congress legalized same-sex unions, and President Bachelet expressed her plans to introduce a bill legalizing marriage. If passed, same-sex couples would have access to benefits such as state life insurance and clear pathways for adoption (Reuters 2016).

Indigenous Women

Estimates of the size of Chile’s indigenous population vary, ranging from about 7.5 percent to 11 percent of the nation’s total (Gacitúa-Marió 2000; CIA 2017). The largest indigeneous group is the Mapuche, which is estimated to comprise about 90 percent of Chile’s entire indigenous population. Chilean law recognizes seven additional peoples: Aymara, Rapuni, Atacameño, Colla, Quecha, Yagan, and Kawashkar. Today, over half of Chile’s indigenous population lives in cities, with approximately 40 percent in Santiago (Gacitúa-Marió 2000). However, indigenous peoples, especially Mapuches, are actively reclaiming rural lands. The Mapuche effectively resisted the Spaniards for the entire colonial era. After Chile gained independence, however, they faced new pressures as the fledgling nation sought to develop Araucanía. In the late 19th century, the Mapuche were forced to relocate and placed into a system similar to U.S. Indian reservations. A 1993 law paved the way for Mapuches to reclaim their lands, and there have been land conflicts since (*The Economist* 2009).

Along with being marginalized by the dominant culture, Mapuche women are repressed by Mapuche men. Mapuche culture relegates women to the private home sphere and men to the public sphere of work and politics, an ideal some claim is the product of colonialism. Along with challenging dominant sexist beliefs, Mapuche women seek to change material conditions. Protesting the fact that their male counterparts own the majority of the land, Mapuche women seek access to land and the land subsidies, which are primarily owned by men (the Chilean government forced single-person ownership of communally owned lands when Mapuche gained statehood) (Alorda 2010).

While indigenous and nonindigenous women worked together to oust Pinochet, Mapuche women today see their struggle as separate. Mapuche women point out their distinct conditions and struggles rooted in their indigenous heritage. For example, Mapuche women point out that their challenges in the workforce are distinct because they work as domestics, a job nonindigenous women rarely perform. Eschewing the battle cry of a universal Western gender discourse, Mapuche women frame their struggle as one for human rights and the quest for their indigenous community rights (Richards 2005).

Colombia

Overview of Country

Colombia, officially known as the Republic of Colombia (República de Colombia in Spanish), is located in the northwest tip of South America and is the only country in the region on both the Atlantic and Pacific Coasts. It borders Panama to the northwest, Venezuela to the east, Brazil to the east and southeast, Peru to the south, and Ecuador to the southwest. Colombia shares maritime borders with Jamaica, the Dominican Republic, Haiti, Honduras, Nicaragua, and Costa Rica. Located between latitudes 12° north and 4° south and longitudes 67° and 79° west, Colombia is an equatorial country, meaning the equator crosses it. Its primary seasons are rainy (April–June and August–November) and dry, and nights and days are typically equally long year-round.

The Republic of Colombia is roughly 440,831 square miles (1,141,748 sq. km), and its very distinctive geography is divided into six natural regions: the Andes Mountains, the Llanos (plains), the Pacific coastal region, the Caribbean coastal region, and the insular area with numerous islands both in the Atlantic and Pacific Oceans. This regional diversity mirrors the country. Being the second most diverse country in genes, species, and ecosystems, it is 1 of the 12 megadiverse and 1 of the 10 most biologically rich countries in the world (IUCN 2009).

In 2016, Colombia had approximately 47.2 million people, and projections are that it will have a total population of 50.9 million by 2020 (CIA 2016, DANE 2005). Of the total population, 51 percent are women, and 49 percent are men. Official statistics do not include transgender or non-gender-conforming people, and the Colombian Constitution only recognizes people as male or female. A product of *mestizaje*, a mix of traditions and cultures of American indigenous nations, Europeans, and Africans, Colombia's population is very diverse. There are 87 indigenous groups, 3 differentiated Afro-Colombian groups, and Roma or Gitanos (gypsies). As of the 2005 census, 3.43 percent people are indigenous, 10.62 percent are Afro-Colombian, 0.01 percent are Roma, and at 84.94 percent, the majority are not part of any specific group (DANE 2005). An Afro-Colombian group called Raizal inhabits the archipelago of San Andrés, located in the Caribbean Sea, along with Colombians from the mainland.

Colombia's ethnic diversity matches its language diversity, as there are 64 Amerindian languages; *Bandé*, a language of the archipelago of San Andres and Providencia; *Palenquero*, a Creole language of the San Basilio de Palenque community; and *Romaní*, the language of the Roma. All coexist with Spanish as spoken languages. Spanish is considered the country's official language, but all are recognized by Colombia's Constitution and are considered official in their territories (Constitution Finder 1991).

Colombia has an emerging, or developing, economic market. Its primary products are petroleum, mining, manufacturing goods, and agriculture. Although the country has experienced an annual growth of 5.5 percent since 2002, its inequitable distribution of wealth means 29 percent of people live under the poverty line. Colombia is the fourth-largest coffee producer and the largest smooth coffee producer in the world. In addition, UNESCO named the coffee-growing region (*Eje cafetero*) as a world heritage site for its innovative management practices, community focus in the production of coffee, and protection of families and their cultural heritage traditions.

Historical Background

Before the arrival of Europeans to the Americas in 1498, there was a distinctive indigenous society. The *Cacicazgo* was the political system the Amerindians, and specifically the Muisca, Taironas, and Quimbaya groups, had installed. It consisted of a pyramid-like structure where

the *cacique*, or chief, was the head of society, and there were specific social strata.

In 1499, Alonso de Ojeda, accompanied by Américo Vespucci and Juan de la Cosa, arrived in the now Colombian territory for the first time. After a couple of journeys back and forth, in 1509, Alonso de Ojeda founded the first Spanish settlement. The Spaniards brought with them African slaves, and so the three groups—Amerindians, Europeans, and Africans—were in contact. Between 1509 and 1819, Spaniards took control of the area. It was not until 1810 that an independence movement started.

On July 20, 1810, in Santafé de Bogotá, the *Criollos* (people of Spanish origin born in the Americas) started the emancipation process when a Spaniard rudely denied lending a flower vase to a *Criollo*. This was an excuse to have the Spanish government overthrown and a local government of *Criollos* installed. However, due to differences in ideology inside the independence movement—which was divided between federalists and centralists—the Spaniards regained power in 1814.

Still, the ideas of liberty and equality brought from Europe by local intellectuals such as Antonio Nariño, Francisco Miranda, and Camilo Torres and the victory in the Boyaca battle (August 7, 1819) led by Venezuelan independence leader Simón Bolívar were key to gaining absolute independence from Spain. After the success, countries that were led to independence by Bolívar—Venezuela and La Nueva Granada (former Colombia, which included Panamá)—formed one republic: La Gran Colombia. However, this union broke up in 1831 due to instability. Between 1831 and 1886, Colombia went through many political changes, which included the creation of Colombia's two oldest political parties: *Conservadores* (conservatives) and *Liberales* (liberals). By the second half of the 19th century, Colombia entered the capitalist market. In addition, slavery was abolished on January 1, 1852. However, it was not until the 1886 constitution granting suffrage to males without restriction that the republic was created. In 1853, in the province of Vélez in Santander, an unprecedented event happened, and women were granted the right to vote (Velásquez 1989, 37). This did not translate to Colombia as a whole.

The San Andrés archipelago also has a distinctive liberatory history. Its indigenous population was quickly decimated after the arrival of the Spanish and enslaved Africans. It was colonized by the Puritan English, the Dutch, and *Criollos*, people of Spanish descent born in

Colombia who aligned with the Antillean Caribbean rather than the Spanish colonies. In the 19th century, the island had a very weak presence in the mainland Colombian government, to the point that people in San Andres liberated enslaved Africans much sooner than the rest of the country.

For women, the 20th century was the beginning of many changes. Starting with the approval of a law that was strongly fought for by the women of the Centro Femenil Colombiano (Colombian Women's Center), which allowed women to inherit their family's assets, women could finally manage their patrimony in 1933. In 1945, women were seen as citizens by the law, though they were not allowed to vote until 1957.

By 1959, due to violence, a significant migration of people from the countryside to the cities drastically changed the country to a more urban society; it was 42 percent urban in 1946, 53 percent in 1959, and 74.3 percent by 2005 (DANE 2005).

With the government of Alfonso López Pumarejo, who reformed the constitution in 1936, people were allowed to organize in unions and had a right to strike. López Pumarejo promoted the development of the national University of Colombia.

In 1948, the assassination of Jorge Eliecer Gaitán, a populist candidate for the presidency, started the Bogotazo, a violent event that started a time known as "La Violencia," a civil war between liberals and conservatism that lasted until the beginning of the 1960s and killed more than 200,000 people, mostly peasants and laborers. After this period ended, several guerrilla groups, such as M19, FARC, and ELN, organized in addition to other right-wing paramilitary groups. The guerrillas began because of the discontent with the current situation in the country. The guerrilla group Fuerzas armadas revolucionarias de Colombia (FARC) was born in 1964 with the objective of ending social, political, and economic inequities with a Marxist-Leninist ideology. In the same year, the Ejército de liberación nacional (ELN), with a similar Marxist view, appeared, but with an emphasis in liberation theology, an ideology that started with Latin American Catholic priests fighting for social justice.

Guerrilla groups have been in constant conflict with the Colombian government since their birth, but it was not until the 1990s that the conflict escalated, mainly in rural areas of the country. Also, from 1984 to 1991, the Movimiento armado Quintín Lame (MAQL) appeared, which was an indigenous group that wanted to extend

indigenous territories and protect indigenous groups from nonindigenous landowners.

The last decade of the 20th century marked Colombia. In 1991, a new constitution was created that completely changed old views that had forged the country. Ethnic, linguistic, religious, and cultural diversity were recognized and protected by the government for the first time. Neo-liberal ideas about the privatization of many public companies and entry into the global market had started to take hold. In addition, a new legal instance was created, the "acción de tutela," which enables citizens to protect their fundamental rights by allowing them to protest and get their issue solved in no more than 10 days. Furthermore, in the presidency of Andrés Pastrana Arango, a peace treaty with FARC started by Pastrana's willingness to play by FARC's terms. Unfortunately, peace was not achieved, and this only resulted in the strengthening of the guerrillas and the modernization of the Colombian military.

The next elected president, Alvaro Uribe Velez, had a stronger military emphasis than his predecessor and had more armed success against the guerrillas. In addition, his government started with new commercial agreements that were solidified by Colombia's latest president, Juan Manuel Santos, who in September 2012 started a peace treaty with the FARC and ELN guerrillas. Negotiations held in 2015 led to a peace agreement in 2016 (Phippen 2016).

Overview of Women's Lives

Colombia has advanced women's rights and decreased social gender inequities in the last few decades, especially in education legislation and health. However, many areas call for improvement: violence, both domestic and due to internal armed conflict; access to resources; and political participation and autonomy. There is a gap between government and women's everyday reality. Domestic violence is penalized, for example, but there are still many victims of it, and reduction rates are very slow. In 2005, 39 percent of women were victims of physical violence, and by 2010, it had only reduced to 37.4 percent (UNDP 2013). In addition, not all women have access to the same resources; class, race, and origin are still determinants of women's being subject to discrimination. Afro-Colombian, indigenous, and poor women are the most vulnerable groups. In 2014, the UN Development Programme ranked Colombia 98th out of 187 nations based on the Gender Inequality Index (GII, 0.460), placing it in the high human development category (UNDP 2014).

Girls and Teens

Education

In the colonial era, women had very few life choices; their main role was relegated to the home and the activities that came from their responsibilities as mothers and wives. Until 1538, there were no schools for women. The first schools that were created for women had as their main objective to prepare them for marriage or, if marriage was not a prospect, women would be prepared to serve God. From 1538 to 1738, schools for women were dedicated to instructing them to read, write, sew, and do other domestic activities related to their gender (Herrera 1995, 332).

After Colombia broke free from Spain and the republic was created, the country's new constitution in 1821 encouraged increasing public education for women to improve the quality of the newly created nation. This new vision would make the country a happy and civilized nation ready to face progress (334). However, the nation's lack of economic resources for this endeavor resulted in a very poor-quality education, mainly based in authoritative repression and memory. Elite women had a different experience because they were instructed in literature, science, and the humanities within their social sphere in *tertulias* (social gatherings). Over time, many more schools were created, but there was little change in women's education: their lives revolved around family, father, brothers, or husband, who made all of their decisions. The century ended with a mostly private and religious education system focused on reinforcing gender roles where women were good housewives and domestic beings (338).

Educative Shift

The 20th century brought changes that completely shifted the development of the country. At the beginning of the century, Colombia started to be politically and economically structured. It was with the introduction of the capitalist system and industrialization that the country began being part of the global economic system; slowly women were incorporated into the workforce as the need for newly created factory and manufacturing production exploded. Coffee became Colombia's staple export, and other factors, such as the improvement of transport systems and highways, made significant social changes possible. A middle class developed along with literary, cultural, and workers movements. Through the beginning of social movements and the recognition of women's civil and political rights

worldwide, women began to appear more and more as equal social members.

Contemporary schools are very equitable in terms of gender. In 2011, girls were being schooled in similar numbers as and learning the same content as boys; boys make up 51.4 percent of preschoolers and 52.1 percent of primary school children. By middle and high school, the majority are girls, at 51 percent. Among teachers, the majority are women, especially in preschool (96%) and primary schools (77.8%); in middle and high schools, there are a similar number of women (49.8%) and men (50.2%) (DANE 2005).

Major inequalities are seen in rural areas. There are noticeable differences in the numbers of urban versus rural children (ages 5–17) enrolled in the school system. In 2004, 82.5 percent of children were enrolled in urban areas and 70.2 percent in rural areas (Pinilla 2006).

In a 2007 study, on average, women in urban areas had 11.2 years of education and men 10.3 years. However, in rural areas, this decreased to 6.9 years for women and 5.4 years for men. Taking race into consideration, inequalities in educational attainment are seen. Afro-Colombian urban citizens have on average more years of education at 9.8 years compared to their rural counterparts at 5.6 years. This is less than for the general population, whose averages are 10.8 years for urban and 6 years for rural Colombians (Burgos González 2007).

Women obtained the majority of higher education degrees, with 54.3 percent, between 2001 and 2012. Undergraduate university education shows the largest increase of female graduates, with women having earned 57 percent of bachelor's degrees. In general, women tend to study social sciences and humanities more than science and engineering. However, even if there are more women than men in the school system, in 2002, only 57 percent of women of working age were part of the workforce—continuing the hidden gender agenda that women are taught to stay home and be wives and mothers.

Literacy

According to the World Bank, by 2012, 94 percent of Colombians aged 15 and older can read and write a short, simple statement about their normal life (World Bank 2015). However, when it comes to the younger population, ages 15–24, the numbers are higher: there is a 98.7 percent literacy rate for women and 97.8 percent for men (UNICEF 2013).

Sexual Education

Since the 1960s, Colombia has received international pressure to start programs to control birth rates. In response, few topics covering sexuality were included in science and health education, and it was not until the creation of the constitution of 1991 that sexual and reproductive rights were considered as important as social, economic, and cultural rights. In the 1994 International Conference on Population and Development, it was concluded that to improve the cover and quality of reproductive health, education had to be a key element to allow people to exercise their reproductive and sexual rights. With this, the Colombian Constitutional Court stated the need to have sexual education in place, and the Department of Education made it mandatory for people to get a sexual education that would consider the physical, emotional, and psychological needs of the students.

The goal of this education is to guarantee the constitution of human subjects, who can regulate and control their sexuality through self-discipline, closely following and adapting to established definitions of normality. The concept of youth used for education follows a very strict model of psychological and moral development based on age (Viveros 2004). For some scholars, this model of education can be highly problematic because it sees sexuality as coming before socialization and culture, imparting a rigid view of gender based on two fixed notions, masculine and feminine, completely removed from history, culture, and class (Viveros 2004).

In the past, sexual educators used the media (pamphlets, television, radio) to promote views and ideologies for sexual behavior. It is very problematic that, even if in theory, young people are learning to become active decision makers about their reproductive and sexual health but are still seen as dependent subjects of the adult world whose voices are not heard or incorporated into the debates around sexuality. Even though Colombian policy includes youths in the conversation, in practical terms, this does not happen. Young Colombians have no say on the formulation of sexual and reproductive health policies that are intended to benefit them. In addition, when adolescents participate as facilitators in workshops, they only repeat the information given to them without having critical tools to decide or influence the topics and focus. There are used symbolically, but they have no real power over the programs (Viveros 2004).

The TV series *Francisco el Matemático* (1999–2003) was the first strategic alliance between a private television

channel (RCN) and the Pedagogical Development Institute of Bogotá. The series was about a public school in Bogotá and the different issues students had to deal with. It especially focused on sex education topics, human trafficking prevention, alcohol and drug consumption, and political participation of the youth. Nevertheless, one of the biggest opponents of public policy related to sexual and reproductive health rights has historically been the Catholic Church. Their opposition has mostly been about access to condoms to prevent the spread of HIV and emergency contraception, as it is seen as a form of abortion.

Sexual Initiation

Colombia's legal age of consent for sexual activity is 20. Sexual consent is valid only if no violence, prostitution, or pornography is involved. No one younger than 18 can be part of sexually explicit photographs or videos. By 2010, 13 percent of women had engaged in sexual intercourse before their 15th birthday. Also, when comparing rural and urban women, young women start having sex on average when they are 17.5 years old—sooner than their urban counterparts, who on average start when they are 18.5 years old.

Teen Pregnancy

In the early 2000s, Colombia had many changes in teen pregnancy rates. According to the 2008 report by Pro-familia (a nongovernmental organization (NGO) that specializes in sexual and reproductive health), sexual education strategies have proved to be ineffective. In 1990, 1 out of every 10 young women between 15 and 19 years old was pregnant or already had a child; in 2007, the amount had doubled (Castro 2007). However, between 2007 and 2013, this fell to 8.2 percent. There is a very strong correlation between adolescent motherhood, literacy, and education: 55 percent of teen mothers have no education, 46 percent have primary school education, 18 percent have a high school degree, and 11 percent have higher education.

Sports and Recreation

Fútbol, or soccer, is the most popular game in Colombia, but it is not the national sport. When people think of soccer, they usually see it as a sport for boys and men. Colombia's professional women's soccer team does not have a very long history; its first international appearance was for the South American soccer cup in 1998. Despite this short

history, it is one of the best-ranked teams in the region. Colombia is the third country in South America, along with Argentina and Brazil, to qualify for the Olympics and the World Cup.

Colombia's national sport is *Tejo*, a sport created 500 years ago by the Muisca, an indigenous group who inhabited Cundinamarca and Boyaca (in the center of the country). At the time of the conquest, *Tejo* was very important because it gathered people who would also exchange products while they played. The game consists of throwing a metal disc (the *Tejo*) through an alley to a board covered with clay. The goal is to impact the inside of the target located at the board. Although it is more common to find men playing it, both men and women play it today.

Another Colombian sport, and the oldest in the country, is the *Chaza*. Indigenous people of the Colombia-Ecuador border created it in the 15th century. *Chaza* is similar to tennis, but it is played in two teams of four people each. Men traditionally play this game, but there is no official rule that forbids women from playing it.

It was the 1968 Olympic Games held in Mexico when Colombia sent five women to the Olympics for the first time—32 years later than men. Women have won two gold medals: for BMX cycling and weight lifting. Women's and Afro-Colombians' participation in sports at this level is growing. In the 2012 Olympic Games, Colombia sent more women (58) than men (46), and 11 out of the 19 medals were won by Afro-Colombians, even though they comprise 10.62 percent of the population.

Colombia has been very successful in the inline skating world cup, winning 12 out of 23 championships, making it the country that has won the most times. With six world championships, Cecilia Baena is Colombia's best inline skater. UNICEF awarded her for her work defending and promoting children's and teens' rights in Colombia.

Health

Between 2005 and 2012, the leading cause of death in women was diseases of the circulatory system, causing 33.85 percent of deaths. At 28.36 percent, the second-leading causes clustered in a group of different diseases: diabetes, nutritional deficiencies, chronic respiratory diseases, and chronic liver diseases. The third reason for death was neoplasias, or cancer, at 20.91 percent. Despite cancer being the third most prevalent cause of death in the country, only 62 percent of women aged 18–69 have ever done

a breast self-exam, whereas just 39 percent do it monthly as recommended (Wiley Online Library 2011).

Access to Health Care

In 1993, Ley 100 (Law 100) was created to facilitate health access and retirement transformations. Since then, the country has experienced an increase in the number of people covered by the health system, from 56.9 percent in 1997 to 90.8 percent in 2012. However, according to one study, only 75.5 percent of people actually use the services when needed. This is due to a variety of reasons: health care offerings, poor quality of services, lack of money to pay for services, or a perceived need to look for care. There are vast differences in the percentages of health demand, ranging from 85.4 percent in the Valle del Cauca, a more industrialized department, to 70.7 percent in Orinoquia, a less developed department. People who do not go to a health provider when needed handle their issues in various ways: 34.9 percent use home remedies, 29.3 percent self-medicate, 21.8 percent see a pharmacist, 10.7 percent do nothing, and 2.4 percent visit a healer, herbalist, or uncertified medical provider (6).

The Colombian health system divides citizens in two: the subsidized and the contributive. Subsidized people are those who cannot afford to pay and become part of the system of identified beneficiaries. People in the contributive category are those who either are employed by a company or are self-employed or retired people and their families. Usually, the employer is obligated to pay for the employees' and their family's contributions.

Though the system has increased health care access dramatically, people in the medical profession have had little to say about running the system. One of the biggest concerns has been preventative care; health care providers have had ineffective campaigns, which even led to people being too sick to get care on time (Caracol Radio 2013). Before getting needed care, patients need to have administrative authorizations, which has resulted in patients suing the providers and causing a burden to the judicial system.

Maternal Health

With the increase of health access, in 2010, 97 percent of childbirths occurred in a medical institution; 95 percent of babies were born with a doctor; 2 percent were with a nurse; and the remaining 3 percent were born without the help of a professional. There are no records of the use of midwives in childbirth (Wiley Online Library 2011).

Despite the increase in professional birth care, low birth weight rates have increased along with the increase of unwanted and teen pregnancies and because of the poor health care access in some remote rural areas (PAHO 2002).

Prenatal care varies according to various factors, such as urban versus rural, level of education, and social class. Women with post-high school education have high rates of prenatal care, 98 percent. However, only 24 percent of women who are under 20 years old, older than 34, from a rural area, and without education get prenatal care. Only 8 percent of the poorest women of the country get care, and in some departments (states), such as Chocó, Vaupés, Vichada, and Guaní—where mainly Afro and indigenous communities live—prenatal care is very scarce (Wiley Online Library 2011).

Breastfeeding practices have been strengthened: 42.2 percent of women now exclusively breastfeed until the child's sixth month, up from 24 percent. For maternal mortality, a plan was created and has already seen reduced rates, from 100 deaths for every 100,000 births in 1998 to 75 deaths in 2006 (PAHO 2002). Childbirth mortality rates have fallen from 19 deaths per 1,000 births in 2005 to 16 in 2010. Additionally, in 2010, 80 percent of children younger than 2 years old have had all their vaccines (Wiley Online Library 2011).

Sexually Transmitted Infections

Although the country has had multiple campaigns to promote the use of condoms, the promotion has proven ineffective: only 7 percent of women in a heterosexual relationship use a condom, while 93 percent take no precautions against sexually transmitted infections, including HIV/AIDS. Women do test for HIV; 40 percent of women aged 15–49 years have been tested (Wiley Online Library 2011).

It is estimated that 120,000 people live with HIV in Colombia, but only 41,900 cases are officially reported, representing 0.5 percent of the population. Among those affected, most of the cases (71%) are found in people 15–49 years old. Of these, men at 20 percent and women at 19 percent, in the age group 25–29 years old, are most affected. Most were infected through heterosexual sex (45%), 17 percent through homosexual sex, 6 percent through bisexual sex, and 29 percent did not know how it was contracted (UNAIDS 2015).

A study found that women were more vulnerable than men in their ability to prevent contracting HIV and

to be treated. Due to the dominant culture, it is socially unacceptable for a heterosexual woman to be unfaithful; therefore, women who ask their partner to wear a condom might be seen as “suspicious” of something they would only ask a lover. Women are expected to trust their partner and respect their partner's right to not have diminished pleasure, which many believe happens with condom use (Avert 2016).

Mental Health Issues

A 2015 study of mental health found that 12 out of every 100 adolescents were suffering with mental health issues compared to 10 out of 100 adults. Young girls are more at risk for posttraumatic stress disorder (PTSD), are more prone to anxiety, and have twice the mental health illnesses as boys. Older women were found to have mental health illnesses in every category except bipolar disorder, which was more present in men (El Tiempo Salud 2015). Some mental health issues are due to Colombia's long-standing internal conflict.

Employment

Before the 20th century, women, with very few exceptions, were solely dedicated to domestic work, having and raising children and keeping house. However, since housework was an “invisible job” and was not paid, it was not considered in employment statistics, even though it is a key part of the nation's development. In addition, women worked in the informal production of goods (homemade ice cream sales, clothing creation, food production, etc.), which at times surpassed income brought home by their male counterparts. In rural areas, women worked in informal, unpaid labor, raising animals and growing crops, among other chores, which men had done prior to their wholesale migration to work as day laborers in big production centers (Gutierrez 1995, 316).

As most women worked in invisible jobs as the primary caretakers of the home, it was not until recent decades that women achieved working legal protection. However, even when women fully entered the workforce outside of the house, they were still expected to handle household chores and take care of the family. Most employers prefer to hire men because they have fewer duties outside the professional realm (Caputto Silva 2008, 116).

In 1990, women comprised 39.4 percent of the workforce, but most of them worked in the least-developed

sectors of community services and commerce. Within those two main sectors, most women, 96.5 percent, worked as domestic workers. In addition, differences in pay, both in the formal and informal sectors, varied vastly by gender (Gutierrez 1995, 304). Currently, women are 50 percent of the professional and technical workforce, and of the women who work, 34.3 percent work in commerce, hotels, and restaurants. Women in community, social, and personal services number 30.7 percent, and women in manufacturing number 13.6 percent (Lully 2011). At 53 percent occupancy of middle and senior management positions, Colombia had the second-highest percentage of women in managerial positions out of 126 countries as of 2010 (ILO 2015, 19).

Maternity Leave

Women are entitled to a total of 14 weeks of maternity leave, whether they are the biological mother or an adopting mother. They are entitled up to 2 weeks as a prebirth leave. However, if for whatever reason the woman does not take two weeks before, she can take all 14 weeks after the birth. If the baby dies, the woman will still get 2–4 weeks to recover. On the other hand, men are entitled to up to 8 working days of paternity leave.

While the mother is on leave, she will receive the same salary she was getting when she started her leave. If she does not earn a stable salary, her maternity leave salary will be an approximation of her salary; her health insurance provider pays the leave. Mothers are also entitled to two 30-minute breaks a day for nursing and lactation. They may have more breaks if prescribed by the woman's health provider. A new law was passed which increased maternity leave from 14 to 18 weeks (DLA Piper 2017).

Family Life

After independence from Spanish rule in the 19th century, the newly founded nation was created under the ideologies of the educated Criollos. Criollos believed in the maintenance of Catholicism, Castilian Spanish as the official language, a relationship with nature, privatization of land, the implementation of a formal education system, and family as the center point of society (Bermúdez 1995, 242).

Marriage was key and monogamy the norm. People could only marry one person, but women were instructed to be tolerant with cheating husbands and to always strive to keep the husband happy so he would not leave the home.

By the middle of the 19th century, love started to be a key element for marriages and the nucleus of family life: love was a fundamental key for a happy life.

However, not every region of the country had the same family structure and relationships. Women in the Cundinamarca and Boyacá region who had a Muisca heritage had more economical and sexual freedom. Those who worked in coffee plantations in this region were frequently sexually abused by their bosses, but they also used sex for personal advancement and to get special treatment (Bermúdez 245).

In addition, Afro-Colombian communities that still lived under slavery did not live under the ideologies of the privileged Criollos, and neither did indigenous communities such as the Bari or the Nukak, both of whom practiced egalitarian nonpatriarchal ways of living.

Family Planning

Colombia has been going through a slow reduction of birth rates. In 1985, there was an average of 3.42 children per women, 3.15 in 1993, and 2.48 in 2005, a decrease of 27.5 percent. However, these decreases are not equally represented in all women. There is a strong correlation between the socioeconomical development of a department (similar to a state) and birth rates. Departments where women have more access to education, jobs, and modern contraception methods have lower birth rates; for example, in Bogotá, there was an average of 1.92 children per women, contrasted with Choco, which had an average of 4.35 children per woman.

In the 2005 census, the average household was 3.9 people, and at 69.7 percent, most people lived in a house. When it comes to birth control, 79 percent of Colombian women in a heterosexual relationship use contraceptive methods. The most used method is tubal ligation, which 35 percent of women do (Wiley Online Library 2011).

Politics

Political Participation

Through politics, women can publicly express their agency and be agents of change. According to the United Nations, only 12 percent of women in Colombia are in political office. Of these, 14 percent are on a city council, 17 percent are representatives, 21 percent sit on congress, and 9 percent are city majors. This discrepancy exists even though more women than men have university degrees.

Although women were granted the right to vote in 1954, it is still a significant challenge to have an equal number of women in the government. The 1991 constitution recognized this and made women's participation in public administration roles an obligation. Various laws have been created to increase women's participation in the public arena. Law 581, adopted in 2000, states that it is mandatory for women to hold 30 percent of all decision-making positions in public administration. Additional laws were created in 2011 to further ensure gender equality. Law 1450 was created to adopt a national political agenda to ensure gender equality and human rights protection. Law 1475 defined gender equality as men, women and any other sexual minority as having the right and opportunity to equally participate in all aspects of politics, which includes managing political parties, being part of political debates, and having political representation (Alta Consejería Presidencial para la Equidad de la Mujer 2011). In addition, Law 1434 created a commission, Comisión Legal para la Equidad de la Mujer en el Congreso, that guarantees women's equality in congress, proposes laws so human rights for women are protected, and promotes new plans, programs, and public policy.

Law 580 was an important step in the promotion of women's political participation. Although the results are promising, more needs to be done to ensure real political participation and to punish those who fail to carry out the new laws and mandates. According to the *Global Gender Gap Report* in 2014, Colombia ranks 67th out of 142 countries in political empowerment (UNDP 2014).

Religious and Cultural Roles

Since the coming of the Spaniards to the New World, Catholicism was the official religion in Colombia until 1991. As of today, 95 percent of Colombians self-identify as Christians; however, of the 92 percent of Colombians who were raised Catholic, only 79 percent currently remain Catholic (Pew Research Center 2014). The strong influence of the Catholic Church, which does not give a strong voice to women, has not benefited women. Those who have tried to become priests have been strongly opposed by the Vatican. Olga Álvarez, for example, joined the American movement to have women become Catholic priests. She was successfully ordained and performed over 40 masses around the country; the Vatican, however, has not made her priesthood official (Plaza 2011).

The 1991 Colombian Constitution explicitly separates church and state. Catholicism is not the official religion,

as there is no official religion. Article 13 of the Constitution prohibits discrimination because of religion, and Article 19 allows freedom of religion and all missionary activity. In addition, no public institution may give religious instruction. However, even if by law Colombia is a secular nonreligious country, Catholic views directly influence laws that could benefit women. For example, abortion is only legal when a woman's life or health is in danger, when the pregnancy was a result of rape, or when the unborn baby has malformations that would make his or her life unviable. Legal abortion in every circumstance goes against Catholic sentiment about sin; therefore, it has not been accepted.

Even though Colombia is mainly a Christian country, with many different denominations, there are also Protestants (15%), non-Catholic Christians (14%), agnostics (2%), and other faiths (4%), such as Judaism and Islam (Religious Freedom 2013). During the colonization period, Jews who arrived to the colonies had to hide their religious practices, especially during the Inquisition. After independence from Spain, new groups of Jews migrated from Curacao to trade goods between the island and Colombia. Jews continued common matchmaking practices with their communities in Europe, the Americas, and other areas.

In San Andrés Island, Philip Beekman Livingston (1800s), a local man who left to attend schools in the United States, founded the Baptist Church after he returned to the island and started to educate the children of freed slaves. He affiliated his church to the Lighthouse Street Baptist Church in Manhattan around 1845. By the end of the century, 95 percent of the island's population was Baptist. (Bermúdez 1995, 277–278)

Issues

The Armed Conflict

The biggest and most important obstacle that Colombia has dealt with has been the internal armed conflict of the late 20th and early 21st centuries. It has taken resources away from infrastructure, education, health, democracy, and other important areas for diminishing inequity. In addition, it has affected human development, the fight against poverty, governability, transparency, and human rights (UNDP 2013).

A 2013 report by the Centro de Memoria Histórica (National Center for Historical Memory) showed the final numbers of deaths due to the consequences of the conflict.

Around 180,000 civilian and 40,000 noncivilian people have died due to violent crimes. Additional atrocities include 25,000 disappearances, 27,000 kidnappings, and 2,000 massacres. Five thousand children were forced to join the illicit armed forces, and approximately 4 million people have been displaced (Centro de Memoria Histórica 2013).

Women have especially suffered as victims of the violence of the armed conflict: the war has left deep scars in their minds and bodies, changed their routines, altered their lives, destroyed their families, and displaced them from their homes. Widows have suddenly had to deal with not only the economic responsibility but also the emotional responsibility of the family, without time for mourning or being sad. Some social and political women leaders have been murdered, threatened, and displaced to impede their community outreach initiatives. Rape has been a war strategy, and most raped women were verbally and physically tortured as well, leading to high numbers of early-age pregnancies, sexually transmitted infections, and emotional trauma. Young girls have been particularly targeted, affecting their abilities to trust and create healthy relationships. Children have suffered as direct victims, witnessing and being victimized by violence firsthand through sexual abuse and torture trauma, forced illicit recruitment, and body mutilations due to antipersonnel landmines (Centro de Memoria Histórica 2013, 67). Between 1990 and 2015, of a total of 11,097 victims, 1,194 minors were victims of antipersonnel mines; 247 were girls, and 869 were boys (Acción Contra Minas 2015).

The lesbian, gay, bisexual, transgender, and intersex community (LGBTI) has strongly felt the conflict on all fronts. Members of this group have suffered acts of violence due to their sexual and gender identities. Violence against the LGBTI community has been combined with a “social cleansing” discourse that has stigmatized, persecuted, and threatened this community (Centro de Memoria Histórica 2013, 70).

Even though the armed conflict has affected all communities, Afro-Colombians and indigenous groups have uniquely suffered. One study found motivations of cultural extermination were identified. In addition to historic systematic discrimination, crimes against these communities to intentionally undermine and exterminate them were found. Between 1996 and 2006, 1,190 indigenous people were murdered; given that some indigenous groups are on the verge of extinction (32 of them have less than 500 people), these numbers are extremely high.

The case of Afro-Colombians is not better: by 2007, 43,630 people were forcefully displaced, and by 2010, 20,542 had lost their homes. The war has made these two minority groups see how their territories were misused, controlled, and robbed for a variety of reasons. Displacement limited the communities’ normal social and productive activities and inflicted deep collective and individual estrangement from their lands. For Afro-Colombian and indigenous communities, the land represents much more than a spatial place, it represents their livelihood. How they work on it, enjoy it, and suffer for it is the root of their existence (Centro de Memoria Histórica 2013, 70).

U.S. Role in the Colombian Armed Conflict

The United States has been a strong supporter of the armed conflict against drug trafficking and terrorism, assisting the Colombian government with Plan Colombia since 2000. The United States has given the Colombian government over \$5 billion, primarily for police and military support (Amnesty International 2016). Critics of Plan Colombia, which had mixed results, are worried about the flagrant human rights violations, including impunity, but that has not diminished U.S. economic and military aid (Amnesty International 2016).

Racial Disparities

A 2008 report outlined systematic racial discrimination against the Afro-Colombian population. Most Afro-Colombian people are geographically separated from other Colombians; the Pacific and Atlantic coastal departments of Valle del Cauca, Antioquia, and Bolívar are 50 percent Afro-Colombian (Rodríguez, Alfonso, and Cavelier 2008, 24). When comparing basic statistics between Afro-Colombians and the mestizo population, a huge gap is evident. Mortality and life expectancy rates show an undeniable disparity: Afro-Colombian boys die 1.78 times more, and Afro-Colombian girls are twice as likely to die than the national average. In addition, Afro-Colombian men live on average 6 years less and women 11 years less than the national average (Rodríguez, Alfonso and Cavelier 2008, 29). Poverty rates also reflect discrimination: 60 percent of Afro-Colombians are poor, and in rural areas, two-thirds are poor. Almost one of every five Afro-Colombians lives under the poverty line and does not have enough resources for a minimal diet. (Rodríguez, Alfonso, and Cavelier 2008, 31).

In response to claims about systematic racism, the Colombian government denies racial discrimination, saying the issue lies in the fact that Afro-Colombians live in “inhospitable,” geographically isolated places, which contribute to high poverty rates, low educational attainment, and the lack of health infrastructure. Critics counter by stating that denying the existence of systematic racism does nothing to end these issues. (Rodriguez, Alfonso, and Cavelier 2008, 28)

In recent years, Choquibtown, an Afro-Colombian hip-hop group and winner of a 2010 Latin Grammy and nominated for two Grammys in 2011 and 2105, has been publicly known for denouncing racism in Colombia. Their Grammy-winning song “*De donde vengo yo*” (“Where I Come From”) shows images of the realities of Afro-Colombians whose lives are invisible to the rest of the country. They protest, “National and international invisibility, self-discrimination without reason, imminent racism, a lot of corruption . . . war machine, displacements for land interests, etc.” In a 2011 interview, the group said that, in general, “people in Colombia are racists without even noticing it, acting in racist ways: they may love soccer, love the places where Afro-Colombian people live, love ethnic groups, but don’t want their families to relate to black people” (Contreras 2011).

Beauty Standards

Colombian women have a reputation for being beautiful, and that reputation comes with the well-known practice of many women undergoing plastic surgery to attain a certain beauty standard. Breast augmentation is the number one intervention, and in cities such as Medellín or Cali, getting it is a common *quinceañera* gift. “Beauty is a national obsession,” to the point that cosmetic companies and matchmaking services for foreign men to find Colombian wives thrive (Forero 2001). This standard extends to the more than 3,000 beauty pageants each year, ranging from Miss Colombia to Miss Café; many of them focus on the country’s natural resources and involve underage girls.

Women’s Organizations

From the beginning of the 20th century, women’s organizations have prospered and multiplied. Centro Femenil Colombiano (Colombian Women’s Center) was one of the earliest organizations that pushed to get women’s land and inheritance rights in 1933; after that, many others have flourished. For example, after the new constitution

gave women and minorities rights that were previously denied, the Red Nacional de Mujeres (National Women’s Network) was articulated in 1991. This network consists of 63 women’s organizations in 14 cities across the country. Their three focuses are women’s political participation and construction of citizenship, elimination of women’s violence, and women’s participation in the peace-building processes. Also, in 1990, a ministry for youth, family, and women was created to eliminate all forms of violence. In 2010, these efforts led to the current *Consejería Presidencial para la Equidad de la Mujer* (President’s Ministry for Women’s Equity), which works to promote rights, policies, and partners with grassroots organizations to improve women’s lives.

Costa Rica

Overview of Country

The Republic of Costa Rica is located in Central America, bordered by Nicaragua (north), Panama (south), the Caribbean Sea (east), and the Pacific Ocean (west). It is inhabited by nearly 5 million people, approximately half female and half male. Racially and ethnically, the population is

quite homogeneous: 94 percent identify as white (*mestizos*, or those of mixed Spanish heritage) and the remainder as Afro-Caribbean (3%), Chinese (1%), foreign-born residents (1%), and indigenous (1%). Spanish is the official language, although many *ticos* and *ticas* (the Costa Rican terms for males and females, respectively) also speak English. Indigenous populations retain their tribal languages, but most also speak Spanish. Approximately three-fourths of the population identifies as Catholic. Other religions include Evangelical, Protestant, Jehovah's Witness, and indigenous belief systems.

Costa Rica is socially progressive, democratic, pro-human rights, and environmentally conscious. Latin America's most democratically developed country, it ranks 22nd overall in the world in this regard (*The Economist* 2012). It is referred to as "the Switzerland of Central America," a moniker that depicts it as democratic and stable while simultaneously dissociating it from the violence, armed conflict, and criminal activity, such as drugs, organized crime, and human trafficking, that are often associated with the region. Catholicism maintains a strong presence in the country; yet, it lacks much of the fervor often found in other Latin American countries. Other religions are accepted. Costa Rica is decidedly pacifist and has not had a military since 1949. Its gross domestic product (GDP) per capita is USD\$12,000 (UN Population Fund 2012), and its comprehensive public education and public health systems have led to high literacy rates, life expectancy of nearly 80 years, and low infant and child mortality rates. Costa Rica scores well in the Human Development Index (HDI) in regard to income, education, and health (Malik 2013). Its conservation efforts are ambitious and include the designation of approximately 25 percent of the country's landmass as protected within the national park system. Indeed, its environmental agenda has become a model for countries throughout the world (Evans 1999, 7).

Yet, there is much more to the country and its people. As a small developing nation, Costa Rica remains vulnerable within the global economic and political landscape. Poverty rates have remained around 20 percent for the past two decades (INEC 2011). There are also persistent inequalities. In addition, there is an ongoing struggle with foreign influence, including from political and economic partners, multinational corporations, and the over 2 million tourists that visit the country every year. This has strained the country's natural resources, raised questions about future development, and altered tico (Costa Rican) culture and identity.

Biodiversity and History

Costa Rica is perhaps best known for its natural environment and biodiversity. It occupies one-third of 1 percent of the earth's landmass, yet boasts a concentration of plant and animal species that is unparalleled. Five percent of the animal species on earth are found in this subtropical country, including hundreds that are endemic. There are over 300,000 insect species. Plant species are similarly plentiful and include approximately 2,000 species of trees and 1,200 species of orchids (Living National Treasures 2014). In addition, the landscape is diverse and includes tropical, deciduous, mangrove, and cloud forests; Pacific and Caribbean coastlines; numerous volcanoes, including six active and dozens of dormant; and a total of 12 climatic zones. There are two main seasons: the wet or rainy season (May–November) and the dry or green season (December–April).

Costa Rica's biodiversity and natural beauty prompted Spanish explorers to dub it "the rich coast" and claim it as a colony in the 16th century. Costa Rica remained under Spanish control until the early 19th century, when it joined other Central American nations to declare independence. In 1823, it established itself as a separate nation. By the 1900s, Costa Rica was a democratic society with an established infrastructure, public education system, free elections (for white males only), and a growing economy based primarily on coffee production and export. Bolstered by the construction of a railroad system in the 1880s, the cheap labor of Afro-Caribbean and Chinese migrants, and investment from foreign corporations and governments, agricultural production and export continued to expand into the 20th century. Following social unrest and a brief civil war in the 1940s, a new constitution was adopted in 1949. This signaled an era of peace, social progress, and civic participation that continues to be associated with the country.

Overview of Women's Lives

Costa Rica consistently ranks high on the Social Institutions & Gender Index (SIGI). It also scores well on the Gender Gap Index and, in 2013, ranked 31st out of 136 countries, received an overall score of 0.724 out of a possible 1.00, and earned particularly high scores in the areas of education and political empowerment (World Economic Forum 2013). In addition, legislation prohibits all forms of discrimination and promotes gender equality. There has also been significant attention to gender-related issues

due, partly, to the active women's movement. Yet, policies are not always enforced, and there is some resistance to changing gender roles. At present, gender norms in Costa Rica are in flux, a consequence of ongoing economic development as well as international tourism.

Girls and Teens

Costa Rica, with almost 40 percent of its population under the age of 24, can be considered a young country (CIA 2016). Females make up just under half of this population.

A recent survey of almost 10,000 adolescents ranked their foremost concerns as environmental damage, security, discrimination, arts, sports and recreation, poverty, and engagement (UNICEF 2015). Young people face additional concerns related to education, drug use, and domestic violence.

Despite these challenges young activists are making their impact felt. In one area, for example, the LGBTI rights organization Centro de Investigación y Promoción para América Central de Derechos Humanos (Center of Research and Promotion for Human Rights in Central America, or CIPAC) promotes cultural acceptance and knowledge about their community. Due to their and others' efforts, Costa Rica now recognizes May 17 as a National Day against Homophobia, and the Ministry of Education designates a day to educating students about homophobia and transphobia (Abelove 2015).

Education

Education is a priority and regarded as a means to promote social equality and the social and economic development of the nation. Gender has long been at the core of public and political discourse regarding education. In 1847, legislation established that the government had an obligation to provide equal education to males and females. Education was made free and obligatory for all Costa Rican citizens in 1869. Although considerable disparities in access were part of the educational landscape well into the 1980s, at present, access to education is good overall, and females have high rates of participation at both public and private institutions. Costa Rica is regarded as having achieved full equality in regard to gender and educational participation (World Economic Forum 2013). The overall adult literacy rate is 97 percent, and literacy rates are marginally higher among females than males (UNICEF 2013).

At the primary level, females and males enroll in school, attend school, and successfully complete their courses of study at similar rates. At the secondary and university levels, females have slightly higher rates of matriculation and degree attainment (INEC 2011; UNICEF 2014). Compulsory education includes a total of nine years: six at the primary level (with Cycle I includes grades 1–3 and Cycle II includes grades 4–6) and three years at the secondary level (Cycle III includes grades 7–9). Those who complete Cycles I–III and pass the national exam may elect to participate in a one- or two-year program, either technical training or academic/college prep. The school calendar includes two terms. Students generally take competency and proficiency exams at the end of each term. The school day in public institutions is typically four hours at the primary level. It is longer at the secondary level, up to seven hours.

School Completion and Dropout Rates

School completion and dropout rates remain a concern. Over 95 percent of Costa Ricans successfully complete primary school (UN Population Fund 2012). However, only 47 percent of those who begin secondary education successfully complete their course of study (Programa Estado de la Nación 2013). The national average for school attendance is 8.4 years. Although this represents a gain of more than 3 years of average schooling from 1980 data, it demonstrates that many do not complete the state-mandated educational requirement (UNDP 2013). At present, only 35.37 percent of adults have completed secondary school, and illiteracy rates are highest among adult populations, particularly those aged 45 and older (Aguilera 2013). There is a strong correlation between school completion and employment patterns: those with less education are overrepresented in low-paying jobs in the service and agricultural sectors (Monge-Naranjo 2007).

Adolescents from low-income families and rural communities are most likely to discontinue their education, and dropout rates are higher among males than females (Ocampo 2003). Among those female students who do drop out of school, reasons typically relate to economic pressures and the need to contribute to the household economy. In addition, while most communities do have an elementary school, secondary schools are concentrated in areas with higher populations (Monge-Naranjo 2007). The cost and time associated with transportation for children from rural communities can be a burden

and may contribute to dropout rates. Furthermore, teen pregnancy is an ongoing concern (Mainiero 2010). Teen mothers have high dropout rates despite various efforts to encourage them to stay in school (Parliamentary Confederation of the Americas 2009). Among indigenous students, the discriminatory treatment they encounter—such as nicknames, social isolation, and the sexual objectification of indigenous females—from nonindigenous classmates and teachers may threaten their resolve to stay in school (Stocker 2005, 141–168). Sexism, like racism, in school settings remains an ongoing concern, particularly in the form of gender stereotypes and sexist language in the approved public education curriculum (Osborne 2013).

Among those who do remain in school and take the exam that marks the completion of their compulsory education, females and males pass the exam at equivalent rates. However, students from low-income backgrounds and those attending rural schools are less likely to do so (Davis 2008). It has been suggested that this is due to the scarcity of schools and lower quality of instruction in rural public schools (Navarro 2014).

Health

Access to Health Care

Health is a priority in Costa Rica, and the average life expectancy is 78 years overall (75.59 years for males and 81.01 years for females), higher than other Latin American countries and comparable to industrialized nations (CIA 2014). Health care is provided to all citizens under a public system that covers provider fees and prescriptions. Citizens may also purchase private insurance and, in doing so, utilize the services of private providers and avoid the long waits associated with the public system.

Access to facilities and providers is much better in urban centers such as San Jose and Liberia, especially for illnesses and conditions requiring highly specialized care (such as cancer) or surgery. Public health programs, such as the introduction of paramedics, vaccines, nutrition programs, sanitation programs, and oral health initiatives, have expanded in recent years, particularly in rural areas, and have contributed to improved overall health in Costa Rica. So-called alternative or natural remedies are widely accepted in Costa Rica, and it is common to incorporate herbal and homeopathic remedies as well as acupuncture, chiropractic, and religious rituals into health care practices (Biesanz et al. 1999).

Maternal Health

Costa Rica's maternal mortality rate (MMR), the annual number of deaths per 100,000 live births, was estimated at 25 in 2015, down from 40 in 2010 (CIA 2016). During pregnancy, 97 percent of women visit a health care provider four or more times and at 99 percent, almost all women have a skilled health care provider present while giving birth (UNICEF 2014). Breastfeeding is not very common, as just 18 percent of women exclusively breastfed their children for up to six months during 2008–2012 (UNICEF 2013). To support and encourage women who do choose to breastfeed, about 50 women staged a “mamaton” protest, where they publicly breastfed in a mall after mall personnel had asked a woman to use a lactation room rather than nurse in public. President Laura Chinchilla shared her support by calling the mall's action “unjust.” Along with other supporters, she advocates for women to nurse, and by doing so, she promotes upholding Chile's current law that mandates time for mothers to nurse or pump breast milk (Associated Press 2013).

Diseases and Disorders

Dengue fever and chikungunya are of significant concern, as due in part to climate change, they have each recently spiked, according to Costa Rica's health minister. Dengue cases were recorded in 73 of 81 cantons and chikungunya in 45 (Arias 2016). Cancers and cardiovascular and other noncommunicable diseases are the causes of 83 percent of total deaths (WHO 2016). Alcoholism is an ongoing concern, and rates of tobacco use are increasing.

Sexual and Reproductive Health

Maternal mortality and morbidity rates in Costa Rica are among the lowest in Latin America and comparable to rates found in some industrialized nations (World Bank 2014). Contraceptive use is widespread, and approximately 81 out of 100 partnered heterosexual women of childbearing age use oral contraceptive pills. Females typically have their first sexual experience between the ages of 15 and 20. Their first sexual partner is, on average, 11 years older, and nearly 60 percent report not using contraception during their first sexual intercourse (Social Watch 2014). The rural province of Guanacaste has the highest rate of genital chlamydia trachomatis infection in the country and one of the highest in Latin America, with 14 percent of young women ages 18–25 testing positive. Infection rates

are higher among women who are unmarried, use intrauterine devices, are less educated, and have multiple sexual partners (Porrás et al. 2008).

HIV infection rates remain relatively low in the country, but they are steadily increasing, with gay men and sex workers experiencing the highest known infection rates. Infection rates are believed to be underreported (Sullivan 2006). The continuous ebb and flow of international tourists, particularly those who seek pleasure among traditional sex workers and the growing number of female tourists who form short-term romantic and sexual relationships with locals, is also a factor in the transmission of sexually transmitted diseases (STDs) (Romero-Daza and Freidus 2008). Teen pregnancy rates are also an ongoing concern, and births to teen mothers account for 20 percent of all births. Rates are highest in rural areas, are often associated with sexual abuse and domestic violence, and have raised concerns about illegal abortions (*La Nación* 2013).

Gender-Based Violence

Violence against women continues to be widespread in Costa Rica. In a 2004 survey of ticas, nearly 60 percent of participants indicated they had experienced sexual or physical violence during their adult years, and perpetrators were most often male family members or close acquaintances (Sagot and Cabañas 2010). Despite legislation that prohibits domestic violence and Costa Rica's ratification of the Convention on the Elimination of All Forms of Discrimination against Women (CEDAW) and other international and regional agreements that include provisions regarding violence against women, there is a cultural attitude of acceptance about such matters, and laws are often not enforced. Critics point to gender socialization and the cultural social hierarchy of gender as key factors in the perpetuation of such violence (Sagot and Cabañas 2010).

Violence against women in Costa Rica takes a variety of forms, including domestic violence, sexual abuse, marital rape, sexual harassment, forced prostitution, attacks on migrant women, torture, and femicide (Fabrikant 2003). Gender-based violence also includes attacks on and murders of members of the LGBTIQI community, individuals who are regarded by many as nonconformists or as violating gender norms (Lester 2012).

Human trafficking is also an ongoing concern, and rates are increasing. Costa Rica serves as both an origin point and destination for human trafficking victims. Many victims are also trafficked through Costa Rica on their way to

other countries in the region. Young women and children are most often the victims (the average age of victims is 12 years old), and while some are trafficked for labor or as part of the illegal international adoption trade, most are trafficked into urban areas to work in the country's sex industry (Protection Project 2014).

Employment

Gender Equity in Employment

The World Economic Forum (2013) ranked Costa Rica 29th of 132 countries in overall gender equity, but only 99th in the category of "Economic Opportunity and Participation." Gender-based discrimination is pervasive in the realm of employment, including in hiring, pay, promotion, and treatment of workers (United Nations 2003). Women's employment has steadily increased over the past two decades, and nearly half of all women work for wages, including residents and immigrants, both legal and illegal, and comprise over 40 percent of nonagricultural workers (World Bank 2014). Only one-third of female workers have attended college or technical school, 20 percent attempted but did not complete secondary-level education, and nearly 10 percent attempted but did not complete primary school (Monge-Naranjo 2007).

Regardless of educational attainment, women continue to participate in the labor force at rates lower than males. Nearly one-fifth of working women are considered to be "vulnerable" and to experience unsafe or difficult working conditions, to have informal working agreements, or to be unpaid family workers. Women also face higher rates of unemployment: 10.5 percent compared to the overall unemployment rate of 7.6 percent (World Bank 2014).

Inequality and Disparities in the Workplace

Occupational segregation by gender is widespread. Some regard this as the result of traditional gender norms that discourage women from participating in particular fields (Osborne 2013). Females tend to be concentrated in the service sector, including as domestic help, child care workers, and especially tourism. The female labor force is distributed as follows: 85 percent in service, 11 percent in industry, and 4 percent in agriculture. In addition, women comprise one-third of the total workforce and half of the informal sector workforce (World Bank 2014).

The labor market is further segregated along racial and ethnic lines. Afro-Caribbean women living in the area of

Limón are concentrated in caretaking fields such as nursing and teaching, while their white counterparts work in industries. Wages for teachers and nurses are typically higher than wages for industrial work, but Afro-Caribbean women are more economically vulnerable if social services budgets are reduced (McIlwane 1997). Similarly, Nicaraguan immigrant women—both legal and illegal—are concentrated in the informal sector, including housekeepers, laundresses, cooks, and nannies (Gindling 2008). These jobs carry low status and low wages, may provide only intermittent and inconsistent income, and do not provide opportunities for advancement (Osborne 2013). Indigenous women tend to be concentrated in the informal labor sector (Vinding and Kampbel 2012). Those indigenous women that do engage in formal-sector employment are likely to find themselves overrepresented in the agricultural industry, specifically on fruit plantations, where exposure to pesticides may diminish their respiratory health (Feitan et al. 2009).

The gender wage gap persists and is more pronounced in the private sector than the public (United Nations 2003). When employed in the same fields, men tend to earn more than women, particularly in agricultural work, finance, health care, education, social work, and the hospitality industry (Tijdens and Van Klaveren 2012). Although the wage gap appears largest for those who face barriers in the attainment of skills, education, and training, it persists even when employees have comparable traits in these areas (Monge and Gonzalez 2005). In labor fields with the highest level of gender disparity, white males disproportionately occupy supervisory positions (Council on Hemispheric Affairs 2013).

Legislation such as the Law for Promotion of Women's Social Equality and the Law against Sexual Harassment in Employment and Teaching promote gender equality in the workplace. Yet, they are not always enforced. In addition, aspects of labor laws may disadvantage female employees. Article 88 of the Law for Promotion of Women's Social Equality restricts women in most fields from late-night work. This effectively bans women from higher-paying shifts or in jobs such as call centers (World Bank 2014).

Recent Changes in the Costa Rican Economy and Labor Market

During the past three decades, the transition from an economy based primarily on agricultural exports to an

economy of service and industry has led to economic growth and the expansion of the middle class. The country's economy was primarily based on agricultural production and the export of coffee, banana, pineapples, sugar palm oil, cocoa, and beef during the 20th century. In the three decades from 1950 to 1980, there was sustained and healthy economic growth.

This economic growth came to an abrupt halt with the economic crisis of the 1980s. The crisis was the result of a combination of factors. These factors included a monoculture economy of dependent capitalist production that relied primarily on agricultural exports. Other factors were increasing reliance on technology, increasing expansion of the middle class, the growth of consumption and importation, the lingering ripple effects of the international economic crisis of the 1970s and the resulting Structural Adjustment Programs (SAPs) promoted by the World Bank and the International Monetary Fund (IMF), the influence of foreign multinational corporations, and Costa Rica's "chronic and growing deficit" (Mas 2004, 217). Consequently, the economy plummeted. The colón, Costa Rica's currency, was devalued. GDP dropped by more than 50 percent, salaries decreased an average of 40 percent, and one-tenth of adults were unemployed. Inflation soared to over 80 percent, and national debt increased threefold, making it nearly equivalent to the country's GDP (Seligson and Muller 1987).

At present, the majority of workers are employed in the service industry, particularly in jobs related to the thriving ecotourism industry, which is the country's primary employment sector and income generator. Agriculture remains a significant employment sector, although this has decreased as the service sector has continued to expand. There is also an expanding industrial sector that includes electronics components, textiles and apparel, medical devices (such as heart valves), plastics, chemicals, and wood-related manufacturing (such as furniture or the processing of wood for construction purposes). The creation of a commercial corridor near the capital of San Jose has supported continued growth in this area. Call centers and other telephone-related service jobs are currently on the rise. Similarly, employment related to medical tourism continues to increase as more and more individuals from North America travel to Costa Rica to undergo procedures at a fraction of the cost, especially dental procedures (Warf 2010) and cosmetic surgery (Ackerman 2010). While most labor takes place in the formal sectors identified above, there is also an extensive informal labor market.

Labor Laws and Employee Rights

Costa Rica's Código de Trabajo (Labor Code) includes numerous provisions intended to protect workers and promote their well-being. These include a minimum-wage scale that is updated biannually, may be established as a minimum per day or per month, and varies in amount depending on the job classification (Ministerio de Trabajo y Seguridad Social 2014). Employees are also guaranteed the right to paid vacation and paid holidays as well as sick leave. The maximum length of workday is also legislated, and employers are required to provide coverage for employees in the event of injury or job-related disability. In May 2014, the Social Security System board of directors voted unanimously to extend all social benefits to same-sex couples employed in the public sector, including employment-related benefits such as health insurance and pensions (Pomareda 2014).

Maternity leave includes a total of 120 days of paid leave, with the employer and the Social Security Administration each paying half of the employees' salary during this time. Maternity leave typically begins 30 days prior to the birth. It continues for an additional 90 days postpartum, a period that coincides with cultural beliefs about the importance of breastfeeding and the minimum length of time an infant should be breastfed following birth. Paid maternity leave can be extended for health reasons and with proper documentation from a health care provider. Fathers employed in the public sector are entitled to 8 days of paid paternity leave. Women who continue to breastfeed after returning to work are permitted breaks to breastfeed their child or to express breast milk. These breaks are, at minimum, 15 minutes for every 3 hours of work or two 30-minute breaks for a full workday. Labor unions are legal and widespread.

Despite these provisions, the attempts at union busting that began during the economic recession of the 1980s have continued into the 21st century (Banana Link 2003). In addition, labor code violations are common (ILWU 2010). Child labor is also a concern, particularly in the areas of domestic and agricultural labor. Child labor includes both voluntary and forced labor from native-born children as well as those who enter the country as migrants or as victims of human trafficking (U.S. Department of Labor 2012).

Family Life

Family life is a central feature of Costa Rican society. Children are regarded as treasures or blessings, and there is

no strong son preference. Newborns are given two last names, one from each of their parents, in the tradition of bilateral descent. Family gatherings are common, including for celebrations, holidays, and family dinners and typically include extended families. Adults who do not have children may be pitied. Likewise, individuals who are not close with their families are often regarded as peculiar.

Changing Family Dynamics and Household Composition

Traditional family life included distinct gender roles, something that was heavily influenced by the Catholicism found throughout the country and presence of attitudes of machismo and patriarchy. The father was the breadwinner and head of the household, while the mother was chiefly responsible for domestic duties such as cleaning, cooking, and childrearing. Women of the middle and upper classes typically hired lower-income women to do their household labor, a practice that is still common. Yet, the dynamics of the family are rapidly changing in Costa Rica, both in regard to family composition and gender roles. Marriage and fertility rates are declining. Rates of divorce and separation, the number of female-headed households, the number of single mothers, and the number of people living alone have all increased (INEC 2011).

In addition, as Costa Rica has been increasingly drawn into the global economy and as the tourism and industrial sectors have expanded, employment opportunities for women have also expanded. More women are working for wages and contributing a greater share to the household economy and national economy than previous generations (Monge-Naranjo 2007). While women and youth tend to support women's increasing economic role, older adult males are more likely to associate these changes with "family breakdown" and express concern over changing gender dynamics (Chant 2002). Among young men, changing gender dynamics may demand that they negotiate their own gender identity and sense of masculinity in ways that may be uncomfortable or unfamiliar (Chant 2001, 204–207; Mannon and Kemp 2010).

Similarly, changing gender norms may leave young women feeling caught between traditional and contemporary gender ideologies. For example, despite their increasing economic and decision-making roles within the family, women are still expected to be altruistic and self-sacrificing (Brickell and Chant 2010). Additionally, older women express concern about what they perceive to

be younger, professional women's diminished skills in the areas of housekeeping and especially the preparation of traditional foods such as *gallo pinto*, a rice-and-bean dish (Preston-Werner 2008).

Female-Headed Households and Single Mothers

Since the late 1990s, there has been a steady increase in female-headed households. This coincides with increasing rates of cohabitation and declining rates of marriage (Esteve et al. 2012). It also coincides with increasing rates of births to unmarried women, which account for approximately one-half of all births (Palmer and Molina 2004, 361). Female-headed households comprise 27 percent of all households, 33.5 percent of all poor households, and 43.5 percent of households in extreme poverty (Chant 2009). Single mothers and their children experience poverty more than any other type of household (Gindling and Oviedo 2008). Social ostracism, low self-worth, and physical or sexual abuse from former partners and extended family members are common among single mothers (Budowski 2005, 18-19).

The 1998 Law for Women in Conditions of Poverty provides job training and personal development courses for single mothers. The Act on Services for Women Living in Poverty of 1998 established programs for poor women and an economic stipend for participants. Various child care programs have been created to assist single mothers. However, demand for such services far exceeds availability (Gindling and Oviedo 2008). The 2001 Law for Responsible Paternity requires mandatory DNA testing in cases where paternity is not voluntarily acknowledged. It also requires the father to grant the use of his surname and to pay pregnancy-related medical costs and food expenses for the child's first year of life (Barash 2012). However, mothers pursue DNA testing in only about one-third of cases (Budowski and Bixby 2003).

Politics

Costa Rica is a constitutional democracy with three branches of government that operate via a system of checks and balances. Universal suffrage was established in 1949, and voting is mandatory for all citizens aged 18 and older, although only about 75 percent of eligible voters participate (International IDEA 2014). Citizens are generally well-informed about political matters. The political climate of the country has long been dominated

by discourses of democracy and human rights as well as an eye toward ongoing economic and social development. Internationally, the country has peaceful political relationships, including with its Central American neighbors with whom it has advanced an agenda of diplomacy. Recent examples include President Luis Alberto Monge's proclamation in 1983 affirming Costa Rica's status as neutral, despite pressure to become involved in the war in Nicaragua, as well as President Oscar Arias Sánchez's efforts to promote democracy among Central American nations, efforts that earned him the Nobel Peace Prize in 1987. In the 21st century, Costa Rica also developed a strong relationship with China.

Promoting Women's Equality

Costa Rica ranks 21st out of 136 countries in regard to women's political empowerment (World Economic Forum 2013). The 1949 constitution affords equal voting rights and political representation and prohibits discrimination in any form. In recent decades, laws have promoted gender equality in the areas of parental authority, marriage and divorce, bank loans and financial services, ownership of land and property, and protection from domestic violence, rape, and sexual assault. In addition, a variety of entities have been created to promote women's equality and the status of women in Costa Rica. These include the National Center for the Rights of Women and the Family and the National Women's Institute. Costa Rica also ratified the UN Convention on the Elimination of All Forms of Discrimination against Women (CEDAW) in 1986.

In response to concerns about the scarcity of women in politics, a quota system for candidates was enacted in 1988. It requires that women are 50 percent of candidates for political office and that female and male candidates be listed in alternating order on ballots. Women currently hold one-third of seats in the national legislature, and several serve in cabinet posts (Quota Project 2014). From 2010 to 2014, Laura Chinchilla Miranda served as the first female president of Costa Rica. Despite these achievements, female politicians continue to experience marginalization and to be relegated to the realm of women's issues (Schwindt-Bayer 2006). The women's movement in Costa Rica has been active and vocal, taking on a variety of public and personal issues. In the 1990s, various components of the women's movement sought to promote gender equality through a "revisioning" of Costa

Rican history to incorporate women, combating violence against women, promoting women in the arts and education, advocating for legal equality, and expanding women's leadership in politics, business, and finance (Leitinger 1997, 5–12).

Religious and Cultural Roles

The influence of Roman Catholicism is felt throughout Costa Rica, although it would be an overstatement to suggest that religion dominates life. Churches are found in the center of most communities, and many cities are named after saints. It is common to attend weekly religious services or to attend church for religious celebrations such as Christmas, Good Friday, and Easter, but only a small portion—typically older generations, especially women—attend services or visit a church to pray on a daily basis. Thus, while religion does have a presence in Costa Rica, it does not dictate gender roles.

As a historically male-dominated society, Costa Rica still exhibits aspects of machismo that are common in other Latin American cultures, and the notion of females and males as fundamentally different from one another remains strong. Sexual harassment is common, both in employment and in public places, such as on the street, in parks, and on public transportation. Females employed in business, finance, and other sectors traditionally dominated by men can expect to encounter sexual harassment and may find their ideas dismissed or treated as inferior simply because they are female. In addition, female bosses may face challenges to their authority from male subordinates.

These behaviors stem, in part, from the lingering belief that women's appropriate roles are as wife and mother, and males should be breadwinners and the heads of the family. Yet, cultural gender roles are in flux, particularly as more young women continue to pursue higher education and enter the professional workforce. In addition, changing family composition due to increasing divorce rates and increasing incidence of births to single mothers has challenged traditional gender roles. Some regard this as beneficial and a positive move away from the restrictions placed on males and females of earlier generations. Yet, there is much concern over how such changes may contribute to a cultural crisis, particularly by emasculating men and causing women to abandon traditional family values (Mannon and Kemp 2010, Preston-Werner 2008).

Issues

Social Exclusion and Marginalization

Social exclusion and marginalization persist for many groups in Costa Rica, including indigenous communities, individuals of Afro-Caribbean descent, and immigrant populations. There are eight indigenous groups in Costa Rica, including the Maleku, Bribri, Chorotega, Huetare, Cabecare, Terraba (or Teribe), Boruca (or Brunca), and Guaymí tribes. Persecuted, raped, and murdered by colonizers and missionaries, these tribal communities managed to survive, albeit in dramatically reduced numbers and with significant loss of ancestral lands. Most now live on reserves scattered throughout the country. Although protected under Costa Rica's *Ley Indígena* (Indigenous Law) of 1977, they face ongoing threats to their sovereignty and land rights (Duquaine-Watson 2013; Forest Peoples Program 2013). Indigenous females experience higher rates of poverty, food insecurity, and illiteracy; have poorer health; and are less likely to complete primary education in comparison to nonindigenous women and indigenous males (Herforth 2007; Vinding and Kampbel 2012). Afro-Caribbean populations, especially from Jamaica, arrived in Costa Rica in the late 19th century and were welcomed as a source of cheap labor. Some have criticized the mainstream women's movement for failing to include the voices of Afro-Caribbean women and failing to attend to the ways in which their experiences are shaped at the intersection of sexism, racism, and classism (Foote 2004). In addition, Afro-Caribbean women continue to face stereotypes of hypersexuality and presumptions of biological differences that are a legacy of earlier centuries (Putnam 2002, 16).

In recent decades, many citizens of other Central American nations have immigrated to Costa Rica. Some arrived as refugees during periods of civil war, while others migrated with the hope of finding better job opportunities. Whereas immigrants from the United States and Europe continue to be welcomed and to be associated with wealth and economic opportunities, those from Nicaragua, Guatemala, and El Salvador are likely to experience disdain, hatred, and even violence (IDRC 2013; Mayer 2010). Immigrant women often find themselves relegated to the realm of domestic labor and are subject to long hours, low pay, and physical or sexual assault. They also struggle to resist assimilation and to raise their children with their own cultural values and identity (Quizar 1998, xvi).

Maleku Women

The Maleku indigenous group includes approximately 700 individuals who live primarily on the Guatuso Indigenous Reserve in northern Costa Rica. The Maleku were quite successful in resisting conquest and colonization (Castillo Vásquez 2005). At present, they continue to rely on hunting, fishing, and subsistence agriculture. They maintain their own language, belief system, and traditions. However, like other indigenous groups in Costa Rica, the Maleku are being increasingly drawn into the country's commercial economy due to persistent, pervasive poverty as well as continuing assaults on their rights (Duquaine-Watson 2013).

Traditionally, women were responsible for gathering activities, household tasks, and child-rearing while men hunted. However, these roles were regarded as complementary. Large families were common until the 1970s, although now it is more common for Maleku families to have two or three children. At present, women continue to perform the majority of household labor and child-rearing, but they also work alongside men in agriculture, animal husbandry, the construction of homes and community structures, the creation of cultural artifacts such as masks and drums for sale, and the operation of souvenir shops. It is increasingly common for young adult women to work for wages, especially in jobs within Costa Rica's tourism industry.

The community has its own tribal council, and approximately half of council members are women. Female children are given the same educational opportunities as males and are encouraged to participate in extracurricular programs, such as athletics, arts, and personal development. In 2014, there was considerable pride among community members when a young Maleku woman was selected to represent Costa Rica at the Football for Hope Festival. This event was held in Caju, Rio de Janeiro, Brazil, in conjunction with the FIFA World Cup. Participants were chosen because of their leadership skills, contributions to their communities, and athletic ability.

—Jillian M. Duquaine-Watson

Conclusion

Despite Costa Rica's diminutive size and its classification as a developing nation, the lives of women in the country are positively impacted by many factors. These factors include the country's dedication to providing social services—such as health care and education—for its citizenry as well as its steadily expanding economy. Overall, women in Costa Rica fare well in educational access and completion rates as well as political representation and participation. The discourse of women's rights in the country has expanded in recent decades, and this has promoted increased attention to gender equality, something that is reflected in federal legislation that prohibits gender discrimination. Quite simply, gender equality seems to be one component of broader discourses of democracy and human rights that are central to contemporary tico society.

Yet, there remains a gap between the promise of gender equality and the reality of women's lives in the country. Put another way, the ideology that supports gender equality does not necessarily translate into practice. This is reflected, for example, in gender disparities in employment and the ongoing and widespread problem of gender-based violence. Furthermore, it is clear that the needs

and experiences of women from socially marginalized groups—especially indigenous, immigrant, Afro-Caribbean, and low-income populations—have yet to be mainstreamed in the national gender agenda. As the country continues to promote economic development, industrialization, and foreign trade in the 21st century, it will be interesting to note the role that gender is afforded in its political and economic plans. Such plans have the potential to advance gender equality. Conversely, they could also reinforce and even exacerbate current issues facing women and girls throughout Costa Rica.

CUBA

Overview of Country

Cuba is located in the Caribbean Sea, between Mexico's Yucatan Peninsula approximately 100 miles to the west and the island of Hispaniola (shared between Haiti and the Dominican Republic) 45 miles to the east. The island is approximately 93 miles south of Key West, Florida, and has a geographical area of 42,903 square miles (CIA 2014). Cuba's rich history extends back to around 8000 BCE, with the first of several groups of migrants from the mainland settling on the western side of the island. The indigenous tribes on the island, the Taíno-Arawaks, survived the arrival of the Spaniards and still inhabit remote areas of the Cuban countryside. Since the arrival of the Spanish in 1492, however, population demographics have shifted drastically due to Spanish immigration, indigenous genocide, and large-scale use of African slave labor on sugar and tobacco plantations.

The Spaniards brought with them a fervent Catholicism and a traditional Western European sociopolitical

hierarchy, within which women of all social classes were considered property, although some held more value than others, meaning that upper-class women of European heritage were not literally bought and sold like their African counterparts.

After the Spanish-American War (1898) and with help from the United States, Cubans won their independence from Spain in 1902. Between independence and 1959, Cuba was governed by authoritarian dictators, the last of which was Fulgencio Batista y Zaldívar (1901–1973). Batista was a strong supporter of economic investors from the United States, and they returned the favor by supporting his run for power. Batista was forcibly removed from power on January 1, 1959, in a guerilla revolution led by Fidel Castro Ruz (1926–2016).

Upon gaining power, Castro, along with the various incarnations of what would eventually become the Communist Party of Cuba (*Partido comunista de Cuba*, PCC), enacted radical sociopolitical changes on the island, including securing funding by the Soviet Union for the new Cuban government. Another drastic change was to expel all capitalist enterprises from the island, many of which were highly lucrative for U.S. citizens. The negative economic consequences for these U.S.-based corporations, combined with rising U.S.-Soviet tensions, led to the U.S. strict trade embargo in 1961. Despite Castro's opposition to imperialism, including the Soviets, the economic hardship that would have befallen the island was narrowly avoided because of Soviet support of the Cuban Revolution (Taaffe 2005). The Soviet Union continued its economic and political influence until the fall of the Berlin Wall and the collapse of the USSR in 1991, when Cuba was effectively cut off from Soviet support.

At this point, Cuba entered what is known as the "Special Period in Peacetime." This *período especial*, which spanned most of the 1990s and has many lingering effects today, marked the downturn of Cuban politics and was characterized by severe economic hardship and food shortages. In the new millennium, Cuba has, to a small degree, pulled out of this economic slump, but not without significant change. In 2006, concerns for Castro's health called for his younger brother, Raúl (1931–), to take power. Raúl had previously served as minister of the Revolutionary Armed Forces. This change in leadership, combined with Raúl's decision to step down in 2018, has signaled what many predict to be the end of Cuban socialism. Cuba is also undergoing changes due to President Barack Obama's (1961–) decision in 2014 to normalize U.S.-Cuban

relations through policy changes and President Donald Trump's (1946–) efforts to subsequently eclipse this policy change.

Cuba's population of 11,271,000 is composed of three primary ethnic categories. As of 2012, 64 percent of Cubans identify as white, 27 percent are mestizo (of mixed ancestry), and 9 percent identify as black (CIA 2014). Due to the common misconception that indigenous populations have been all but eliminated, they are continuously not calculated as an ethnic group. However, surviving indigenous communities living primarily on the eastern half of the island have since become more visible and active in challenging this notion. Enslaved Africans were brought to Cuba primarily from West Africa, although the active trade across the African continent resulted in multiple points of origin and therefore brought various cultural and religious influences.

Despite limited access to technology, the Cuban health care system is one of the best in the world, and life expectancy at birth is 76 years for men and 81 years for women (World Bank 2012). The infant mortality rate, which measures how many children die per 1,000 born, is lower than that of both the United States and Canada. Education is compulsory until age 16, and 99.8 percent of both men and women are literate. Seventy five percent of Cubans live in cities, the largest of which is the capital, La Habana (Havana), with 2.1 million inhabitants (CIA 2014).

Prior to the revolution in 1959, 85 percent of Cubans identified as nominally Catholic, although the practice of Catholicism was, and still is, syncretic, or heavily influenced by African and indigenous practices, the most notable of which is Santería (U.S. Department of State 2011). When the Castro regime took control of the government, practicing organized religion was widely discouraged, although the government has since relaxed this stance. According to Article 8 of the 1976 Constitution, "The State recognizes, respects, and guarantees religious freedom." Despite this legal protection, religious discrimination still occurs.

Overview of Women's Lives

Because of the socialist revolution, women have become essential participants in the labor force and political structure, although there is still more progress to be made for women to achieve economic and political parity. The Federation of Cuban Women (FMC) spearheaded a literacy campaign shortly after the revolution that increased the

literacy rate in rural parts of the country from 41.7 percent to nearly 98 percent in just two years (Center for Democracy in the Americas 2013, 16). In Cuba, education and health care are considered "helping professions," and, as a result, they are frequently dominated by women (American Association of University Women 2011). While there are still inequalities that must be addressed, women in Cuba have made significant progress in their struggle for equity.

Cuba's island location means that its indigenous history is similar to that of surrounding islands, namely, Hispaniola (shared between the nations of Dominican Republic and Haiti) and Puerto Rico, a commonwealth of the United States. The primary indigenous group that has populated these islands since before the arrival of the Spanish in 1492, the Taíno, is matrilineal, with family lines traced through women. Additionally, Taíno women share an equal social standing to men and are often tribal leaders.

Girls and Teens

One of the primary goals of the 1959 revolution was to promote gender equality. To that end, Cuban women are consistently encouraged from a young age to actively participate in the workforce as well as the government. Unfortunately, residual sexism means that this encouragement is paired with double standards and expectations that women will also maintain the household. Young girls are, according to statistics released to international organizations by the Cuban government, educated at an equal rate and level of quality as their male counterparts (World Bank 2012). They have numerous strong female role models within the government, and their health and well-being are said to be central national priorities. While their lives are not free of challenges, a majority of Cuban girls face fewer systemic obstacles than they might in other Latin American or Caribbean countries.

The Cuban education system has been hailed as one of the best in the Americas, but it is not without shortcomings. The government spends 12.8 percent of its gross domestic product (GDP) on education each year, second only to Lesotho (CIA 2014). All children are able and required to attend school through ninth grade, although some say that the curriculum is heavily indoctrinated with nationalistic propaganda (Sánchez 2011, 44). Even children in rural and remote regions of the country are able to attend school. The Center for Sexual Education (CEN-ESEX) ensures that comprehensive, age-appropriate sex

education begins early and covers topics such as sexual abuse, LGBTQ+ sexuality, HIV/AIDS, contraception, and abortion. Many Cuban adolescents study at university, where women make up a majority of the student body. All students receive training in subjects from medicine to engineering, and women form the majority in numerous employment fields.

When they are not in school, children frequently play baseball, Cuba's national sport, in the streets and fields. There are no restrictions on which activities girls are allowed to engage, but because of limited access to resources, all children must be creative when playing. A government initiative, the *Plan de la calle* (Street Plan), makes use of the tendency of most children to play in the streets and has created resources and training to focus these games on learning skills and encouraging good habits. Some of these activities include homemade kites, dolls, and role-playing games (Cuba Sport 2011; EcuRed 2013). Another popular game among Cubans is dominos, which is often played on sidewalks or in the street. While there are fewer cultural restrictions around women playing dominos, domestic and professional demands placed on women often limit the frequency with which they are able to play.

While the legal code mandates gender equality, pre-revolution cultural expectations persist. Unspoken norms continue to dictate that women and girls will assume the majority of domestic tasks, such as laundry and food preparation. Similarly, while the government-regulated education, legal, and health systems encourage sexual equity and responsibility, many argue that girls are often more socially restricted than boys. There are numerous groups to educate adolescents about their health and sexuality (e.g., Soy Cuba, CENESEX). As of 2011, 74 percent of Cuban women reported using, or having a partner who uses, some form of contraception (WHO 2016). There are no age restrictions or patient costs for access to contraceptives or abortion services, although there are frequent complaints about a lack of medical supplies.

Health

Health care in Cuba is, according to the constitution, free and comprehensive for all citizens, although the cost of medical supplies and medications has become prohibitive for many Cubans. Even without supplies or medications, innovative health care professionals have maintained a surprisingly high level of care for the patients they do see.

Grandes Ligas

In the mid-1940s in Cuba, women started to play baseball. They wanted to play the same sport as men—playing “hard ball” instead of softball. They wanted to train with the men's team. Their love of the sport was met with much controversy because people felt that young women and girls needed to “play with dolls so that they know they are different” and that baseball is a “man's sport.” This level of gender inequality did not stop young women and girls from enjoying the national Cuban sport. In 2003, the Federation of Cuban Women called on its membership to organize baseball teams. This call started a wave of women's baseball teams across Cuba.

The documentary *Grandes Ligas?* is set in 2013, and the Havana team is preparing for the annual March 8 Cup, the only official women's baseball tournament. Even at this all-female sporting event, the players are expected to have their nails and hair done in a “feminine” manner.

Medical education and training are largely responsible for this, and Cuban doctors are sent abroad to countries such as Angola and Venezuela to treat patients who do not have access to affordable or safe health care (Jones 2009, 389). In late 2014, Cuba sent medical professionals to West Africa to help in providing care for the deadly Ebola epidemic there.

Access to Health Care

Cuba has significantly more doctors per capita compared to other nations in the Global South, most of whom are women (World Bank 2014). The biggest challenge for women is a lack of medical supplies and technology. Patients are often required to bring their own makeshift supplies, including clean linens, gloves, and medications (Sánchez 2011, 81). This is largely due to the economic downturn of the 1990s, the lack of industrial production capabilities, and an inability for the government to import such supplies. While criticisms of the state of affairs in Cuba are numerous, their health care outcomes are, nonetheless, distinct in the region.

Maternal Health

The health care system provides high-quality care for women. Statistics about infant and maternal mortality rates suggest that maternal care in Cuba is on par with or more successful than several nations in the Americas, including the United States (CIA 2014). Women receive up to 12 prenatal exams and are allowed 18 weeks of maternity leave (WHO 2016). Infant mortality occurs at a rate of 4.7 deaths per 1,000 live births, comparable to many European countries, and 99.9 percent of births are attended by a skilled health care professional (CIA 2014; WHO 2016). Cuba's attention to maternal health has resulted in the World Health Organization's (WHO) finding in 2015 that the transmission of both HIV and syphilis from mother-to-child had been eliminated (WHO 2016).

Sexuality

Discussions of sexuality are not entirely taboo on the island, but residual conservative religious and cultural influences mean that the (hetero)sexuality of women and girls is sometimes more harshly scrutinized and regulated than that of men or boys. Girls are often more closely monitored, while boys are able to leave the house unaccompanied and with fewer rules about their behavior. As is the case in most other Latin American countries, the idea that girls need to be protected so that they remain virgins until marriage is widespread (Stephen 1997, 274). This is a lingering result of the strong, prerevolutionary Catholic influence, whereby a woman's value is often tied to her virginity and, after marriage, her childbearing and child-rearing capabilities. However, because organized religion was discouraged with the onset of the revolution, and women gained access to in-depth sexual education, contraception, and abortion, cultural views have slowly started to shift, and women's bodies are becoming less socially regulated.

Diseases and Disorders

Cuba boasts an impressively low HIV/AIDS infection rate, which, as of 2012, was at 0.1 percent (CIA 2014). This is in contrast to infection rates of up to 2.1 percent in neighboring Haiti; however, this anomaly has not come without a price. As HIV/AIDS was first coming to light in the 1980s, it was suggested that it might have originated on the neighboring island of Hispaniola. In response, the Cuban

government began mandatory testing of all citizens, followed by the indefinite quarantining of any infected individuals (Zonana 1988). As a result of this swift and drastic response, the infection rate remains low. But because the most common method of transmission is via men who identify as heterosexual while occasionally having sex with other men, lasting stigma against men who have sex with men has contributed to decreased condom use in such encounters (McNeil 2012).

The main causes of death include heart diseases and diabetes, various types of cancer, and noncommunicable diseases. High risk factors for disease include high blood pressure and obesity. Data from 2008 show that 28.7 percent of Cuban women have higher blood pressure than women in the Central American region (19.7%). At 27.5 percent, Cuban women are slightly less likely to become obese than women in the region whose risk factor is 29.7 percent, but they are more likely than Cuban men, as their risk of obesity is 13.3 percent. A rising concern in the region is the presence of the Zika virus, which has been found in Cuba (WHO 2016).

Employment

Cuba has two separate economies that function simultaneously. The initial economy runs on Cuban pesos, which are circulated only on the island. Convertible pesos, or CUCs, can be exchanged for foreign currency, including euros or dollars (which incur an extra fee meant to offset the loss in revenue caused by the U.S. embargo). They were introduced during the Special Period to boost the economy. Convertible pesos can be exchanged for Cuban pesos, but not vice versa, which means that people who are employed in the tourist industry and receive tips or payment in CUCs have more purchasing power than their government-employed counterparts. A thriving black market also contributes to economic disparity on the island, and it is not uncommon for law enforcement officials to turn a blind eye to this unregulated activity that caters to tourists. In many cases, Cubans who have family living off the island receive remittances, or have money sent to them from abroad, and therefore have a financial advantage, despite the common misconception that Cubans all earn the same income (Sánchez 2011, 61, 79).

One goal of the Cuban Revolution was to empower women and incorporate them into the labor force, a move predating the passage of women's rights in several other Latin American countries (Goodman 2009). During the

1960s and 1970s, many women were employed as teachers, and the Federation of Cuban Women led the charge to make Cuba the first Latin American country with a 100 percent literacy rate. Women traveled independently to rural areas with the goal of spreading literacy as well as promoting the new socialist government. After there was no longer such a need for the literacy brigades, many women returned home and began working as *amas de casa* (homemakers) or in lower-level positions within the government or industry sectors.

In the 1990s, however, the Special Period brought a drastic shift to the economic makeup. The Soviet Union's previous support of the Cuban economy disappeared, and subsidized employment fields, such as agriculture, collapsed or became prohibitively taxed (Cooper 2003, 80). Cuba's inability to produce its own food supply led to widespread hunger and a massive population migration from rural to urban areas. The USSR had also provided essential support for Cuba's petroleum consumption, which in turn fueled the agriculture and transportation industries. The food shortage became so drastic that the Cuban government turned to importing a majority of foodstuffs, and the cost for these imports made it impossible to invest in boosting its agricultural sector. Although there has been some improvement since the early 2000s, this catch-22 causes high food prices and forces women heads of household to sometimes work multiple jobs or operate within the black market.

The Cuban government keeps very close tabs on its citizens and their economic activities, purportedly to ensure that income remains relatively equal within a certain economic sector and to prevent illicit activities. It is not uncommon for women who have had little success finding government-approved work to resort to entrepreneurial endeavors to make ends meet. These side jobs can consist of delivering eggs or running errands for neighboring elderly citizens, and such jobs often enable them to contribute significantly to family income (Center for Democracy in the Americas 2013, 43). However, such jobs generally function outside of the regulated economy (i.e., on the black market), thereby potentially making many Cubans criminals for something as benign as selling eggs (Sánchez 2011, 32, 72). This is not to say that there is no violent crime on the island or that all black market activity is morally irreprehensible, but it does shed light on the fact that the vast majority of citizens, especially women, are forced into illegal activities as a result of stringent legal policies (Sánchez 2014).

As of 2014, Cuban women make up only 38 percent of the regulated labor force and are primarily employed in lower-level positions. They are, however, especially prevalent in certain fields, such as medicine, law, and education, which differs significantly from the workforce distribution in most other Latin American countries. Of the 38 percent portion of the workforce that women comprise, 8.4 percent work in agriculture, 11.5 percent work in industry, and 80 percent work in the service industry, which includes nurses, doctors, lawyers, and judges (Center for Democracy in the Americas 2013, 41-42). Because women have equal access to education but limited upward professional mobility, it is common for overqualified women to work in entry-level positions within their fields while their male counterparts occupy a majority of the managerial and high-ranking posts (American Association of University Women 2011, 4).

Working the "Double Shift"

Cuban women spend, on average, three times as long doing domestic labor and child care than men (Center for Democracy in the Americas 2013, 4). For women who also work outside of the home, spending additional time—that often adds up to nearly 40 hours per week—working in the home is dubbed the "double shift" because they work nearly two full-time jobs while only getting paid for one of them. This rigorous schedule is further complicated because of the scarcity of resources and the lack of reliable transportation in Cuba (Center for Democracy in the Americas 2013, 14). Public buses, known as *camellos* (camels) for their unique hump-like shape, often arrive late or not at all, leaving passengers to fend for themselves. For those who must travel long distances to their workplace or school, this can mean walking for several hours.

Despite the fact that women have had equal rights and educational opportunities since 1976, many Cubans still hold traditional views about gender roles, which dictate that women belong in the home and men in the workplace. As a result, many women still do not work outside the home, and those who do are often expected to balance both a career and domestic duties. Because of the scarcity of many resources, especially since the 1990s, women who work outside the home must often wake up before dawn to complete all of their daily tasks. With the lack of transportation infrastructure, this can include several hours of waiting for buses or walking, which significantly increases the length of a typical day.

Family Life

Despite the legal advances for women as a result of the revolution, traditional patriarchal gender roles are still quite common, especially concerning division of labor and gender violence. Most women are well educated and are legally permitted and encouraged to work outside the home. Even though the Family Code, passed in 1976, legally requires men to assume equal shares of housework and child-rearing, the general expectation is that women will be in charge of the housework, creating an additional barrier to their ability to enter the regulated workforce. Because housing is scarce, several generations of women often live under one roof, all of whom contribute to household tasks and family income. The prerevolutionary racialized class system, wherein, generally, the lighter a person's skin, the more cultural and financial capital they had, meant that many of the Cubans who had the financial means to emigrate after Castro took power were of lighter complexion and conservative political leaning. As a result, many of the Cubans who suffered the most during the postrevolutionary years, and especially during the Special Period, were Afro-Cubans or mestizo.

Domestic abuse and intimate partner violence still play an alarmingly large role in family life, despite legal advances made in the past half-century. That Cuban law allows all citizens equal rights has, in some cases, worked against Cuban women. For example, police have discouraged reporting domestic or intimate partner abuse because it would be one partner's defense against the other (American Association of University Women 2011, 6–7). Equal rights legislation was created under the pretense that it would empower women to speak out about violence, but lingering machismo has proved to be a hindrance to the initially well-intended policy.

Politics

Prior to the revolution, women were not formally involved in politics and only had influence on their male family members who were able to vote. According to Cuba's most recent constitution, ratified in 1976, women are afforded the same legal rights as men with regard to employment, education, political agency, and access to health care. The increased presence of women in Cuban government offers hope that circumstances for women all over the island will continue to improve.

As of 2014, women involved in Cuban politics outnumber those of any other nation, occupying 45.2 percent

of the parliament seats (WHO 2016). Several government-sponsored organizations are overseen or operated by women, including the Center for Sexual Health and Education (CENESEX), the Federation of Cuban Women (FMC), and the North America Department of the Cuban Ministry of Foreign Relations. Women in Cuba are far more visible within the government than in other spheres, which has both positive and negative implications. On the one hand, women are involved in much of the policy-making decisions and can advocate for their constituency. On the other hand, the presence of women in government has had little impact on societal change. The on-paper rights of Cuban women are not always reflected in their day-to-day experiences.

Political Dissent

The political system in Cuba is considered by many to be fraught with propaganda and corruption, and women have taken a central role in staging political protests as well as voicing dissent through art, writing, and music (Saunders 2009, p. 2). Many of these dissidents have immigrated to Europe, South America, or the United States for fear of the retribution they would likely face by staying on the island (Sánchez 2011, 57). One prominent voice that does emanate from within Cuba, a group called the Ladies in White, comprising “wives, sisters, and mothers of Cuban political prisoners,” has taken it upon itself to protest the unjust incarceration of their loved ones for their dissent toward the Cuban government (Las Damas de Blanco 2003). This group was started by Laura Pollan, whose husband was imprisoned in 2003 in a sweep that became known as the “Black Spring,” during which dozens of political dissidents, journalists, and “regime critics” were rounded up and put behind bars (Langer 2011).

Government Surveillance

In an effort to keep the socialist government in power and to preserve its positive reputation abroad, Cubans have very little privacy or freedom when it comes to communication and political dissent. Nearly all correspondence is intercepted and read, and plainclothes police are prevalent, making Cubans wary of where and when they may criticize the government (Sánchez 2011, 18). Only 5 percent of Cubans have access to the Internet, and in most cases, it is only in the form of a closed network, or intranet, meaning that foreign sites are rarely accessible

(Franceschi-Bicchierai 2013). Presently, the government still holds the ultimate authority about what sites are available and has blocked most sites of political dissenters. Because Internet access is not available in homes and most Cubans do not have personal computers or mobile phones with international capabilities, communication with people off the island is extremely difficult. Tourist areas are the most common locations for Internet access, but the cost per minute is almost exclusively in CUCs; thus, Cubans whose earnings are in regular Cuban pesos or who do not receive remissions from family or friends abroad are only able to afford a few minutes of Internet access each month (Sánchez 2011, 219–220).

Religious and Cultural Roles

Prior to the arrival of the Spanish, indigenous Cubans practiced tribal religions, some of which remain. When Spanish conquistadors infiltrated the island, however, they forced conversion to Catholicism upon indigenous communities and outlawed the practice of traditional indigenous religions. During the 16th and 17th centuries, the influx of enslaved Africans resulted in the Spaniards once again forcing conversion on a subordinate population. The magnitude of the slave trade led to a slow but distinct blending of Catholicism with traditional African religious practices. The majority of enslaved Africans in Cuba originated from the Yoruba tribe in present-day Nigeria, and the religious tradition that resulted from the mixture of Yoruba beliefs with Catholicism is known as Santería (in Spanish, “the way of the saints”). It is estimated that up to 80 percent of Cubans practice some form of Santería (U.S. Department of State 2011).

Within Santería, Yoruba deities (*orishás*) are paired with the Catholic saints that serve similar purposes. For example, within Catholicism, Saint Lazarus, the patron saint of healing, is similar to *Babalú Aye*, the Yoruba *orishá* of healing (Cuban Traditions 2006–2007). This mixture of European religions with indigenous practices is a prime example of religious syncretism, or the integration of two or more religious traditions into one. In the case of Santería, a more precise description of the religious integration would include a description of the force with which the Spaniards attempted to replace Taíno and Yoruba religions with Catholicism. The inability to erase these religious traditions speaks to their resilience and cultural importance.

Women are considered quite powerful within Santería and Taíno religious traditions. They often oversee religious

ceremonies, distribute holistic medicines, and continue to expand the capacities in which they are culturally permitted to serve. Traditionally, the musical element of Santería was reserved for men, based on the perceived physical demands of high-energy drumming, but women have begun to occupy larger musical roles in *Batá* drumming (Rodríguez 2014). While women are still prohibited from playing music during many ceremonies within Santería, the growing notoriety of all-women groups and female musical artists on the island has signaled a constantly evolving acceptance of changing gender roles. It is important to note that the Yoruba tribe in West Africa, from which many of the syncretic practices of Santería originate, is also a matrilineal society, contributing to women’s centrality. It is believed that there is so much power within the female form that women are prohibited from participating in certain ceremonies while they are menstruating.

Even though Cubans enjoy a rich and prevalent religious syncretism, many practitioners have often been forced to hide their religious convictions. One fundamental tenet of socialism, as outlined by the German philosopher and economist Karl Marx (often considered one of the most prominent socialist thinkers of the 19th century), was that organized religion prevented the proletariat (working poor) from acknowledging their exploitation by the bourgeoisie (wealthy business owners). In line with this, one of the central goals of the socialist government was to limit the power of organized religion over Cuban citizens. Although the 1976 constitution claimed to respect religious freedom, the state itself actively encouraged atheism until 1992 and often enacted localized discriminatory policies that limited the ability of religious orders to survive (U.S. Department of State 2011). This move radically set Cuba apart from other former Spanish colonies, where practicing Catholicism was the norm even though it was often strongly forced upon indigenous and enslaved populations. More recently, many who identify as Catholic do so in name only, meaning that they identify as Catholic but do not attend mass or confession regularly.

Issues

There are several issues affecting women in Cuba, and many can be traced to specific catalytic historical events. Prior to the revolution in 1959, Cuba was quite similar to other Spanish colonies in the Caribbean. Women were encouraged to occupy traditional European colonial gender roles of homemaker and mother, and they were limited

in their rights and privileges. With the unprecedented influx of enslaved Africans, racism became deeply rooted in Cuban society (Minority Rights Group International 2005). Enslaved women were routinely victims of sexual abuse, and even after the abolition of slavery, Afro-Cuban women did not experience an automatic escape from sexual violence and exploitation. Despite the efforts of the revolution to promote gender and racial equity, Afro-Cuban women continue to face disproportionate obstacles relative to their mestizo or white counterparts.

During the *período especial*, many women shouldered a disproportionate burden, as the push toward gender equality often resulted in women being left as the heads of their household. Cuba also experienced numerous waves of expatriation that were motivated by a variety of reasons, including financial hardship on the island, a desire to reunite with already expatriated family or friends, or discrimination or persecution by the Castro regime. The latter two scenarios were common in the decades following the revolution for intellectuals, political dissidents, and LGBTQ+ individuals. There continues to be active dissent in reaction to the Cuban government and police force, and activists face documented censorship and routine police violence (Sánchez 2011, 28–29).

LGBTQ Rights and Community

Lesbian, gay, bisexual, transgender, queer, and other non-heterosexual (LGBTQ+) individuals do not have universally equal rights under the current administration, but progress has been made in recent years. Before the revolution, Cubans whose sexual orientation fell outside of the norm were castigated, forced to hide, or became victims of police brutality, and they faced disproportionate discrimination during the first three decades of the Castro regime. It was not until the 1990s that a cultural push for visibility and acceptance catalyzed a shift in government policy. A popular film, *Fresa y Chocolate* (*Strawberry and Chocolate*, Gutierrez 1991) is credited with bringing more visibility to the plight of gay Cubans and for its critique of their mistreatment at the hands of the government.

Within indigenous communities on the island, as well as numerous indigenous communities all over the world, European colonization drastically changed the state of affairs for nonheterosexual or gender nonconforming individuals and their place in society. The umbrella term that these individuals have adopted in recent years, Two-Spirit, is meant to describe the embodiment of both male

and female spirits within one person. Prior to colonization, Two-Spirit individuals were held in high esteem for their ability to see multiple perspectives, and they often served as marriage counselors, undertakers, and other positions where these perspectives were useful. Taíno creation myths also prominently feature Two-Spirit deities.

When the Spanish colonizers arrived, they forced conversion and gender conformity on Two-Spirit individuals, often in combination with acts of sexual, emotional, and physical abuse (Miranda 2013). To survive, these individuals often had to separate their sexuality or gender from their social roles, meaning that some were forced to hide their sexuality to serve as an undertaker for their communities, a job which became increasingly more important as the Spanish began the genocide of native communities. Presently, there is a resurgence of Two-Spirit communities and a push for the acknowledgment of their importance to their tribes and the larger community.

Prostitution and Sex Work

Because of the depressed Cuban economy, more women have had to find unregulated sources of income than men, whose unemployment rate is lower than that of women (World Bank 2013). While some are able to make money through more culturally acceptable entrepreneurial methods, prostitution is widespread on the island. Women who work in tourist areas often earn their money in foreign currency (CUCs), which equates to far more than what those who work with Cuban citizens and Cuban pesos earn (Fernandez 1999, 89). Although there are no exact statistics showing the magnitude of the prostitution industry, many firsthand accounts of travel to the island mention it to some degree. Despite varying statistics, it is clear that sexual relationships in which money is exchanged are more often characterized as sex work when the sex worker—usually a woman—is Afro-Cuban (Fernandez 1999, 85). This racialized view of prostitution contributes to the oversexualization of Afro-Cuban women's bodies.

Sex workers face higher-than-average risks of sexually transmitted infections, unplanned pregnancy, and sexual and physical violence. The Cuban medical system is designed to provide contraceptive and abortion services to all citizens, making sex work slightly less risky than in other Caribbean and Latin American countries (Pope 2005, 110). However, cultural views of prostitution often lead to discrimination and limited access to necessary health care and educational resources.

Limited Travel and Emigration

After the revolution, the Soviet Union supported the Cuban economy and subsidized the importation of crude oil and foodstuffs. When the USSR collapsed in 1991, Cuba was left without its main source of sustenance, and it entered into the Special Period. Many Cuban citizens who could not afford the legal pathway to expatriation have continuously attempted to cross the 90 miles of water that separate Cuba from the United States to arrive in Florida. The U.S. government, in attempts to encourage dissent and defection from Cuban socialism, created the Cuban Adjustment Act in 1966, also known as the “wet foot, dry foot” law, where Cubans who make it to U.S. soil are allowed to stay and become eligible to apply for permanent residence after one year and those captured at sea are returned to Cuba or elsewhere (U.S. Citizenship and Immigration Service 2011; Morley 2007). Since Raúl Castro came into power, the regulation of Cuban emigration has become more lenient. It is easier for Cuban citizens to rent cars, acquire passports, and apply for foreign visas. In 2014, President Barack Obama initiated policy reform with the hope of normalizing Cuban-U.S. relations, and plans were made to establish a U.S. embassy on the island.

Guantánamo

In the early 1900s, and in exchange for military assistance from the United States, Cuba agreed to lease a portion of land surrounding the Guantánamo Bay to the United States for naval operations. As was the case with several military bases abroad, U.S. soldiers often sought out local women for prostitution. The U.S. government continued to lease the land despite deteriorating foreign relations and the Cold War, which was marked by rising tensions between the United States and the Soviet Union. This prison, which houses no female inmates but employs female U.S. military guards, has been consistently criticized for the physical, mental, and sexual abuse of prisoners; violations of prisoner rights, specifically to a fair and speedy trial (many inmates from around the world have been detained in the war on terrorism for years without being charged with specific crimes or facing trial); and torture. Although soldiers from the United States are technically not permitted to leave the facility—a consequence of the trade embargo—it is not uncommon for Cuban women to frequent the area as sex workers catering to the soldiers.

Expatriated Relatives

Prior to the 1959 revolution, various foreign corporations, including the Hershey Chocolate Company and Hilton Hotels, had made investments on the island (Baklanoff 2008). When the Castro government took power, nearly all of these businesses were forced to leave, and a wave of upper-class Cubans followed, knowing that they would lose most of their capital and property as a result of the massive redistribution of wealth that was promised. Thousands of Cubans settled in Miami, Florida, and have since contributed to a flourishing Latino community. This exodus separated thousands of families, and their ability to reunite has been further stifled by the 1960 U.S. trade embargo. Residual racial inequality from the previous centuries of slavery and colonialism left many Afro-Cubans without the resources to leave the island and escape the revolution. Like other economically motivated migrations, many Cuban men left the island, and women remained, exacerbating expectations that women remain in the home. The revolution's push for women to enter the workforce came under the banner of gender equality, but it arose out of the necessity to jump-start the newly restructured economy.

Deteriorating Infrastructure

Following the revolution, larger properties that had previously belonged to wealthy Cubans or foreign investors were divided into various apartments in an attempt to redistribute wealth. Due to limited resources, these apartments were often not adequately sized for the number of people designated to live in them, nor were they always equipped with the amenities that might be expected for a single-family living space. As a result of the decaying infrastructure on the island, it is not uncommon for multiple generations to live under one roof.

The U.S. trade embargo of 1961 and Cuba's limited resources meant that very few new amenities reached the island or were produced domestically. This is most visible in the iconic vehicles from the 1950s that have been kept in working order by innovative Cuban mechanics, but it is also a sign of the larger problem of Cuba's crumbling infrastructure. Roads, buildings, electricity, and plumbing are all significantly deteriorating, and Cubans are well-known for their ability to make ends meet even without these basic services. Cubans with physical disabilities face additional obstacles due to the lack of amenities, and women who head households or work the “double shift” often go

without recognition for their immense efforts to keep their households in working order.

After the end of Raúl Castro's government, the future of the Cuban Republic and the state of affairs for its women will be vulnerable to change. The resiliency and perseverance of Cuban citizens will continue to be tested, and the influence of foreign governments has yet to be seen. Many hope that the country will again open its borders, both physical and metaphorical, and allow for a much-needed influx of resources. A push toward repairing relations with the United States has already begun (Sánchez 2011, 108–109).

Cuba remains an inimitable artifact of the intersections of European colonialism, indigenous Caribbean peoples, enslaved Africans, North American and Soviet imperialism, and its own unique manifestation of socialism. Women have played a central, although not always appreciated, role in the survival of the republic, and despite numerous challenges and limitations, Cuban women continue to persevere.

D

Dominican Republic

Overview of Country

The Dominican Republic is located on the island of Hispaniola and occupies the eastern two-thirds of the island it shares with Haiti. Hispaniola is second-largest island of the West Indies and is part of the Greater Antilles Archipelago in the Caribbean Sea, spanning an area of 29,418 square miles (76,192 sq. km). Its greatest length is nearly 400 miles (650 km), and its width is 150 miles (241 km).

The island was colonized by the Spanish in the late 1400s; Christopher Columbus conquered and claimed it for Spain in 1492. Hispaniola's conquest became a catalyst for the Spanish conquests of the Caribbean and the "American" mainland. In 1697, Spain recognized French control of the western third of the island. The remaining eastern portion of the island by then was known as Santo Domingo. Although Dominicans pushed to gain independence, the country was occupied by Haiti in 1821 for 22 years. In 1844, the Dominican Republic finally gained independence from Haiti; however, the nation returned to Spanish rule. After a 2-year war, independence was restored in 1865 (CIA 2014). Soon after, the United States responded by enforcing two military occupations, one from 1916 to 1924 and another from 1965 to 1966 (CIA 2014; One World Nations Online 2014).

The island is currently inhabited by approximately 10 million individuals, consisting of mixed European, African, and indigenous origins (an ethnic mix of 11% black, 73% mixed, and 16% white) (The Editors of Encyclopædia Britannica 2013; BBC 2012). The official language of the Dominican Republic is Spanish, and 95 percent of the population is Roman Catholic (CIA 2014).

Current population statistics do not account for Haitian immigrants and their descendants who reside in the country because of policies aimed at removing or prohibiting their Dominican citizenship. An estimated 500,000–1 million Haitians and Dominicans of Haitian descent live in the Dominican Republic. While some maintain a circular migration, returning to Haiti after seasonal work is completed, many have resided in the Dominican Republic since the early 1900s and have had children and grandchildren there (Bartlett 2011). People born on Dominican land have been granted citizenship for generations. However, people of Haitian descent often experienced biased practices when receiving official documents, and in recent decades, civil registry officials often excluded the children of Haitian migrants whose documents were in question by considering their parents "in transit." (Archibold 2013).

The current government functions as a representative democracy with national powers divided among independent legislative, executive, and judicial branches (CIA 2014). Past governments can be characterized as

authoritarian and brutal with nonrepresentative rule (Background Note 2007; CIA 2014; On War 2000). The president appoints the cabinet, executes laws passed by the legislative branch, and is commander in chief of the armed forces (CIA 2014). The Dominican Republic has had over 38 constitutions and disseminates it whenever an amendment is ratified (CIA 2014).

The per capita gross domestic product (GDP) was estimated at USD\$15,900 in 2016 (CIA 2017). In fact, 40.9 percent live below the national poverty line, not including unaccounted and undocumented persons (World Bank 2014).

The wealthiest 10 percent of the population are predominantly white descendants of Spanish settlers who own most of the land and benefit from approximately 40 percent of the national income. The unemployment rate is 29.4 percent. The poorest of the population are predominantly of African descent, including an estimated 1 million with Haitian immigrant or migrant origin (Sagás 1993). The United States is the Dominican Republic's largest trading partner and home to a large diaspora whose remittances account for up to 10 percent of national income (BBC 2012).

Average life expectancy is 73.3 years with an infant mortality rate of 19.63 deaths per 1,000 live births and a maternal mortality rate of 150 deaths per 100,000 live births (2010) (CIA 2014). The Dominican Republic's government fails to take into consideration human rights violations for women and children and those who have been denied citizenship or who are working in the informal sector. These numbers reflect the lower quality of life for Dominican women and children as well as Dominicans, Haitians, and Haitians of Dominican descent.

Historical Background of the Dominican Republic and Haiti

Before Columbus arrived in 1492, the Taínos, an Arawak-speaking people, inhabited the island. When Columbus landed, he claimed the island for Spain and named it "Las Isla Espanola" (Nations Online 2014). Spanish colonization, Haitian, Spanish, and U.S. occupations, and the struggle for power between the Dominican Republic and Haiti have shaped the country in numerous ways (Sagás 1993). While the two nations share common ancestral African and indigenous heritage, the histories of both portended contemporary issues surrounding Dominicans

and Haitians in the Dominican Republic (Embassy of the Dominican Republic in the United States 2014).

With the Haitian revolution in 1804, Haiti became the first free black republic in the world, which "represented a terrifying notion for white nations: the massacre of most whites, the destruction of European civilization, and their replacement by a black republic led by ex-slaves themselves" (Sagás 1993). Spanish colonial elites feared being conquered by Haiti, resulting in reified notions of nationalism among Spanish inhabitants of Hispaniola. As the first free black republic, Haiti gained outsider status, sparking much of the internal hostility between the two nations. Most notably, this resulted in Haiti's political isolation and fear within the Spanish territory of being conquered by blacks. Subsequently, many Western governments refused to recognize Haiti as a sovereign nation until France did so in 1825. However, it came at the regrettable expense of 150 million francs, as compensation for the property the French slave owners lost after the rebellion (Hallward 2004).

Another key event was Haiti's takeover of the island's eastern Spanish colonial territory in 1822, which was then followed by an overthrow of Haitian occupation in 1844 that created the modern Dominican state and Dominican Independence Day. Ironically, Dominican Independence Day came after the break between Haiti and not from Spanish colonizers (Martinez 1999). Such events created a path of conflict that defined Haiti as "the other": "From its inception, then, the Dominican nation (particularly as constructed by its elites) has literally been based on the rejection of Haiti" (Paulino 2006, 269). Despite this, Haitians were invited into the eastern portion of the island; their presence helped abolish the institution of slavery, thereby eliminating Spanish rule. Subsequent events due to the Haitian revolution and occupation brought freedom from slavery for generations of Dominicans (Turtis 2003). Despite this aid, Dominican elites perpetuated their fears of Haitian occupation and anti-Haitian ideology.

Anti-Haitian ideology was employed as a tool for national cohesion and domination and was perpetuated by and throughout the Dominican Republic—even the United States promoted anti-Haitian ideology. Being Dominican became identified with being anti-Haitian (Torres-Saillant 2003). "Although Afro-Dominicans make up the majority racial group in the Dominican Republic, and black cultural practices such as Dominican Vodou, are important components of national culture, these practices

are not recognized within official versions of Dominican uniqueness that affirm the notion of nationalism where the Dominican culture is exclusively white, Spanish, and Catholic” (Adams 2006). In their development of a Dominican national identity, “elites combined race, nation, and religion to serve as a marker of difference between Haitians and Dominicans that would pass from generation to generation” (Tavernier 2008, 3).

Overview of Women’s Lives

The legacy of colonization has influenced much of the tension between the Dominican Republic and Haiti, affecting the lives of women and children of Dominican, Haitian, and Dominicans of Haitian descent residing in the country. Globalization, racialization, feminization of the workforce, and migration have shaped women’s and children’s experiences, with women working more than 12 hours a day and still experiencing poverty and some being prohibited from working due to legal status (JICA 2011). Such challenges contribute to the country’s Gender Inequality Index (GII), which, in 2013, ranked it 105th out of 187 nations (UNDP 2014).

Girls and Teens

Teen Pregnancy

According to the UN Population Fund, 105 out of every 1,000 Dominican teenagers become pregnant, surpassing the world average of 49. Additionally, 22.1 percent of Dominican teenagers have been or are pregnant, and over 50 percent of those, whether married or cohabiting, are not using family planning methods (Dominican Today 2014). Certain provinces experience higher rates, such as Azua (37%), Bahoruco (35%), and Santiago (29%). Independencia, San Cristóbal, La Romana, Montecristi, Dajabón, Puerto Plata, and Santo Domingo also have higher teen pregnancy rates. In big cities, rates for teens that have been pregnant at some time are approximately 18.9 percent, while in rural areas it is 24.2 percent. Areas located in the impoverished Enriquillo Region have teen pregnancy rates of 33 percent, triple that of the higher resourced area of the Cibao-Northwest Region at 11.4 percent (Dominican Today 2014).

Education

Education is important for the development of any country. Although the Dominican Republic spends approximately

2.2 percent of its GDP on education, the General Law of Education indicates that public spending should be 4 percent of GDP (CIA 2014). Formal education consists of primary, secondary, and higher education. Education is free and compulsory for ages 5–14; however, it is rarely enforced, specifically in rural areas. Uniforms are required to attend school, but neither the government nor the schools provide them. Thus, if families do not have funds to purchase uniforms, they do not send their children to school. Similarly, school supplies are not provided and can affect whether children can attend school. Nonprofits have stepped in to remedy this resulting in increased attendance (UNESCO 2016).

Many students from low-income families do not complete the final four years of compulsory education at secondary schools. The education system is intended to encourage upper- and middle-class youth to reach higher levels of education by graduating from high school and receiving a diploma, a *bachillerato* degree (Classbase 2012). According to Save the Children, fewer than 10 percent of the Dominican Republic’s 3.7 million children will graduate from high school (Ingram 2011).

Although the Dominican Republic is committed to providing equal access to education, children who are born in the country to Haitian parents are denied birth certificates and identity documents required to enroll in school. Negative bias toward Haitians, anti-Haitianism, causes many Haitian and Dominican children of Haitian descent to suffer unequal access to education (Kim 2013; Ingram 2011).

While 75 out of 100 Dominican children entering formal education complete the fourth grade, only 63 complete the sixth grade, and approximately 52 complete the eighth grade. Rural areas experience even worse completion rates, where just 12 percent of low-income students who start high school complete their studies, compared to 62 percent of those from higher income groups (Dream Project 2014).

The literacy rate has increased from 89 percent in 2004 to 91.2 percent in 2009; illiteracy is still concentrated in rural areas. The Dominican government has targeted illiteracy with campaigns centered on teaching in rural areas, and in 2009, the Ministry of Education launched the Patria Letrada program with the goal of teaching reading and writing to approximately 700,000 Dominicans within four years. As of 2015, the overall literacy rate is 91 percent. Men, at 91 percent, lag slightly behind women at 92 percent (CIA 2017). Currently, the educational system presents parity in enrollment for both boys and girls at the different levels, primary and secondary, though indicators

such as dropout and grade repetition are higher for boys (CIA 2014).

Despite advancements, gaps between women and men exist. Women account for 64 percent of the university population between 2006 and 2009, and they are the majority among graduated students (Clark 2013). However, women are concentrated in low-end jobs and receive less pay than their male counterparts for equal work. Without the government spending more on education to equalize access to education and improve lives, breaking the cycle of poverty remains difficult.

Health

Access to Health Care

The health system is composed of a public sector and a private sector. Through the social security system, reforms have been implemented in the framework of social protection to improve access to health services and pensions for 40 percent of the population. According to the National Statistics Office, the country's 2010 population was estimated at 9,884,371 inhabitants, with an annual growth of 1.36 percent (CIA 2014). A drop in birth and fertility rates in recent years has lowered the dependency ratio (the number of people relying on social services compared to employed persons) from 65.5 in 2000, to 62.8 in 2005, and 59.3 in 2010. Life expectancy at birth rose from 65.3 years in 1990 to 71.5 years in 2005, and it was estimated at 72.8 years in 2010 (70.1 for males and 75.8 for females). With a mean age of 25 years, the population is predominantly young, but with a trend toward aging. A process of rapid urbanization has also been underway (PAHO 2012).

Maternal Health and Reproduction

The Dominican Republic has received considerable assistance from the United States to address sexual and reproductive health issues. Because of the country's relatively high contraceptive prevalence rate, the country graduated from U.S. funding for family planning programs in 2008. It has great examples of comprehensive approaches to sexual and reproductive health and rights for women. For example, PROFAMILIA and Colectiva Mujer y Salud provide high-quality care for a variety of services to address the needs of women and youth, including those who are HIV-positive. Yet, assistance from the United States for family planning and reproductive health has recently ended, leaving PROFAMILIA to count on the Dominican

government and user fees to be sustainable. Government funding is difficult, as it is strongly influenced by the Roman Catholic Church. Given the church's extensive reach across the population (political leaders in the country) and depending on the church's influence in state affairs, doctrine and canon law can play into national legislation (Htun 2003).

PROFAMILIA, a nongovernmental organization (NGO) and International Planned Parenthood Federation (IPPF) member, is one of the country's leaders in women's rights and sexual and reproductive health care providers. They provide a full range of reproductive health care, such as family planning, HIV/AIDS and other STI services, and maternal health, through 1 hospital, 7 stationary clinics, 1 mobile clinic, and 26 community distribution outlets.

PROFAMILIA's model maternity hospital in Santiago is open 24 hours a day and serves approximately 1,000 birthing women every year. To reduce the stigma associated with HIV-positive clients, the clinics use an inclusive approach where HIV clinics are not separated from other sexual and reproductive health services. All users and clients enter through the same entrance and use the same lobby and lab services, regardless of reasons for seeking care. However, an inclusive approach may not work in all organizations and facilities. In addition to health-related services, PROFAMILIA also focuses on gender-based violence in all levels of service, with professional counseling on gender-based violence from a rights-based approach (IPPF 2012).

Comparing the quality and range of care provided by these two organizations with the Dominican health care system is alarming. Public health outlets only contraception offerings are birth control pills, IUDs, condoms (for men), Depo Provera, and sterilization. Furthermore, there is a lack of integration between services in the public sector. Regarding family planning in services offered to postpartum women, 97 percent of women entering the hospital for labor had stated interest in using family planning postpartum; yet, only 12 percent received a method before leaving the hospital. The situation was worse for postabortion care clients, with only 12 percent having received counseling on family planning and only 9 percent received a method prior to leaving (Ingram 2011).

Diseases and Disorders

Dengue fever is endemic in the Dominican Republic and usually occurs during the rainy season (June–October).

All serotypes from the dengue virus have been isolated. In 2007, there were 9,650 cases reported, of which 227 were serious. There were 43 deaths and a case-fatality rate of 18.9 percent (PAHO 2012).

HIV/AIDS

The HIV epidemic has remained stable. In 2010, the prevalence of HIV in those 15–49 years old was estimated at 0.85 percent. That is, there were 48,550 people living with HIV/AIDS, of whom 62 percent were women. In 2006, the prevalence was 0.86 percent. In 2009, 12,912 people received antiretroviral therapy (ART). An estimated 442 children were infected with HIV in 2009. Since ART started in 2004, mortality in those aged 15–49 fell from 3.22 per 100,000 in 2005 to 2.13 per 100,000 in 2009. The current annual incidence rate is estimated at 0.06 cases per 100,000, representing 3,580 new cases in 2010 (PAHO 2012). The prevalence in pregnant women is over 1 percent. In 2010, pregnant women received an estimated 1,980 preventive antiretroviral treatments. Although the percentage of HIV-positive pregnant women who received ART increased from 37.2 percent in 2006 to 47.0 percent in 2009, more than half still did not receive treatment (PAHO 2012).

Employment

The Dominican Republic has long depended on sugar for employment, though since the 1970s and 1980s, it has expanded its economy to include the service sector, which surpassed agriculture as the economy's largest employer due to growth in telecommunications, tourism, and free-trade zones (FTZ). The United States is the destination for over 50 percent of Dominican exports; the economy heavily depends on that relationship.

Recent decades have seen strong economic growth, and the labor market has experienced higher female participation. From 1991 to 2010, employment increased from approximately 2.2 million to 3.8 million, growing at a moderately higher pace than the total working-age population. Within this time period, the employment-to-population ratio increased from 51.6 percent to 55.5 percent (ILO 2013). This was the result of greater female participation, while the male ratio declined slightly from 73.5 percent to 72.6 percent. Women took the greatest advantage from the expansion of the demand for work—first in manufacturing in the “Zonas Francas,” special industrial

zones, in booming tourism, and then in personal services (Guzmán 2010; Marquez 2011; IMF 2012). In rural areas, from 2000 to 2007, women's participation rates increased from 29.5 percent to 38.4 percent (UNDP 2010).

Women's labor activity rates have grown closer to those of more advanced economies, a trend witnessed in other Latin American countries. Despite this growth, male and female employment rates overall are lower than regional averages, implying areas of inactivity and discouragement, specifically among women (ILO 2013). Moreover, the country suffers from marked income inequality in which the poorest half receives less than one-fifth of the GDP, while the wealthiest 10 percent enjoys almost 40 percent of the GDP (CIA 2014).

The overall unemployment rate is 24.9 percent; for women, it is 25 percent, and it is 14.7 percent for men (JICA 2011). For Haitians and Dominicans of Haitian descent, the rate is worse due to their lack of documentation of statehood or residency. They work in low-wage industries such as agriculture and construction or as domestic workers. In 2012, the U.S. State Department reported severe human rights problems, citing discrimination against Haitian migrants as among the most serious (Solidarity Center 2013). Ninety percent of the nation's 300,000 domestic workers are women, and female immigrants, primarily from Haiti, make up 10–33 percent of domestic workers (Solidarity Center 2013). Their immigration or migration status prevents them from seeking more favorable and just working conditions or other employers, leaving them vulnerable to abuse and exploitation (Solidarity Center 2013).

Pay

The increase in free-trade zones (FTZ) took advantage of a labor force consisting primarily of Dominican and Haitian women, young and old, working for very low wages. FTZs, typically near major ports and national borders, are contracted from companies throughout the world, and they allow business owners to enjoy limited regulations, restrictions, and taxations. Moreover, FTZs permit certain types of operations that may not otherwise be allowed or may require specific licensing inside the country (JICA 2011; Council 2014).

Despite wage variations, women earn less overall than men for equal work, and women's per capita income is one-third of their male counterparts. The minimum wage, the lowest amount a worker can be legally paid for their work, is 4,900 Dominican pesos (approximately \$103USD)

a month in the FTZs and between 4,485 and 7,360 pesos outside the FTZs, depending on company size. In the public sector, it is 2,600 pesos per month. Based on a 10-hour workday, farm workers earn 150 pesos a day, and sugarcane workers earn 95 pesos per day. The country's wage gap is 79 percent, meaning women receive 79 pesos for every 100 paid to men (JICA 2011).

Working Conditions

Many Dominicans experience difficult working conditions. Agricultural laborers and farmers endure unsafe working conditions, much of which is done by Haitian sugarcane cutters, work that many Dominicans are unwilling to do. In addition, Haitian migrant workers provide cheap labor in construction and domestic work sectors of the informal economy. Given the uncertainty of employment duration and a fear of deportation, Dominican workers of Haitian descent are more vulnerable to rights abuses and are at a greater risk of human trafficking (Solidarity Center 2014; UHY 2012). Undocumented Haitian migrants have no employment rights and frequently experience exploitation and abuse (UHY 2012).

Working conditions vary by industry, but many workers are exposed to unsafe and unsanitary environments in return for low wages. Approximately, 8 percent of the country's workforce is employed in the FTZ (JICA 2011). The industrial free zones are known to be hostile to union activity, even though they are legal and entitled to operate. However, many employers feel threatened and often fire union activists. Proponents of free-trade zones claim that they bring employment to places with few opportunities and that women benefit the most from this work. It is estimated that women make up about one-third of the formal workforce, but many are employed informally in private homes or in either large- or small-scale sweatshops. Similarly, hundreds of thousands of children are employed in these sectors and experience inequities (JICA 2011).

Domestic Workers

Domestic workers tend to work 14–18 hours a day, cooking, cleaning, or caring for someone else's children, and are usually underpaid or sometimes only paid room and board. Many live in the homes of their employers and are subject to physical, emotional, and sexual abuse (JICA 2011).

Additionally, Dominican women are often employed as prostitutes to work in the tourism industry. Although prostitution is outlawed, it is socially acceptable and public.

Very few commercial sex workers complete primary education, and many are illiterate (Solidarity Center 2013).

Family Life

Maternity and Paternity Leave

Female workers are entitled to maternity leave of 12 weeks, with 6 weeks to be taken before childbirth and 6 weeks after childbirth. When the female worker has not used all her leave prior to giving birth, the remaining unused leave will be added onto the time taken after childbirth. However, the total prenatal and postnatal leave cannot add up to less than 12 weeks, and during that time, the woman retains her job with all of its accompanying rights. (Labor Code, Art. 237; USAID 2009). Men, who are registered with a company are granted 2 days of paid leave when their spouse or partner gives birth (Labor Code, Art. 54; USAID 2009).

Gender Roles

The Dominican Republic culture values machismo, very rigid gender roles, and an extreme sense of masculine power. Men's reputation is of controlling women. Performing machismo sexual behaviors gives men a sense of pride; they must prove their manliness by upholding their sexual dominance. Reputation is one of the driving forces behind machismo (USAID 2009; Stanford University 2014). Men flaunt their machismo in a variety of ways, such as very bold comments and gestures, staring, and hissing noises as women pass by. Ignoring them usually stops the behavior; however, if women engage and acknowledge them, the behavior continues (USAID 2009).

Dominican culture values nonaggressive and nonassertive behavior in women. Women tend to be in charge of managing and maintaining the family structure, while men maintain the role of the authority figure of the home (USAID 2009). One foundation of Dominican culture is the sense of family, and women maintain and sustain that pillar.

Extended family also plays a large role in the culture. Everyone knows everyone, and family connections are imperative in both business and politics. Marrying into the right family is a prime concern many parents have for their children (USAID 2009).

Whereas Dominican men are concerned with establishing a macho identity, Dominican women are concerned with their physical appearance. A lot of pressure

is placed on women of all ages to be thin and spend a lot of time on their hair. Aesthetics and norms regarding skin color and hair are rooted in the legacy of colonialism and colorism. Tightly coiled hair of people of African descent is referred to as “bad hair,” or *pelo malo*, and the straight hair of white Europeans is called “good hair.” Darker skin has been associated with a lower standard of beauty; however, this norm has shifted, and brown skin has become aesthetically acceptable. Standards for hair have remained, and straightening one’s hair is the norm (Murray 2010).

Generally, Dominicans perceive and describe themselves as “cinnamon” and use the word *indio* on official documents in place of *black*. Historically, this is due to the atrocities committed by blacks during the Haitian occupation; fear continues to be fueled by horror stories of voodoo practices among immigrants and along the border. Even though Dominicans consider themselves to be racially unprejudiced, North Americans dark enough to be taken for Haitians will bear the onus of anti-Haitianism. Many times, Dominicans do not willingly discuss these topics (Miller and Hines 1985).

Politics

The Dominican Republic enjoys democratic stability, and during the last two electoral periods (2004–2008 and 2008–2012), it has been governed by the Dominican Liberation Party.

Political Participation

Continued democratization is expected to reduce gender gaps in the political realm (Morgan et al. 2008). Dominican women attained significant political advances during the 1990s, and political elites, led by coalitions of female civil leaders and legislators, encouraged women’s rights and access to elected office (Gomez Carrasco 2005).

With strong motivation by the Centro de Investigación para la Acción Femenina, a well-known governmental organization that focuses on women’s issues, political parties included women’s issues to varying degrees for the first time during the 1990 electoral campaign (Cordero 1991). Several women’s groups from political parties, NGOs, and community organizations created an extensive plan to provide women with equal opportunities (Gomez Carrasco, 2005). By the mid-1990s, politicians were utilizing gender-inclusive language in their campaign speeches. Subsequently, important legal and bureaucratic changes

favoring gender equity were also obtained. For example, funding for the Office for the Promotion of Women (Dirección General de la Promoción de la Mujer, or DGPM), established in 1982 within the president’s ministry, increased during the 1990s. In response to a long-standing demand of feminist groups, the DGPM was elevated to the cabinet level, becoming the Ministry of Women (Secretaría de Estado de la Mujer) in 1999 (CEDAW 1998).

In 1997, Congress passed two laws promoting women’s private and public rights. The first law (Ley Contra la Violencia Intrafamiliar) established protection from domestic violence in conjunction with the Inter-American Convention on the Prevention, Punishment and Eradication of Violence against Women, which the Dominican Republic ratified in 1995 (CEDAW 1998). The second law set a quota system requiring women to be 25 percent of the candidates in city council and Chamber of Deputies elections. In 2000, new laws were passed that elevated the quota to 33 percent; established that male and female candidates should alternate in placement on party lists; and required parties to nominate a woman for either mayor or vice mayor (BBC 2012). Due to these reforms, the Dominican Republic now compares favorably to other countries regarding women in local-level offices and the legislature, though not in national executive-level cabinet positions.

In 2000, a symbolic measure of progress was made for women when Milagros Ortiz Bosch was elected the country’s first female vice president. Yet, progress did not continue in a straightforward manner. Discourse among political elites shifted dramatically as the 2004 presidential campaign neared, becoming more confrontational and less positive toward women (Morgan et al. 2008). Prior to 2004, positive cues from elites enhanced support for women in politics among party followers. Overall levels of support for women decreased, and negative cues by party leaders hurt the perceptions of women among male followers. This aligns with other research regarding the importance of contextual cues influencing political behavior and attitudes and suggests that advances in men’s support of gender issues are less stable than those among women (Morgan et al. 2008).

Women’s Rights

Women’s rights have slightly increased over the decades; however, women still experience discrimination that influences equitable advancement. Until the 1998 Land Reform Act, women were not legally entitled to obtain

land inheritance, and men retained ownership of property after a divorce. Less than 7 percent of women report having sole or co-ownership of land. Most women benefiting from this tend to be between the ages of 41 and 60 years, limiting access to land for younger and older women. Surveys conducted by the Secretary of State for Agriculture suggest that, relative to men, women are granted smaller plots of land with low productivity that only provide a minimal level of livelihood. Women also find it more difficult than men to exercise their right to access bank loans. Although the Dominican Agrarian Institute offers specific credit facilities for women, the number of women who benefit from such loans is persistently low (SIGI 2016).

According to the Social Institutions & Gender Index (SIGI), a groundbreaking measure that recognizes and quantifies underlying discriminatory social institutions and legal frameworks (i.e., early marriage, discriminatory inheritance practices, violence against women, son bias, restrictions on access to public space, and restricted access to productive resources), the Dominican Republic is placed in the very low levels of the gender discrimination category (SIGI 2016). Its value of 0.037 ranked it 12th out of 108 countries in the 2014 index, compared to its 2012 ranking of 9th out of 86 and the 2009 ranking of 40th out of 102 (SIGI 2016).

Lesbian Rights

The Dominican Republic does not distinguish between same-sex and heterosexual relationships for adults who are 18 years of age or older; the age of consent is 18 for all (ILGBTIA 2009).

Military Service

Military service is not compulsory, and individuals over the age of 18 can voluntarily enlist. Recruits must have completed primary school and be Dominican citizens. Women may also volunteer (CIA 2014). The Dominican military consists of three branches: army, navy, and the air force (NationMaster 2014).

Religious and Cultural Roles

Approximately 95 percent of the population is Roman Catholic, and women's roles in the Dominican Catholic Church, which varies among parishes, can be minimal. Some suggest that the church's stance on contraception

and women's reproductive health is conservative, patriarchal, and oppressive.

Several Catholic organizations have attacked organizations aimed at improving women's reproductive rights. PROFAMILIA has been under attack since its inception. In 2013, the Catholic Church filed a legal complaint against PROFAMILIA, claiming that their campaign for sexual and reproductive rights violated the Dominican Constitution. The Fifth Civil and Commercial Chamber of the National District issued a ruling that rejected the church's complaint and stated that PROFAMILIA had not violated the constitution. The chamber further stated that censoring the right of a nongovernmental organization (NGO) to carry out a public awareness campaign breaches the right to freedom of expression. Along with strong stances against women's reproductive rights, the church condemns African-related religious rituals, which are also actively suppressed by the police or within the community.

Spirituality

Regardless of their personal beliefs or appearance, Dominicans believe Dominican nationality and identity to be white, Catholic, and Spanish. Overlooking strong African influences and traditional herbal knowledge stemming from Taíno indigenous heritage, many Dominicans consider themselves Catholic regardless of daily practices (Miller and Hines 1985).

Despite the biases against African heritage, the Dominican Republic, being a nation full of African heritage, preserved some African religions and traits and to varying degrees, and Afro-Caribbean religions are integrated into Catholicism. Some religions may only use the images of saints, but they may be completely Africanized in every other aspect. Some religions are fully Christian with little African influence.

Haitian and Cuban immigrants practice voodoo and Santería. The majority of their ceremonies, which incorporate possession, magic, African rhythms, and dance, are hidden from the main population, as many Dominicans believe that these are pagan rituals. Thus, it is difficult to determine the number of practitioners (Miller and Hines 1985).

Santería has historically and culturally honored women and upheld their value in society. Women play many roles, such as cooks, cleaners in the *igbodu* (sacred room), or as seamstresses for garments and altar decorations. While all of these roles are sacred and important, historically,

women were the leaders and lore keepers of Santería. They were *oriatas*, or masters of ceremonies, who officiated initiations, butchered and sacrificed animals, and performed all of the other tasks stereotypically delegated to men. Women were some of the most powerful diviners in using the *diloggun* (complex divination system); yet, this role is now typically assigned to men (Shangó 2012).

Issues

Sexual Harassment

While the Dominican Labor Code addressed sexual harassment in 1992, it is not recorded as such in offices that handle complaints. Because sexual harassment is not registered as a legal precept, the complaints are frequently included with those of sexual violence in neighborhood police reports and the prosecutors' and the attorney general's offices (Inter-American Commission on Human Rights 2014; JICA 2011). Many victims are women who are afraid to report the harassment for fear of losing their jobs or receiving retaliation from the perpetrators (JICA 2011).

Violence

Despite the passing of a law against family violence in 1997, La Ley Contra La Violencia Domestica, and having gained a lot of support by international groups, many domestic violence crimes are unreported. Exemption from punishment of domestic violence crimes is high, based on figures from the Statistics Department of the Public Prosecutor's Office of the National District in Santo Domingo. Their Violence Prevention and Care Unit data from January to September 2008 shows 8,316 reports of gender violence and 17 convictions (Codik 2006).

More recent data show that femicide is a primary cause of death among women of reproductive age; between January and October 2012, 63 women were murdered (Countries and Their Cultures 2014). The National Observatory on Migration and Trafficking of Women and Children places the Dominican Republic among the top four countries in the world with the highest number of female victims trafficked for sexual exploitation purposes. Child sexual abuse and forced sexual relations are also widespread problems, but research is scarce (Codik 2006).

The lack of recent studies analyzing the widespread discrimination and violence against women has hampered political advocacy. Some investigations on violence against migrant women have detected cases of sexual harassment

and fraud at official border crossings, rape and murder off roads and in fields, abuse in the border market region and in family homes where Haitian women work, and forced sexual labor and trafficking of women and girls (BBC 2012). Despite the dearth of research and analysis into women's rights, two organizations, Centro de Investigación para la Acción Femenina (CIPAF) and Colectiva Mujer y Salud, work at the grassroots level to try to change the current situation and campaign for the protection of women's basic rights. CIPAF, along with other NGOs, works to include femicide as a distinct crime represented in the Criminal Code and not classified as homicide or murder (Codik 2006).

E

Ecuador

Overview of Country

The Republic of Ecuador is a South American country bordered by Colombia in the northeast and Peru on the southeast and east. In the west, it has 1,452 square miles of coastline on the Pacific Ocean. The country has four regions comprising a total area of 109,483 square miles (283,560 sq. km): the Andean highlands, the coastal areas, the Amazon, and the Galápagos Islands, which are located 620 miles (1,000 km) off the west coast in the Pacific Ocean. The four regions are divided into 24 provinces.

According to the National Institute of Statistics and Census (INEC), Ecuador has 16 million habitants, of which 50.44 percent are women and 49.56 percent men. The 2010 census asked people about their ethnic identity, resulting in 71.9 percent of the population identifying themselves as mestizo, 7 percent indigenous, 6.1 percent white, 7.2 percent Afro-Ecuadorian, 7.4 percent “montubia” (person from the countryside near the coast), and 0.4 percent other (INEC 2014). Most Ecuadorians speak Spanish (93%), followed by Quechua (4.1%), and other indigenous languages (0.7%) (CIA 2016). Most of the population (91.95%) claims a religious affiliation. Approximately 80.4 percent identify themselves as Catholic, 11.3 percent as Evangelical, 1.29 percent as Jehovah’s Witness, and 6.96 percent as other (INEC 2012a).

Economically, Ecuador is a producer and exporter of raw materials. In the 19th century, cocoa was the main export product, and since then, the main export commodities have become petroleum and its derivatives, bananas, flowers, and tuna and shrimp. Commodities are mostly sold to the United States, China, Russia, Chile, Peru, and Venezuela.

Since its independence in 1830, Ecuador has struggled to attain political stability. Ecuador’s establishment as a republic was a product of a political crisis that ended with the dissolution of the former country of Gran Colombia. From 1819 to 1831, the territory of Gran Colombia included the present-day countries of Colombia, Venezuela, Ecuador, and Panama and the north of Peru and some parts of Guyana and Brazil. Leading to the present, the Ecuadorian state has undergone a period of conservatism, followed by a liberal era, a war over a territorial dispute with Peru, dictatorships, military governments, and many popular uprising and coups in between. The last period of serious institutional instability occurred from 1980 to the first years of the 21st century. This era included 13 presidents, 8 from 1996 to 2007, with some of them lasting just a few days. This concentrated political instability was triggered by popular indignation directed toward the deep economic crisis afflicting the country and spurred by the many public cases of corruption involving high state officials (Conaghan 2011).

The previous president, Rafael Correa (1963–), was in office from 2007 to 2017. In contrast to earlier years, his

term was characterized by relative political stability and a general improvement of the economy marked by high international oil prices, especially between 2008 and 2014. Some of Correa's social policies and increased investment in education and health have gained him popularity among many Ecuadorians, especially those in the middle and lower social strata. Nevertheless, there are social organizations that do not agree with the government's approach to such issues as mining and oil extraction. Many stand against the government, which condones the exploitation of biodiverse environmentally protected areas; officially supports such regimes as North Korea and Byelorussia; approves of recent legislation for the indefinite reelection of public authorities, such as the president and mayors; and criminalizes social protest (Billo and Zukowski 2015; Ortiz Lemos 2013). Since 2015, with the economic crisis related to the drop in oil prices as well as to the economic measures taken by the government, Correa's popularity has significantly dropped (ACOP 2016).

Overview of Women's Lives

The Constitution of Ecuador was approved in 2008 in a referendum won by a majority of almost 65 percent, and the results marked the beginning of the current government. It represents one of the most advanced constitutions in terms of race, ethnicity, gender, and sexual diversity rights. However, some of the policies and state discourses, especially in regard to sexual and reproductive rights, gender roles, homosexuality, and even feminist theory and gender studies, are very unpopular among women's movements in Ecuador.

The heterosexual nuclear family is still the principal subject of the policies and government discourses related to women's issues. As a result, women are mostly conceived of as mothers and housewives, and their issues are understood solely in terms of traditional gender roles. Women who live outside of these traditional roles are considered a minority and are often ignored by the government.

Over the last decade, Ecuadorian women have seen significant improvements regarding access to education, employment, and health services. However, sexual diversity and abortion (illegal in most cases), just like sexual education, are still treated as moral issues and not as problems for health, education, and public policies. Ecuador's Gender Inequality Index (GII), which creates a composite ranking of women's reproductive health, empowerment, and economic status, is 83rd (0.407) out of 155 countries.

Reflecting both the country's progress and continued challenges, this ranking places the country in the high human development category (UNDP 2015).

Girls and Teens

The increasing teenage pregnancy rate concerns the Ecuadorian government and women's organizations in the region, even as maternity rates are decreasing in all other age groups. Teenage motherhood is an underlying problem. Childbirth and its complications are the first causes of hospitalization for girls 10–17 years, affecting 74,000 girls a year. The second cause is abortion, with 8,705 cases recorded in 2014 (*El Comercio* 2015c). Countries with different levels of economic development, educational level, and incidence of poverty are experiencing similar increases in teenage pregnancy rates. That teen pregnancy rates have been increasing regardless of various country factors shows it is a complex phenomenon, which some link to the need for cultural change and gender roles (CEPAL 2011, 18). As a response to teen pregnancy and motherhood, the Ecuadorian government created a political strategy aimed at transforming the cultural conceptions about gender through sexual education.

The subject of sexual education is controversial for Ecuador's current administration. The Intersectorial National Strategy for Family Planning and Teen Pregnancy Prevention (ENIPLA) was the main sexual education policy implemented by the government from 2011 to 2015. The main objective of this strategy was to break traditional stereotypes about sexuality through open dialogue between teenagers, their family, civil society, and the state to naturalize discussions about sexuality as an effective way to promote and guarantee rights to information, sexual health, and reproductive health. This approach included the normalization of sexual diversity and the overcoming of heteronormativity as well as that of considering sexual pleasure as a right.

These views did not agree with the most conservative part of the government, including the president, who thought this strategy was based "on the purest and emptiest hedonism: pleasure for pleasure." President Rafael Correa also stated, "From now on the strategy will be based on values." Since 2015, the sexual education policy is called the Family Plan, and its main goal is "to rescue the role of the family as the bedrock of society" (Correa 2015) and "to achieve a meaningful turn on the behavior pattern of teenagers and young people regarding the experience of

Women's Voices

Gloria Ushigua

Gloria Ushigua lives under threat for her work as a human rights defender on behalf of the Sápara people of the province in Pastaza in Ecuador. She is coordinator of Ashiñwaka—a Sápara women's organization that defends the people's ancestral land. Currently, she is engaged in active resistance against oil drilling on her people's land in the Amazon. "We ask for our right to our territory, and respect for human rights without discrimination" (Ushigua 2016). In 2015, she testified about environmental issues and ongoing threats before the Inter-American Commission for Human Rights, along with other human rights defenders.

Early in 2016, the Sápara Women's Association issued a statement demanding the following:

1. Respect for our rights as an Indigenous Nation;
2. Conservation of our territory, our forests and the Ecuadorian Amazon;
3. Respect and conservation of all protected areas and the Yasuní National Park;
4. The nullification of the contract with Andes Petroleum Ecuador;
5. The immediate end of exploration in Blocks 74, 79 and 83;
6. And that the oil deposits in Block 74, 79 and 83 be left in the ground. (Sápara Women's Association 2016)

Shortly thereafter, the levels of threat and harassment of Ushigua increased, including a night in May when five men sat outside her home in an attempt to intimidate her. Her family members have also been targeted, including the killing of her sister-in-law.

affectivity and sexuality" (Presidencia de la República del Ecuador 2015, 4).

Education

Education and health services have been the focus of the current government's social investment. Education has been recognized as having a central role in the promotion of equality and social justice for all groups of people who have been marginalized due to gender, class, race, ethnicity, and physical disabilities. The government has taken several measures to promote universal access and equal opportunities to education. The main emphasis has been a new legal framework with an intercultural approach in line with international human rights standards. Also, there has been a significant investment in the improvement of school infrastructure and the quality of teaching (United Nations 2013, 10–14).

Currently, gender is not the main reason for discrimination in access to education. The literacy rate among women and men 15–24 years old is 98.8 percent for both groups (CEPAL 2015). In fact, women have access to basic, secondary, and college education at a rate that is the same as or higher than for men. The rate of basic education access in 2012 was 95.9 percent for women and 94.5 percent for men. In 2013, access to secondary education favored women at 85 percent, versus 82 percent for men (CEPAL 2015).

However, when gender intersects with class and ethnicity, the gap between women and men increases. The highest illiteracy level is among indigenous women, 26.7 percent, in comparison with 13.7 percent among indigenous men. In rural areas and lower-income households, the main reasons for school nonattendance are "housework" duties for girls (96%) and "paid job" for boys (72%) (Ferreira et al. 2013, 34). College education access is clearly intersected by class, as 68.2 percent of women in urban

areas have completed this level of education; yet, only 46.2 percent of women in rural areas have been able to attend college (Ferreira et al. 2013).

Health

In the past 15 years, Ecuador has experienced a major increase in the public health system's budget. In the period 2000–2011, financing of this sector grew more than 1,000 percent, reaching 7.9 percent of the gross domestic product (GDP) in 2010 (Ministerio de Salud Pública de Ecuador 2012; OMS 2014). Between 2006 and 2010, medical consultations rose 171 percent, prescriptions increased 204 percent, and lab exams increased 134 percent (Ministerio de Salud Pública de Ecuador 2012).

The effort at strengthening the Ecuadorean public health system is consistent with the government's attempt to rescue the state's and its institutions' primary role. These achievements are part of a social preoccupation that seeks to improve the previously insufficient access to health care. The main expressions of this investment are new health centers built across the country and the upgrading of some existing facilities.

Access to Health Care

Despite Ecuador's expenditures on health care, access is still limited, and the existing network is far from ensuring a universal and efficient service for all citizens. The World Health Organization (WHO) recommends a minimum of 23 doctors per 10,000 inhabitants. According to Ecuador's Ministry of Public Health, in 2010, the country was close to achieving this goal with 21.4 doctors per 10,000 inhabitants (Ministerio de Salud Pública de Ecuador 2012). However, this number represents a deficit with respect to the recommended minimum. This deficit was accentuated in 2013 when WHO estimated that the number of doctors in the country had fallen to 16.9 per 10,000 inhabitants. At the same time, nursing and midwifery personnel increased slightly to 19.8 per 10,000 inhabitants (OMS 2014).

Despite the admitted poverty and social inequality, which are persistent characteristics of the region, more than 50 percent of the health care expenses in the country are paid by families (León 2007). In November 2014, the Instituto Ecuatoriano de Seguridad Social (IESS) registered more than 3 million affiliates (IESS 2014). Affiliates are those who pay to be members of the public social security which covers: health insurance, mortgage loans, and retirement pension. This reflects the pressure that the

government places on employers to affiliate their employees, as mandated in Articles 243 and 244 of the Penal Code, which define nonaffiliation as a felony. With the mandatory affiliation of domestic workers, the number of women affiliated to IESS increased as a result of this law. Even though IESS is composed of more than 3 million affiliates, when compared to Ecuador's population as a whole, this represents approximately just 21 percent of the population being affiliated to public health care; this shows that a truly equitable health system is still far from becoming a reality.

Maternal Health

In urban areas, 94.71 percent of births received medical assistance, contrasting with 83.87 percent of births in rural areas (INEC 2014). One aspect that is important to consider is the country's ethnic diversity and their attachment to some traditional ways of giving birth. These more traditional and culturally rooted practices used to be outside the conventional system of health. However, the current government is developing programs to incorporate ancestral knowledge and practices into mainstream public health care, but it has proven to be a difficult and complicated task.

The UN Development Programme highlights two persistent health problems preventing Ecuador's fulfilment of the Millennium Development Goals concerning women: maternal mortality rate (MMR) and teen pregnancy. Adolescent pregnancy was declared a priority and directly attended to by the Intersectorial National Strategy for Family Planning and Prevention of Teenage Pregnancy. This social program is directed by the government's Ministry Coordinator of Social Development, which received USD\$29 million in 2012 to design and implement strategies and campaigns geared toward sexual education, with an emphasis on teenagers. In a country with a rigorous veil of silence concerning, above all issues, sexuality, the initiative broke down many obstacles and achieved reasonably positive results. For example, the free distribution and promotion of birth control methods and contraceptives as well as social awareness campaigns in the media contribute to the fact that people are driven to talk about sex and teen pregnancy.

Still, access to information and contraceptive methods is a problem and a significant issue for many women. The most widely used contraceptive in the country is tubal ligation, but many health institutions require the husband's permission or set other barriers to practice the procedure, even though there is no law against sterilization

(*La Hora* 2011; *El Comercio* 2015a). In fact, both the constitution and the Organic Law of Health acknowledge women's right to freely decide their health and reproductive life. More specifically, Article 27, subsection B, of the Regulation to Regulate Access to Contraceptive Methods in the National Health System, explicitly prohibits "asking for the authorisation or the presence of the partner, a third person or a family member for the delivery of any contraceptive method, including the definitive ones" (Ministerio de Salud Pública 2013, 8). Institutional demand for a third party's consent when opting for tubal ligation, and the problems with its implementation, demonstrate that, in practice, women's reproductive rights are at risk of being violated by health care institutions.

These discriminatory practices have also been denounced regarding the distribution of emergency contraception, known colloquially as the morning-after pill. More often than not, private drug stores tend to ask for medical prescription. Women's organizations point out additional obstacles to rapid and efficient access in the public health system: "The need of an appointment for an emergency service, obligatory previous clinical history and the obligation to provide identity data" (Frente Ecuatoriano por la Defensa de los Derechos Sexuales y Derechos Reproductivos et al. 2013).

Women have a longer life expectancy than men, 79.5 years in the period 2015–2020, according to INEC (Ferreira et al. 2013, 45). The most relevant causes of mortality for women are "complications in pregnancy and childbirth," "maternal care related to the fetus and the amniotic cavity and possible delivery problems," and "pregnancies ending in abortion" (Ferreira et al. 2013, 48). The main causes of maternal death are "particular maternal diseases and complications during pregnancy, childbirth and postpartum" (Ferreira et al. 2013, 52). Postpartum hemorrhage and eclampsia are the second and third causes of maternal mortality.

Diseases, Disorders, and Tobacco Use

The main causes of death include diabetes mellitus and hypertensive and cerebrovascular diseases. The Health Ministry has pointed to the overconsumption of sugar, salt, and fats as risk factors for developing these diseases. In 2013, car accidents and diabetes were the main causes of death.

As for tobacco use, the INEC estimates that 4.6 percent of Ecuadorians at least 12 years old or more are smokers, and the majority (91.5%) of them are men. Women

comprise 8.5 percent of smokers, and the majority (90.8%) consume fewer than 150 cigarettes per month. While fewer women use tobacco regularly, those who do use it more than men (Arana 2013). The government has developed a strategy to reduce tobacco use and has seen tangible results. Some of the actions include prohibiting tobacco companies' media publicity and mandatory inclusion of health warnings on cigarette packages.

Employment Work and Pay

Ecuador is no exception in the global trend concerning employment. Parallel to the increase in women's participation in the labor market, there is a persistent wage gap between men and women. Women represent nearly half of the economically active population; yet, their income on average is 84 percent their male counterparts (INEC 2011).

Ecuador's labor market is heavily gendered; women make up 94 percent of domestic service workers, as opposed to men who represent a bare minimum of 2.02 percent. Further, women earn 59.4 percent of what men tend to make on average in the same sector. Other sectors in which women represent the majority are social services activities (68.3%), hotels and restaurants (65.8%), and teaching (61.9%). Men constitute an overwhelming average of 90 percent of laborers in the transport, communication, construction, and fishing sectors (INEC 2011).

Women's national average income is USD\$374 per month, a figure well below the national income of USD\$419 per month. This disparity is even greater among rural women who collect an average income of USD\$219 per month. In terms of domestic wage labor, rural women earn USD\$2 less per month than urban women. Rural men earn USD\$27 per month more than urban males, probably due to the surplus of cheaper labor in urban areas. Rural men make USD\$173 per month more than rural women. Some of the principal reasons for the inequality among urban and rural women are high illiteracy rates, racism, and a general lack of fair wage labor and job opportunities in the rural areas (CEPAL 2015).

It is important to note that, among ethnic groups, indigenous and Afro-Ecuadorian women (self-defined as such)—and although a minority—in general dedicate more hours on average per week toward work than other women (INEC 2011). This not only indicates an unequal distribution of labor but also highlights discriminatory cultural patterns characteristic of Ecuadorian society.

Women make up nearly half of the population dedicated to agriculture, which constitutes one of the largest sectors of economic activity. However, women are more likely to own less land than men, and data also indicates that 86 percent of women receive no wage for their agricultural occupation (CEPAL 2015).

Although women's participation in the national labor market has shown an increase in recent years, Ecuador lacks sufficient reliable statistical data regarding women's roles within employment and work. Women's invisibility in the workforce is due in part because they are ascribed traditional roles and tend to be relegated to the domestic space. The work performed in the domestic space is not only largely undocumented but also undervalued by Ecuadorian society in general. As a result, information regarding women's roles and the work that they perform is scarce and deeply marked by gender inequities.

Ecuadorians can take up to nine months of unpaid maternity or paternity leave (Export.gov 2017). Women are given 12 weeks of paid maternity leave by law and are allowed fewer hours of work per day (six hours per day) until the child is one year old. This policy for working mothers is aimed at facilitating, as well as promoting, breastfeeding. In comparison, fathers are allowed 10 days of paid paternity leave and an additional 5 days in cases of multiple or cesarean births. Worth mentioning is the fact that adoptive parents are only given 15 days each of maternity and paternity leave (Constitución de la República del Ecuador 2008). So while maternity and paternity leaves are supported by public policies, they weigh heavily on the conservative assumption that women make better caretakers than men.

Family Life

Housework

At approximately 8,087,914, Ecuadorian women represent over half of the country's population and nearly half of the national labor force (INEC 2014). Of all Ecuadorian households, almost 26 percent of them are headed by women, while the rest are headed by men. Although women increasingly participate in a diversity of sectors in the labor market, and only a quarter of all households are run by female heads of household, women still dedicate more time and energy on work than men (Consejo Nacional para la Igualdad de Género 2013).

According to the National Council for Gender Equality, if all Ecuadorian households were to hire someone

to perform their housework, it would amount to almost USD\$11 million per year. The reality is that women spend an average of 32 hours per week on housework, whereas men assume approximately 9 hours per week. Sustaining the household and the well-being of household members falls upon women regardless of their age (Consejo Nacional para la Igualdad de Género 2013).

Interestingly nonwage domestic labor has been calculated to contribute 15.41 percent to the national GDP, which is more than petroleum (9.29%), construction (9.35%), or commerce (9.41%). Also, women represent 13 percent of nonwage domestic laborers, as opposed to men who perform an estimated 2.3 percent of the same labor (Consejo Nacional para la Igualdad de Género 2013).

Ecuador's 2008 Constitution includes two significant articles that have just recently begun to affect the gender gap in terms of hours of work and wages. Article 333 states, "Non-wage labor, consisting of self-sustenance and human care work realized in the home, is to be recognized as productive labor." Article 325 establishes that the "State shall guarantee the right to work. All forms of work are to be recognized, be it autonomous or codependent, including self-sustenance and human care work; while also regarding workers as productive social actors" (Constitución de la República del Ecuador 2008).

Against this background, challenges to the wage gap have been made; yet, reforms have merely served to reiterate gender roles. It is not enough to recognize the productive value of nonwage labor, nor is it sufficient to include its quantification and social retribution in the national economic system. What remains unchanged is that the total hours of work per week for women is almost 78 hours, whereas men contribute 60 hours per week (Consejo Nacional para la Igualdad de Género 2013). Nonwage labor statistics are extreme, displaying a difference of almost an entire day's and night's worth of work per week. That women make up nearly half of the economically active population and spend more time working than men greatly impacts the wage gap and consequently threatens women's economic independence.

Even though there is legislation seeking to redistribute work and hours dedicated to family sustenance, data indicates, for example, that women who are married do more housework than single women. Also, the percentage of households headed by women is 28.7 percent; yet, female heads of household make an average of 77.9 percent less than male heads of household and tend to work 17 hours per week more than men that are heads of household. The

main reason behind what are sometimes double or triple shifts of work performed by women is a lack of men's participation in caretaking and house chores. Girls between the ages of 12 and 19, on average, do almost three times more housework than men. Whereas women between the ages of 20 and 29 do up to four times more housework than men (Consejo Nacional para la Igualdad de Género 2013).

Women who have more children experience greater violence than those with fewer children. Out of all the women without children, approximately 25 percent have been victims of gender violence, compared to mothers with seven or more children where 66.4 percent express having experienced gender violence. For many women, discrimination and abuse have early roots; overall, 83 percent of girls and female adolescents state they have suffered from domestic sexual violence (INEC 2011).

LGBTI Marriage and Adoption Rights

Same-sex couples are denied adoption rights, reflecting the general homophobic attitude displayed in Ecuadorian culture. However, the LGBTI (lesbian, gay, bisexual, transsexual, and intersexual) social movements and collective actions have made strategic advances. In December 2015, Ecuador passed a law making it possible for a person to choose to express their gender on their identification card once they turn 18. With this law, the category of "sex" is substituted by "gender" on the identification card of the person who chooses to do so (*El Universo* 2015). For the substitution, the law requires the person to prove that he or she has been living and expressing his or her gender for at least two years (*El Universo* 2016). The definition of the category "gender" is based on the same binary as "sex": masculine and feminine. This means that choosing to express "gender" over "sex" on the identification card is reduced to transgender people, which is understood as those identifying as the opposite sex of the one they were born with. By reducing the possibility to substitute "sex" for "gender" on the identification card to only transgender people, this law may produce greater stigmatization toward transgender people, as it creates a "special" identification card with the "gender" category for transgender people as opposed to the "normal" identification card with the "sex" category for the rest of citizens. However, this law can also be seen as a strategic advance for the LGBTI population because it has brought the discussion about gender and sexual diversity into the attention of the media and public agendas.

In regard to marriage, while couples of any gender can seek to be recognized as a legal union, only a man and a woman can be recognized in legal matrimony (CNN 2015). Apart from the economic benefits provided by matrimony—as opposed to a legal union—there are serious social issues that arise from the failure to recognize same-sex couples in legal matrimony. The implication for same-sex couples is that one parent is denied his or her right as a legal guardian of any children and may become subject to discrimination (*El Comercio* 2016). A well-known case in the country is the one of a British lesbian couple that have yet to be able to register their now four-year-old child who was born in Ecuador: "The Civil Registry has said that it can register the child, but on her identity card only the name of the woman who conceived her would appear" (BBC 2016).

Politics

Women have voted since 1928, four years after Matilde Hidalgo, the first Ecuadorian woman to graduate from high school and to become a physician, claimed her right in 1924. In 1928, the constitution established that all literate women could vote. This meant that most women who were poor and many who were indigenous could not vote until 1978 when the universal right to vote was granted to all men and women.

During the 1990s, women's movements and women inside the government exerted pressure on the Ecuadorian Congress to pass a Quota Act to be able to participate as candidates for public office. This quota, approved in 2000, promulgates that women should eventually represent half of candidates running for elections. This percentage was achieved in 2007 in the elections for the Constituent Assembly. In 2008, the Congress, now called the National Assembly, was made up of 124 assemblymen—of which 42 were women, reaching an historic 33.8 percent. Since 2013, after the presidential and legislative election, women represent 32 percent of the National Assembly. For the first time in Ecuadorian history, three women hold the presidency and two vice presidencies in the National Assembly: Gabriela Rivadeneira Burbano (1983–), Rosana Alvarado Carrión (1977–), and Marcela Aguiñaga Vallejo (1973–) (Secretaría Nacional de Gestión de la Política 2013).

The participation of women in other decision-making positions has increased in recent years. In the executive branch, female representation reaches almost 42 percent. Similarly, in the judicial function, it reaches 40 percent,

and in the Citizen Participation Council (a fourth branch of the state), women's participation exceeds 50 percent (*El Ciudadano* 2014).

Several national and local women's organizations exist, but there is no one unified national women's movement. Social, cultural, economic, and racial inequities keep Ecuadorian women from reaching a common agenda. As such, lesbian and transgender women often find it difficult to insert their particular demands into the agendas of women's organizations. Unfortunately, subtle or direct forms of exclusion and discrimination toward sexual diversity happen on a daily basis. There are also other structural factors affecting national women's unity: living conditions and the sexual division of labor in the capitalist economy and workload in general that especially affect rural and poor women. State intervention and its *quid pro quo* approach toward women's organizations and the internal complexities between being an autonomous organization and a mixed organization add to the challenge of forming a united movement.

Despite these complexities, there are some government autonomous women's organizations such as Luna Creciente and Asamblea de Mujeres Populares y Diversas that bring together several women's organizations at local and national levels. Also, El Foro de la Mujer and the Coordinadora Política de Mujeres maintain a regional reach. All of these regional organizations refer to themselves as feminist and have an indigenous base; they are self-defined as popular and part of the social and political left (*Observatorio del Cambio Rural* 2012). These and other women's, as well as mixed-sex, organizations often protest against gender and state violence and are committed to civil society and the environment (*El Comercio* 2015b).

In recent years, there have been many changes in laws and public policy that have affected women's rights. One of the most significant is the Organic Integral Penal Code (COIP). Among the issues that directly call out to women in this code are the ones related to sexual and reproductive rights, specifically on the grounds for legal abortion as well as the criminalization of "domestic violence" and "femicide."

The Penal Code prohibits abortions except if the mother's life is in danger or if the pregnancy is the result of rape of a mentally disabled woman. The possibility of making all abortions legal in the case of rape generated controversy during the process of approval by the COIP. Some female legislators presented a motion proposing the legalization of abortion in cases of rape. However, President Rafael

Correa stated that the government would never allow such apparent "sin against life." After punishing the same female legislators with a one-month suspension from the Assembly, Correa also said, "They can do whatever they want. I will never approve the legalization of abortion" (*El Universo* 2013). Correa is a self-identified Catholic, and some parties of the Catholic Church (e.g., the Opus Dei) head the pro-life opposition against the legalization of abortion.

For the first time Ecuador legislation considers "domestic violence" (also called "gender violence") a crime worthy of penal punishment. The code was recently approved in 2013. Previously, gender violence was treated as a misdemeanor.

Religious and Cultural Roles

In 2012, what is considered Ecuador's first official data representing religion became available. An opinion poll in five cities revealed that 91.95 percent of the population claimed to have one religion and most (80.44%) recognized themselves as Christian (INEC 2012a). These figures provide a hint of the cultural ideological system and roles accepted by the majority and, of course, the roles of women within the dominant system of belief.

As a part of the social doctrine of the Catholic Church, women have engaged in communitarian work with indigenous people and, in general, with disadvantaged segments of the population. Barely visible, this work represents an extension of the traditional role of the woman as a caregiver (Montero 2013).

In Ecuador, the dominant binary heterosexual gender/sex system is strongly supported by the role of the mother. Even at present, "family" continues to be the most frequent answer given by women to the question, "What is important in your life?" One poll shows that 46.27 percent of women placed family as the most important item in their life, even over work or health. Meanwhile, men said "work" with greater frequency (INEC 2012a). The representation of care as an exclusive responsibility of women, even at the level of public policies, continues to be an important aspect of this issue (Villamediana 2014).

The influence of the mother as a role model in cultural representations has been widely analyzed in terms of its impact on planned motherhood and sentiments of guilt about having abortions (Morales Alfonso 2015). This is a reflection of a society with remarkable features of sexism and machismo, whose influence threatens women's participation in the public sphere and their involvement in new roles that differ from those that society has traditionally

assigned to them. Ecuadorian institutions reproduce structural and systematic inequality as well as cultural conceptions concerning women's roles. This is made even more evident when women try to succeed in structures historically dominated by men, such as the army (Iturralde 2015).

Indigenous women have their own challenges when it comes to their empowerment and access to women's rights. Their struggle for political participation presents a challenge against a particular kind of essentialism referred to as Andean "complementarity" of men and women, in which women tend to be confined to preestablished roles within family structures. Indigenous women's interpretations of particular social and historical conditions, alongside the struggle of Afro-Ecuadorian women, enrich the thoughts and actions of women's and feminist movements.

Issues

In general terms, the main obstacle in the fight for gender equality is the fervent display of sexism, or machismo, that women and girls in particular are treated to on a daily basis. Misogyny and the subordination of women or their femininity in regard to men and their masculinity are a structural inequality affecting gender relations.

Violence against women persists as a critical issue. The National Survey of Family Affairs and Gender Violence against Women records that 6 out of 10 women say they have suffered some form of gender-based violence in their lifetime, and 1 in 4 women have experienced sexual violence; 40 percent of victims of sexual violence assume motherhood, and the other 60 percent have illegal abortions, risking their lives in the process (INEC 2012b).

For many scholars and activists of women's and feminist movements, recent laws and public policies have been interpreted as a step backward in terms of sexual and reproductive rights. For example, the responsibility concentrated in the Intersectorial National Strategy for Family Planning and Prevention of Teenage Pregnancy (ENIPLA) has been transferred to the presidency of the Republic of Ecuador. The transfer was an executive order that brought about a change in public policies, along with a name change to National Plan for the Strengthening of the Family. The plan looks at the issue from a normative view of the nuclear family.

The second major change generated polemics concerning the head of the national plan and her alleged links to Opus Dei, an ultraconservative wing of Catholicism. As a response, the National Coalition of Women started

a lawsuit due to the anticonstitutional character of the executive order. Despite such efforts, the Family Plan was enacted, and it eliminated most of ENIPLA's original approaches, one of which specifically recognized the problem of teen pregnancy as a societal concern instead of a problem of "family" or morality.

These changes embody what the president of Ecuador, Rafael Correa, has referred to as the threat of "gender ideology." Academically speaking, there is no such thing as "gender ideology"; nevertheless, it is interpreted by the government as a strategy by feminists to promote demoralization through sexual liberation (Correa 2013).

In Ecuador, abortion is condemned both morally and socially. As a consequence, there is a lack of research, documentation, and statistical information to shed light on the scope and nuances of abortion, including actual figures for morbidity and mortality. In 2012, "nonspecified" abortion was the second cause of morbidity for women (INEC 2013). Despite the lack of credible information and exact figures, the impact of this issue on women's health and their sexual and reproductive rights is widely recognized, if only by the fact that no abortions are ever documented unless it is due to penalization.

There are currently 58 cases reporting cruel treatment of women who have aborted; these cases are being presented before the UN Committee on the Elimination of Discrimination against Women (CEDAW) (*Plan V*, 2015a). The cases describe situations where women's rights have been severely violated by the authorities, but they also highlight the dangers women are exposed to when requiring access to abortion. Illegal clinics announce their services on all kinds of informal platforms; their high costs and unsanitary conditions expose the poorest women to danger and even death.

Ecuador's strict legal terms ultimately criminalize abortion, which by some authors has been interpreted as an act of femicide. In the last decade, pregnancies in girls between the ages of 10 to 14 have risen by 74.8 percent, and 46.5 percent of mothers have their first child between the ages of 12 and 19 (INEC 2010). The situation not only speaks of the torture that children are submitted to by being forced to give birth, but also the sexual violence that provoked the pregnancy in the first place. According to the National Council of Childhood, in Ecuador, there are approximately 3,600 girls under the age of 15 that have been victims of rape in which motherhood was forced on them (Ribadeneira 2016).

Another relevant issue is the return of out-migrants since 2012. Many of them abandoned the country in the

1990s due to the economic crisis in which several banks were bailed out by the government and many people lost their savings. The Return Plan was specifically designed for Ecuadorian out-migrants in Spain to create conditions for an adequate reinsertion in society. Though the reasons for deciding to go back home may vary, the economic crises in host countries is a deciding factor. Also, the return of women tends to be linked to their responsibility as caretakers of their own families in Ecuador, instead of solely responding to entirely external factors. Many of them integrated global networks of care to meet the needs of their families, and their return places them in the same roles, complicating their social reinsertion (Redrobán 2014).

Sexual harassment has been present in the public agenda in recent years, especially in Quito. In 2010, the capital city of Ecuador was one of the five cities in the world selected for the UN pilot initiative Safe Cities and Safe Public Spaces framed by the program Safe Cities, Free from Violence against Women (along with Cairo, New Delhi, Port Moresby, and Kigali). The main goal is to become a gender-inclusive city and to promote women's rights in the city, but it is far from that achievement, as was debated in Habitat III, the UN Conference on Housing and Sustainable Urban Development, which took place in Quito in October 2016. Nevertheless, the national government in alliance with local authorities has implemented policies to fight sexual harassment in public places, especially on public transportation. Studies had previously demonstrated high rates of harassment that women experienced in this context and the consequent modifications made to their dress, behavior, fear levels, and lives in the city.

The Municipality of Quito implemented a protocol of attention to women who suffered sexual harassment, which allowed them to file a complaint against the aggressor with the assistance of transportation employees and other functionaries of the entities involved (Patronato Municipal San José y ONU Mujeres 2014). This has made possible a few high-profile cases that ended with judicial sentences for the aggressors (Fiscalía General del Estado 2015).

This policy faces many manifestations of cultural patriarchal resistance and is a significant step forward to overthrowing naturalized manifestations of violence against women in public spaces, which are typically justified by Ecuador's culture of machismo. It also translates to Ecuadorian discussions about sexual harassment that are absent from other Latin American scenarios, where other forms of violence receive all the attention (Morales, Quiroz, and Ramírez 2016). In addition to the inclusion of

femicide in the penal code, this contributes to making various forms of violence against women in Ecuador visible.

El Salvador

Overview of Country

The Republic of El Salvador is the most densely populated and, at 13,074 square miles (21,041 sq. km), the smallest country in Central America. Guatemala borders it to the north, Honduras to the east, and the Pacific Ocean to the west. It has a tropical climate, and much of the land is considered agricultural. El Salvador is also prone to earthquakes, hurricanes, and volcanic activity, which sometimes result in widespread destruction and has led to the country being called the "Land of Volcanoes."

The capital of El Salvador is San Salvador, and the official language is Spanish. The country became a Spanish colony in 1540 and did not gain independence from Spain until 1821. During the 19th and 20th centuries, the country went through periods of political instability coupled with socioeconomic inequality. In 1932, 10,000–30,000 individuals were killed in a peasant uprising against the upper class, known as *La Matanza*. Indigenous peoples in western El Salvador joined with local communists to protest ethnic persecution by ladinos (landowners), depressed coffee prices, and the militarized government (Silber 2011; EAAF 2007). Even more would die in 1979, as El Salvador became embroiled in a 12-year civil war stemming from persistent socioeconomic inequality and harsh military rule. This war led to about 75,000 people being killed and ended only when the government and the leftist rebels signed a reform treaty in 1992 (CIA 2015). Since then, the government has stabilized and now operates as a democratic republic.

As of 2015, there are a little more than 6 million inhabitants, with women constituting a slight majority (World Bank 2015b). These individuals are 86.3 percent mestizo, or a mix of Spanish and indigenous populations, including the Nahua-Pipils, Lencas, and Kakawiras, along with a population that is 12.7 percent white; the rest identify as

indigenous or black. El Salvador has a young and largely urban population that is on average 26 years old (CIA 2015).

As for the economy, the country's gross domestic product (GDP) in 2014 was USD\$51.19 billion, ranking it 108th out of 230 countries. While the economy has recently slowed, El Salvador has the fourth-largest economy in Central American due in large part to exports to the United States (CIA 2015). Since the 19th century, the country has been particularly dependent on the production of coffee and sugar, with the land of the indigenous people of El Salvador being transferred to primarily 14 coffee-producing families called *las catorces*. About 16.5 percent of the GDP stems from remittances sent back to families from Salvadorans who immigrated to other countries, primarily the United States (Cohn et al. 2013).

Overview of Women's Lives

In terms of gender equality, El Salvador is ranked 116th out of 188 countries on the Gender Inequality Index (GII), which is a decline in the country's ranking of 91st from the previous year. Indeed, El Salvador falls short on several indicators of gender equality, including women's underrepresentation in parliament along with lower levels of education and workforce participation (UNDP 2015). Even so, the government has made gains in recent years due to the passage of legislation aimed at improving women's lives by enhancing education, increasing access to health care, and creating a more equitable workplace.

Girls and Teens

The female population makes up 53 percent of the total population (World Bank 2015b). Males outnumber females up to the age of 20 years old. Then the gender balance reverses, and females outnumber males because of the higher rate of death for males during the country's civil war (Alves et al. 2013). Yet, there are many young females under the age of 18 that make up about 23 percent of the country's population (CIA 2015). These girls and young women often have lives that are marked by poverty, violence, and a struggle to achieve gender equality in areas such as education and, eventually, the workforce.

Literacy

When it comes to literacy rates, teenage girls and young women in El Salvador have a high literacy rate. In fact,

females between the ages of 15 and 24 have a literacy rate of 96.4 percent, which slightly exceeds the 95.7 percent literacy rate seen among males in the same age range. At 84.5 percent, literacy rates for adult Salvadorans is lower (UNICEF 2013). This has led the Ministry of Education to spearhead the National Literacy Programme, which contends it has taught 200,000 people to read and write since 2009 (Ayala 2015). The result is a drop in illiteracy to 11.8 percent among Salvadorans. Even though women still make up an estimated 7.3 percent of illiterate Salvadorans, the Ministry of Education projects that, with their continued efforts, the country will have literacy rates of 96 percent or greater by 2019 and will be declared free of illiteracy (Ayala 2015).

Child Abuse

Child abuse is widespread in El Salvador, especially sexual abuse (U.S. Embassy in El Salvador 2015). According to UNICEF, more than half of the children in Central America are subject to emotional, physical, or sexual abuse (2013). This abuse is often conducted openly. More than one-third of Salvadorans know a child who has suffered verbal or emotional abuse by a family member. Yet, Salvadorans underreport the physical abuse of children, as a majority lack confidence in the authorities to solve the problem (English and Godoy 2010). Victims also fear reprisal, such as sexual assault, for reporting crimes to the authorities, and they face societal pressure to remain silent about such crimes. In response, the Salvadoran Institute for Children and Adolescents (ISNA) has opened shelters for abuse victims who are minors, and it has launched a violence-awareness campaign in an attempt to curb child abuse (U.S. Embassy in El Salvador 2015).

Teenage Pregnancy

When it comes to teenage pregnancy, El Salvador has one of the highest teen pregnancy rates in all of Latin America (Moloney 2014). In fact, there is an adolescent birth rate of 79 births for every 1,000 adolescents between the ages of 15 and 19 (UNDP 2015). While many of these births are due to consensual sex, some result from family or gang members who subject teenage girls to sexual abuse and rape, and because abortions are illegal, teen girls must carry their pregnancies to term (Moloney 2014). An estimated two-thirds of rapes in 2014 were committed against minors (Arce 2014), and about 41 percent of first-time

pregnancies for females between the ages of 10 and 19 resulted from rape (U.S. Embassy in El Salvador 2015).

Pregnant teenage girls are often rejected by their families and banned from coming to school, as it would set a bad example for other teenage girls. This situation leads an increasing number of teenage girls to commit suicide, causing teen pregnancy to become a leading cause of suicide; three out of eight maternal deaths are suicides by pregnant teenagers. To address this growing problem, the Ministry of Health recently formed an alliance with “government bodies, doctors’ associations, and international aid agencies” who view bringing boys and men into the alliance as key to preventing teenage pregnancy (Moloney 2014).

Education

Public, secular education is managed by the Ministry of Education and is compulsory up to the ninth grade. However, rural areas of the country often do not have the resources to provide all children with the education required by law. Many parents in these areas remove their children from school to work and contribute to the family’s income (U.S. Embassy in El Salvador 2015). The dropout rate for girls has historically been higher than for boys (Ayala 2015), and so girls have had fewer years of schooling overall (Macias et al. 2012). An additional explanation for this education gap is the machismo culture in which the education of boys is considered more important than the education of girls (Ayala 2015). Recent strides have been made to ensure gender parity, and now girls often surpass boys’ attendance (UNICEF 2013).

Primary and Secondary Education

In terms of free and mandatory education, the Salvadoran government offers primary education, which consists of nine years and starts when a student is seven. Males and females are enrolled in primary school at the same rate, about 96 percent (UNICEF 2013). Moreover, females appear to be more successful than males in primary schools, with females less likely to fail or repeat a grade than males (Education Policy and Data Center 2014). Secondary education, which lasts for two to three years, depending on whether vocational training is involved, is not mandatory. While many students do not continue their education past primary school, about 61 percent of females and 59 percent of males enroll in secondary school (UNICEF 2013).

Primary schools, particularly in rural areas, have a history of being underfunded. Only 3.4 percent of the

country’s GDP has been dedicated to education, which fails to meet many of the country’s educational needs (UNICEF 2013). This has led many schools to share resources and to allow students to attend neighboring schools for extracurricular activities or to complete their secondary education, as some schools do not offer it (Renderson 2012). President Sanchez Ceren, who was a teacher for a decade, has placed a greater focus on education since his 2014 election. For instance, the current government has given basic school supplies and computers to students to help families with the expense of school and keep students from dropping out (Cejo 2015).

Higher Education and Job Training

Higher education is available through 23 private universities and the largest and only public university, the University of El Salvador. There has been a steady increase in enrollment at the university level in recent years. Of the students enrolled, women make up the larger share of the student population. Out of the 163,607 students enrolled, 54 percent are female, and they are more likely to graduate than their male counterparts (Ministerio de Educacion 2014). USAID noted that there is continued gender stereotyping at the university level that steers women into areas that reinforce traditional female occupations such as nursing, causing a gender gap in the labor force (2013). As part of receiving funding from USAID, an emphasis is placed on reducing such stereotyping to achieve greater gender equity in higher education and the economy (USAID 2013).

El Salvador’s higher education system also includes specialized and technological institutions. These institutions focus vocational training and enroll about 13,000 students, with men having slightly higher enrollment than women (Ministerio de Educacion 2014). The Ministry of Education has recently sought to expand vocational training to women. Along with nongovernment organizations (NGOs), the ministry has reached out to women, particularly those in rural areas, to give them vocational training to prepare them for employment beyond domestic labor (USAID 2013). The U.S. Bureau of International Labor Affairs has also contributed to these efforts with their pledge of \$13 million to train both Salvadoran and Honduran at-risk youth in developing valuable work skills and assisting them in finding employment (USDOL 2015). These individuals who would otherwise not receive a higher education are being taught necessary skills to move them into the formal workforce.

Health

Although health conditions have improved, poverty brings with it limited access to health care and proper nutrition (World Bank 2011). Governmental health expenditures currently make up less than 7 percent of the entire GDP of El Salvador. Despite this, men are expected to live for 71 years, while women have an estimated life span of 78 years (CIA 2015).

Access to Health Care

In 2009, the government began to reform its health care system to achieve universal health care by increasing the Ministry of Health's budget. In doing so, El Salvador is creating a system based on health care as a "public good and a fundamental human right" (WHO 2014). However, access to health care continues to be more limited in rural areas due to a lack of nearby government health centers. There is also overcrowding at government health centers and a continued lack of resources to treat patients (FIMRC 2015). Patients often have to pay for supplies such as syringes to be treated at one of the government's free health centers. This has led to medical personnel requesting that the government raise taxes on the wealthy to pay for the underfunded program and to ensure universal access to health care for all. Yet, even with these setbacks, new clinics staffed by doctors and nurses along with laboratories and emergency rooms have been established, particularly in rural areas, and infant and maternal mortality rates have been cut dramatically due to increased access to medical care (Bloom 2012).

Maternal Health

Fewer babies are being born in El Salvador. The birth rate has dropped significantly in recent years in conjunction with the increased usage of birth control methods. Today, there is an average of 1.91 children born per woman, which places the country on similar levels as the United States. Yet, low birth weight and child mortality is problematic; about 9 percent of babies are born underweight, and the child mortality risk for children under five years old is estimated at 11.2 percent. Even so, child mortality rates have decreased in recent years, and there has been a 50 percent decline in deaths among children under age five. Maternal deaths have also decreased due to better access to health care. Antenatal care is on the rise, with 94 percent of women reporting at least one antenatal visit to

a health care professional. There is also increased use of a skilled attendant during the birthing process. About 96 percent of women have trained personnel during delivery. This has caused an increase in cesarean births beyond the recommended rate; about one in four children are born via C-section. Current reports show 54 maternal deaths for every 100,000 live births in El Salvador (CIA 2015; UNICEF 2013).

Abortion

Since 1998, abortion has been illegal in all cases in El Salvador, and women face two to eight years in prison if convicted of having an abortion (Amnesty International 2015b). Thus, the health and safety of pregnant women are put at risk from both illegal abortions and dangerous pregnancies that could be life-threatening. Furthermore, those who fail to deliver a live baby are often accused of having had an abortion. Hospitals may report women who miscarry what are deemed viable fetuses or give birth to still-born babies to the police, which may cause these women to be prosecuted for aggravated homicide with a possible sentence of 50 years (Amnesty International 2015a).

Recently, several women's rights campaigns, including the Center for Reproductive Rights and Agrupacion Ciudadana, have sought to free 17 women, Las 17, who were imprisoned for aggravated homicide and sentenced to 30–40 years for reported miscarriages (Ford 2015). Recently, one woman was pardoned because of a lack of due process in her case; the other 16 women are waiting to have their cases reconsidered as well (Guevara-Rosas 2015). These events led women's rights groups to increase pressure to eliminate strict abortion laws altogether, but the government has given no indication that the laws will be repealed (Ford 2015). Moreover, the public has shown limited support for changing abortion rights. A recent study found that only 10 percent of Salvadorans demonstrate support for legalizing abortion in all or most cases, and 93 percent view abortion as morally wrong (Pew Research Center 2014b).

Reproductive Rights

While the rate of birth control usage has increased dramatically, access to and usage of contraceptives are still limited. For instance, sex education in schools is limited, and access to contraceptives is not readily available, both due in part to the Catholic Church's influence (Moloney 2014). A recent survey of Salvadorans revealed that 45 percent view the usage of contraceptives as morally

wrong (Pew Research Center 2014b). While 72.5 percent of married women between the ages of 15 and 49 use contraceptives, more than 1 in 4 do not use contraceptives to prevent unwanted pregnancies (UNICEF 2013). This gap in contraceptive use appears to be even more pronounced for those who are poor and live in rural areas where contraceptives may be difficult to obtain (Siow 2009). The lack of birth control usage appears to be due to availability and religious conviction rather than government regulations.

Diseases and Disorders

El Salvador suffers from a lack of proper sanitation facilities, which promotes infectious diseases in the country. Overall, 70 percent of Salvadorans have access to improved sanitation facilities; however, among rural residents, just 52.6 percent have access (UNICEF 2013). This, in turn, often leads to contaminated food and water and has caused a high risk for diarrheal diseases (CIA 2015). The Centers for Disease Control and Prevention (CDC) recommends travelers get vaccinated for hepatitis A and typhoid before going to El Salvador, as there is a risk of contracting these diseases through contaminated food or water (CDC 2015).

There is also a risk of dengue fever and Zika virus caused by mosquito bites in this tropical climate (CIA 2015). The CDC recently warned pregnant women about traveling to El Salvador and the surrounding countries due to possible birth defects that can occur to children born of mothers who were infected with the Zika virus while pregnant. Chief among these defects is microcephaly, a rare condition that results in children being born with small heads and brains. As the country struggles to reduce the number of Zika cases, El Salvador has urged women of childbearing age to wait at least two years before getting pregnant to prevent birth defects (Mohney 2016).

Another health concern is the lack of nutrition; chronic malnutrition affects almost one in five children under the age of five, which can lead to long-term health effects and even death (UNICEF 2013). At the same time, there has also been an increase in obesity among children and women; 80 percent of women over the age of 40 are classified as overweight (World Bank 2011). This, in turn, may lead to greater health problems for women as they age.

Cervical cancer is another health concern for women, as it is the leading cause of cancer deaths among Salvadoran women. To address this issue, the Ministry of Health launched a program in 2012 to provide cervical cancer screenings to women with limited access to health care.

The lower-cost swab screening resulted in an estimated 30,000 Salvadoran women being screened for cervical cancer by the end of 2015. With these additional screenings, more women can be treated for cervical cancer, which is expected to lead to a decline in deaths from this disease (Basic Health International 2015).

While cervical cancer rates are still high, HIV/AIDS rates in El Salvador are relatively low: only 0.6 percent of the population has HIV. However, just 27 percent of young women between the ages of 15 and 24 years old have comprehensive knowledge of HIV and how to prevent its spread (UNICEF 2013). Those with HIV/AIDS suffer from discrimination and may be refused employment or fired if their status is known, even though this is illegal under Salvadoran law (U.S. Embassy in El Salvador 2015).

Employment

The government of El Salvador uses the U.S. dollar as its currency. Currently, El Salvador's GDP is about USD\$51 billion, but its economy continues to lag following the 2008 global economic downturn. From 2010 to 2014, the GDP grew about 2 percent. The government deficit has also been growing; the proportion of GDP associated with debt reached 59 percent in 2014 (CIA 2015). In 2009, the government adopted an anti-crisis plan to stimulate economic recovery by devoting USD\$600 million to social welfare programs and other programs to strengthen the country's public finances. The small gains made in the economy since have resulted in decreased poverty rates from a high of 40 percent in 2008 to about 30 percent in 2013 (World Bank 2014).

About 2.8 million Salvadorans participate in the workforce, and the country has an estimated unemployment rate of 6.2 percent (CIA 2015). Of those currently in the workforce, about 66 percent are employed in the informal economy, for example, selling various goods on the streets and not earning steady wages (ILO 2012). Although the gap is shrinking, more men are currently employed in the workforce than women (Bell 2013). Also, about 1 in 10 children between the ages of 5 and 14 are employed in various levels of economic activity or domestic service (UNICEF 2013). While most of this employment is voluntary, there have been reports of the forced labor of men, women, and children in "agriculture, domestic servitude, and the informal sector" (U.S. Embassy in El Salvador 2015).

Workers are also affected by free-trade agreements, specifically the United States–Central America Free Trade Agreement (CAFTA), which went into effect in 2006. At its

passage, proponents argued that it would create jobs and bolster the economy along with curbing gangs, drugs, and undocumented immigration (Perla 2016). While the country's GDP has increased since CAFTA's passage, cheaper agricultural products imported from the United States have undermined the ability of Salvadoran farmers to compete. This, in turn, has forced these once rural agricultural workers to look for work in urban areas. However, employment has become more difficult to obtain in these areas due to rapid urbanization and the influx of workers seeking employment.

Women in the Economy

With only 48 percent of women aged 15 and over participating in the labor force, more men than women are considered workers in El Salvador's economy (World Bank 2015a). Of those, over half labor in the informal economy, which are jobs that often lack stable incomes and benefits (Gelb and Palley 2009). Women in the formal economy face challenges such as being employed in low-wage jobs in domestic service and *maquilas*, or factories, and they face "exploitation, mistreatment, verbal abuse, threats, sexual harassment, and generally poor working conditions" (U.S. Embassy in El Salvador 2015). These workers are also subjected to violations related to wages, work hours, and safety and are not allowed to form a union to address the workers' needs (U.S. Embassy in El Salvador 2015). Such factories typically pay wages that keep families below the poverty line, have unsafe and abusive work environments that mandate workers labor overtime, and threaten employees with the loss of employment or pressure workers to excessively increase their production (IGLHR 2011). The passage of CAFTA, with its unenforced labor code, has not improved the abusive working conditions and appears to have worsened the situation due to the increased competition to produce cheaper goods (Campanile 2005).

Women also face other challenges in the workplace. For instance, women may be sexually harassed by their employers or coworkers. The government of El Salvador requires employers to implement measures that decrease the prevalence of sexual harassment, but the government has not enforced these laws to protect female workers. Pregnancy is also an issue for women workers. Some employers require pregnancy tests before hiring, and women may be fired for becoming pregnant. While employers may be fined and imprisoned for discriminating against women in employment, few employees report such discrimination for fear of reprisal and with the knowledge that these laws

are not being enforced by the government (U.S. Embassy in El Salvador 2015).

Salvadoran women earn less than men with the same job, particularly in urban areas (Macias et al. 2012). Men are also more likely to receive jobs and promotions than similarly situated women (U.S. Embassy in El Salvador 2015). Yet, a slight majority (55%) of Salvadorians are not in favor of men receiving preference over women in relation to jobs (Macias et al. 2012). Reflecting this belief, El Salvador's government recently implemented programs to teach women valuable work skills and help them transition into the formal economy (USAID 2013).

Family Life

When it comes to the family, men are traditionally the dominant figures in the household, as El Salvador, like many Latin American countries, has a culture that emphasizes machismo, or male power. In a recent survey, 71 percent of Salvadoran males and 65 percent of females agreed that women should be obedient to their husbands (Pew Research Center 2014b). Salvadoran marriages tend to occur at a young age. Girls can legally marry as young as 14 years old (U.S. Embassy in El Salvador 2015). By the age of 15, 5 percent of teen girls are married, which increases to about 25 percent by age 18 (UNICEF 2013). Many Salvadorans enter into nonmarital unions and have children without marrying. These couples are allowed the same property and child custody rights as married couples after three years of cohabitation (USCIS 2000). Regardless of whether they are married, girls and young women are often expected to occupy their time in domestic labor, and a greater emphasis is placed on their taking care of the children and the home. However, staying at home and engaging in domestic labor may not be financially feasible for some women because about one-third of Salvadoran households are headed by single mothers (Centre for Intercultural Learning 2009).

Marriage and LGBT Rights

Same-sex relations in El Salvador are not considered illegal. However, same-sex couples do not have the same rights as heterosexual couples. El Salvador's Constitution defines marriage as being between a man and a woman, denying same-sex couples the right to marry (Forgie 2011, 199). Several attempts have been made to amend the constitution to ban same-sex marriages, but each attempt has failed to achieve the necessary votes in the legislative assembly

(200). Civil unions for same-sex couples are also not recognized, and the government gives no appearance of providing same-sex couples with legal recognition (205). Furthermore, adoptions by same-sex couples are prohibited; only heterosexual married couples may adopt children.

This lack of rights stems in part from Salvadorans' lack of support for the LGBT community. For example, in a recent survey, only 11 percent of Salvadorans supported legalizing same-sex marriage (Pew Research Center 2014b). This lack of support extends to family members, as many in the LGBT community have been disowned by their families. Members of the LGBT community have also been subject to violent attacks. In the previous eight years, at least 145 LGBT individuals were killed. Many of these attacks have been carried out by the police or soldiers and are often not investigated by the attorney general (Mackey and Moran 2014).

In response to the attacks on LGBT individuals, former president Mauricio Funes established the Sexual Diversity Directorate to prevent discrimination against the LGBT community, and he issued Executive Decree 56, which outlaws discrimination based on sexual orientation or gender identity (Mackey and Moran 2014). A hotline was established for members of the LGBT community to call to express concerns about their rights and to request assistance against discrimination (U.S. Embassy in El Salvador 2015).

Recently, some rights have been granted to some within the LGBT community. For example, transgender people received the right to vote for the first time in El Salvador by the Supreme Electoral Tribunal (Mackey and Moran 2014). There is also a movement to replace the masculine term *Latino* with *Latinx* to promote the inclusion of women, non-binary, and transgendered individuals (Scharron Del-Rio and Aja 2016). Thus, while the LGBT community remains a target of discrimination and hate crimes, there have been some positive developments. Furthermore, discrimination against the LGBT community may become less pronounced in the near future. Younger Salvadorans demonstrate greater support for the rights of same-sex couples than older Salvadorans, indicating a change in attitudes toward the LGBT community (Pew Research Center 2014b).

Politics

El Salvador is a democratic country with a representative government that has executive, legislative, and judicial branches. The legislative branch consists of a unicameral Legislative Assembly with 84 members. Representation in the government is open to Salvadorians of both genders,

with 23 women, or 27.4 percent, serving as members of the legislative branch. Furthermore, 6 out of the 15 members of the current Supreme Court are women. While there has never been a female president in El Salvador, 3 of the 13 members of the current executive cabinet are women (U.S. Embassy in El Salvador 2015). Between 2004 and 2009, Ana Vilma de Escobar served as El Salvador's first female vice president, representing the right-wing Nationalist Republican Alliance (ARENA) party.

Beginning in 2015, an amendment to the Law of Political Parties required that a party's candidates for national, subnational, and Central American Parliament be 30 percent female, which is expected to increase female representation (IIDEA 2015). Diasporic Salvadoran women's participation in the political process extended the Legislative Assembly's passage of a law allowing Salvadorans living abroad to vote in national elections (Mills 2013).

Participation in Government

There is universal voter participation for those 18 and older. Women gained the right to vote in 1939, but they have continued to lag behind men in political participation. A little over half of the registered voters in El Salvador are women (IIDEA 2015). Yet, in the 2012 elections, about 67 percent of women reported voting, compared to 69 percent of men. Furthermore, women have been found to be less likely to contact political representatives or volunteer for campaigns (Macias et al. 2012).

In addition, younger Salvadorans are less likely to participate in elections. This stems in part from the greater likelihood that they lack a citizen ID card or birth certificate, which are necessary to vote in elections. Yet, younger men and women have similar levels of political knowledge and express greater interest in politics than older Salvadorans. This indicates that younger Salvadoran men and women could be mobilized to engage in politics if barriers were removed. However, it may be more difficult to mobilize young females to vote than young males. Women cite "issues of security, violence, and crime" as reasons for not going to the polls and engaging in the public sphere, while men do not view safety as an impediment to participation (National Democratic Institute 2009).

Legislation

In 2011, El Salvador passed the First Comprehensive Law for a Life Free of Violence against Women to address the violence occurring against women. The law includes measures

aimed at preventing violence in all forms and assisting victims (UNDP 2011). Despite this passage, Amnesty International found that the law is not being appropriately implemented due to a lack of funding and continued bias against women demonstrated by government entities, especially the judicial system (Amnesty International 2014).

Additional legislation has been enacted to improve women's lives. In 2011, the Law of Equality, Fairness, and the Elimination of Discrimination against Women "improved the judicial framework for the protection of women's rights," provided for equal pay for equal work, and ensured titular rights for land belonging to rural women (UN Women 2011). Without the work of several women's rights groups in El Salvador that came together to create this law and extensively lobby the Legislative Assembly to ensure its passage, it would not have become a reality (UN Women 2011).

Religious and Cultural Roles

While there is no official state religion, the major religion in El Salvador is Roman Catholicism. However, Evangelical Protestantism is growing rapidly; 40 percent of Salvadorans identify as Evangelical compared to 50 percent who identify as Catholic. Salvadoran women are more likely to identify as both Catholic and Protestant than men. At the same time, the number of those who are unaffiliated has also grown; about 1 in 10 Salvadorans do not have a religious affiliation (Pew Research Center 2014b). A small percentage of Salvadorans practice indigenous religions (U.S. Embassy in El Salvador 2015). This movement away from Catholicism is a more recent trend, as 93 percent identified as Catholics in 1970 (Pew Research Center 2014b).

The long history of the Catholic Church has strongly influenced society. The Catholic Church is the only church recognized in El Salvador's Constitution; it is given special legal status (U.S. Embassy in El Salvador 2015). The teachings of the Catholic Church are also evident in the country's more conservative culture: most Salvadorans view premarital sex, abortion, same-sex marriage, divorce, and the consumption of alcohol as morally wrong (Pew Research Center 2014b). The Catholic Church has likewise exerted its influence over the country's laws, particularly in relation to making abortion illegal regardless of the circumstances and even blocking a sex education manual for students (Moloney 2014).

Syncretism

While El Salvador's indigenous population is small, their religious practices have influenced the religious practices

of other religions, particularly the Catholic Church, and have led to a blending of religions (U.S. Embassy in El Salvador 2015). Many Salvadorans believe in aspects of Afro-Caribbean, Afro-Brazilian, or indigenous religions. The most popular belief concerns the evil eye. In a recent survey, 46 percent of Salvadorans stated that they believe in the evil eye, which maintains that individuals "can cast curses and spells that cause harm" (Pew Research Center 2014a). As for level of engagement in indigenous religious practices, 34 percent indicated that they had engaged in at least three indigenous beliefs or religious practices, which included "belief in the evil eye, reincarnation, witchcraft or sorcery, communicating with spirits, offering food, drinks, or flowers to spirits, participating in spiritual cleansing ceremonies, consulting traditional healers, and experiencing black magic" (Pew Research Center 2014a).

Quinceañera

In many Latin American countries, including El Salvador, many Catholic girls have a quinceañera celebration on their 15th birthday to mark their transition to womanhood. During this celebration, the girl's family typically has a mass and a blessing in which the girl commits her life to Christ and the church. Afterward, she is presented to the community as a young woman, and a fiesta in her honor usually follows. This celebration can be very expensive for the families; some save for years and accept donations to make the celebration possible. The cost can resemble a wedding, which places a burden on the family, and has caused the Catholic Church to recommend cost-cutting measures (U.S. Conference of Catholic Bishops 2016). Even with cost cutting, families living in poverty often cannot afford to celebrate a quinceañera, so this coming-of-age ceremony is primarily celebrated by wealthier families who can afford the expense of the ceremony and fiesta (*Unbound* 2012).

Issues

While El Salvador is striving for greater gender equality in such areas as education, health care, political participation, and the workforce, there are larger societal problems. Violence associated with gangs and underlying social inequality threaten to undermine civil society and have proven especially difficult for the government to address, particularly as it relates to women.

Gangs and Violence against Women

Crime and violence rates are considered high throughout the country, and the police appear to lack the necessary resources to properly enforce laws. While much of the crime centers on theft and extortion, gangs, particularly the Mara Salvatrucha (MS-13) and the Eighteenth Street (M18) gangs are responsible for most of the crime in El Salvador. Escalating gang violence, stemming from an estimated 60,000 gang members, has caused El Salvador to have the second-highest per capita murder rate in the world (Arce 2014) and the highest femicide rate in the world. Femicide is defined as “a crime involving the violent and deliberate killing of a woman” (UN Women 2013). Indeed, many of the crimes committed by these gangs involve young women that gang members had abducted and raped and then either murdered or threatened to do so to ensure their silence (Arce 2014). In doing so, gang members are able to exert further control over neighborhoods by using rape and murder as weapons to terrorize residents.

In response, many young women lock themselves away at home to protect themselves (McEvers and Garsd 2015). Yet, some young women who have been subjected to gang rape have managed to flee the country and have sought asylum in the United States (Arce 2014). Indeed, many minors have escaped to the United States in recent waves of unaccompanied minors hoping to find a safe haven from the violence that is a part of their everyday lives. As of 2015, it is unlikely that many of these minors will be allowed to stay in the United States. They will be sent back to El Salvador and the brutality of gang violence, which the police contend takes Salvadoran girls lives daily (McEvers and Garsd 2015).

Some young women perpetuate violence as gang members. These female gang members are argued to be “violently exploited and heavily relied on by male gang members” (Cawley 2013). They are typically viewed as less suspicious to the police, which means they are often tasked with carrying out criminal activity such as drug smuggling and extortion, but they are also expected to carry out gender-specific roles by cooking and taking care of the children and men in the gang. These young women may also be subjected to gang rape as part of the gang’s initiation process and may be killed if they try to leave the gang. These women become both the perpetrators and victims of violence after joining gangs, as male gang members exert their power over women both outside and within the gang (Cawley 2013).

Social Inequality

Social inequality remains a challenge in El Salvador. Even though the poverty rate has declined, it is still high. Women are more likely to earn less than men, which contributes to women’s poverty. In fact, women earn about 57 percent of what men make for the same job (U.S. Embassy in El Salvador 2015). Furthermore, there is a large gap in the distribution of income between the poorest and wealthiest Salvadorans (Tardanico 2008). While it is estimated that about 30 percent of Salvadorans live in poverty, those in the top 20th income percentile control almost 50 percent of the country’s wealth (World Bank 2013). At 66 percent, a majority of Salvadorans see this income gap as a major problem for the country (Pew Research Center 2014b).

Jobs are scarce, leading many young people to a life of crime and imprisonment. Few of the country’s finances are allocated to social programs, worsening the gap between the wealthy and the poor (Tardanico 2008). This has contributed to about one-fourth of the population leaving El Salvador, with most relocating to the United States. Remittances from abroad sent to family members now constitute one of the country’s major sources of income (Beaubien 2009). However, many still live in shacks and subsist on low wages.

UN Secretary-General Ban Ki-moon recently praised El Salvador for its progress following the peace treaty, but he urged the country to address its social inequality, as such inequality was the root cause of the civil war that plagued the country for over a decade (UNNS 2012). Many factors stymie efforts to create more social equality, including “intense urbanization, severe deficiencies of housing and basic infrastructure, environmental destruction and vulnerability to natural hazards, precarious employment, pervasive fear of violence and crime, and elite resistance to inclusionary politics” (Tardanico 2008).

Women in El Salvador have made recent gains in achieving more equality in areas such as education, health, employment, political participation, and violence against women, in part due to the government’s New National Policy on Women 2005–2009, though additional progress is needed (OHCHR 2008). Indigenous women in particular are seeing change due to the government’s recognition of indigenous peoples and its intent to “adopt policies for the purpose of maintaining and developing their ethnic and cultural identities, cosmovision, values, and spirituality” (CISPES 2014). It is hoped this will also protect their communal lands, where approximately 60 percent live, and promote their rights to political and economic self-determination (Purdy 2014).

The deadly violence against women, children, and the LGBT community that plagues the country is a gross violation of human rights that the government seems ill-equipped and, at times, reluctant to address. Moreover, the ingrained biases that lead to discrimination and unequal treatment must be fully addressed by the Salvadoran government. Such efforts are necessary if women are to achieve parity with men in the workforce, political participation, and society in general. To remedy these issues, the government must not only pass laws but also be willing to ensure the rights of its citizens are not violated. Likewise, the culture needs to shift toward greater equity and inclusion for all. In doing so, El Salvador will become a safer, more prosperous place for all its citizens.

F

French Caribbean

Overview of Country

The French Caribbean, French West Indies, and French Antilles refer to the seven islands under French sovereignty located in the Caribbean Sea. The islands sit to the southeast of Puerto Rico and the northeast of Venezuela and stretch across approximately 2,000 square miles (2,877 sq. km). Each island has a unique culture, but there are several shared unifying experiences. The islands are susceptible to a variety of natural disasters, such as volcanic eruptions, hurricanes, earthquakes, and tsunamis necessitating the frequent rebuilding of communities (University of the West Indies 2005, 66, 80). Most goods must be imported due to the limited arable land, climate, and isolation. But the island's connection to France has been even more influential than geography. For better or for worse, the influence of the French government has created strong cultural, linguistic, and legal links among the islands.

Before the French, the original inhabitants of the islands were the Arawak people, followed by the Carib people (Ferguson 1997, 12). The second voyage of Christopher Columbus in 1493 marked the first contact between Europeans and what is now the French Caribbean (Pérotin-Dumon 1999, 633). By the 17th century, France had colonized and institutionalized slavery in the region (Moitt 2001, 2). France brought enslaved Africans to the French Caribbean

to primarily work on agricultural plantations. During the period of colonial slavery, the majority of the men of European descent cohabitated, married, and had children with women of African and indigenous descent (Faraclas 2012, 56). The coexistence of indigenous, African, and European people and cultures created what is called *creolization*. Creole is a term that can refer to both a person's ethnic identity and a language (Murdoch 2001, 190). In the French Caribbean today, the largest ethnic group is considered Creole, a mix of African and European descent (CIA 2016). Although the official spoken language is French, each island speaks its own French-based Creole, which is mutually understandable as well as to the French spoken in metropolitan or mainland France (Winford 2009, 19).

France's domination did not end after the nation abolished slavery in 1848. France continued to colonize the islands until 1946, at which point it made Guadeloupe and Martinique overseas departments, or DOMs, of France, and in 1973 and 1974, respectively, they were made regions of France. In 2007, the islands of Saint Martin and Saint Barthélemy separated from Guadeloupe and became overseas collectivities, or COMs, of France (PAHO 2012, 322). Legally, the French Caribbean islands are equal to metropolitan France and are a part of the European Union. Being a part of France has benefits, such as having access to governmental assistance programs. The connection to France also has some disadvantages. Many believe that aligning politically and economically with France, a nation that has

historically oppressed the people of the French Caribbean, continues the oppression they have faced for centuries (Banoum 2011).

Guadeloupe (657 sq. mi. or 1,703 sq. km.) is an archipelago, or chain of islands, with a population of 404,635 (INSEE 2014). A small marine channel separates the two primary islands Basse-Terre and Grande-Terre. La Désirade, Marie-Galante, Petite-Terre, and Les Îles des Saintes, or Les Saintes, are all considered dependencies of Guadeloupe (University of the West Indies 2005, 65). Since the colonial era, women in both Guadeloupe and Martinique have worn a *douillette* or *madras et foulard*, which consists of a petticoat, triangular scarf, and an elaborate headpiece made of madras, a sturdy and patterned material originally from India (Zamor 2014, 155, 157). The *douillette* is used to communicate information about the wearer, such as her marital status and political standing. Although Guadeloupian women today reserve the *douillette* for special holidays and ceremonies, it is considered the symbol of French Creole identity (159).

Martinique (424 sq. mi. or 1100 sq. km.) is an island with a population of 392,291 (INSEE 2014). The people of Martinique have a history of resisting oppressive forces. The 18th and 19th centuries saw several slave uprisings. After becoming a department of France in 1946, Martinique was the most active of the French Caribbean islands in the separatist movement, nearly succeeding in becoming an autonomous nation. The separatist movement was largely influenced by the Negritude movement initiated by black intellectuals studying in Paris that emphasized the connection between black people worldwide and promoted black self-consciousness and self-determination (Banoum 2011).

Saint Barthélemy (8 sq. mi. or 21 sq. km.) stands out from the other islands in many ways. Unlike the others, the majority of its 9,035 inhabitants are of European descent, rather than black or Creole (INSEE 2014). The rocky terrain was ill-suited for establishing plantations, so the population of slaves never came close to the slave populations on other French Caribbean islands. Also known as Saint Barths, the small island is known for being frequented by the richest and most famous tourists from around the world. The cost of living is high on all of the islands due to the need to import most goods, but it is extremely high in Saint Barthélemy (CIA 2016, 488).

Saint Martin (20 sq. mi. or 53 sq. km.), with a population of 36,286, is unique in that it is the only French Caribbean island that is not entirely owned by France (INSEE

2014). Roughly 57 percent of the northern portion of the island is owned by France, and the southern 43 percent is owned by the Netherlands (CIA 2016). The border is not secured in any way; the only mark of the change in governance is an obelisk with “welcome” written in French and Dutch (Permenter and Bigley 2001, 61).

Overview of Women’s Lives

Women’s roles continue to be marked by self-determination, whether by setting their own course in the French Caribbean or by migrating to France for educational and employment opportunities. Although full equality has not been achieved, activists for women’s rights are highlighting issues such as gender-based violence. Due to their status as a territory of France, the islands are not included in the majority of UN country comparisons and rankings, such as the Human Development Index (HDI) and Gender Inequality Index (GII).

Girls and Teens

In the French Caribbean, mothers are traditionally the primary caregivers of children, regardless of the family unit’s structure. While all children are expected to be quiet, polite, modest, and respectful of adults, girls are more constrained than boys. Failure to show an adult the appropriate gestures of respect signifies that the child is challenging the authority of the adult, and the child’s mother is blamed for having raised the child poorly. Discretion in behavior is met with disciplinary actions that sometimes include corporal punishment (Tessonneau 2005, 260–263).

Education

Since the late 19th century, providing universal education has been a priority of France as a means of assimilating the colonies into French society (McDermott and Moon 2012, 16). As in metropolitan France, education is funded by the government and compulsory for all citizens from age 6 to 16, with the option of beginning nursery school, *école maternelle*, at age 2 or 3. From ages 6–11, children attend primary school, *école primaire*, followed by middle school, *college*, which lasts for four years. From there, students are given three choices. They must decide between vocational high school, *lycée professionnel*, which leads directly to a career; a technical school, *lycée technologique*, which is followed by a short amount of studies; or general high

school, *lycée général*, which is often followed by higher education.

The school system is governed under the same rules as France. Public school teachers instruct the children in the official language, French, which has helped the literacy rate come close to 100 percent in the French Caribbean (UNESCO 2013). Until very recently, local Creole languages were expressly forbidden to be spoken or taught in the classroom, but there has been a recent growth in acceptance and appreciation of Creole (McDermott and Moon 2012, 260).

Health

Overall, the health of the French Caribbean people is considered satisfactory. As of 2008, Martinique women's life expectancy was 83.8 years, and Guadeloupe women's was very similar at 83.4; men's life expectancy was a few years shorter at 77.6 and 75.6, respectively (PAHO 2012, 323).

Access to Health Care

In 2010, Regional Health Agencies were created along with a local public health policy (PAHO 2012, 338). The agencies are responsible for health promotion, the organization of health care, and the provision of medical-social care (such as nursing homes), among other activities. In 2010, Guadeloupe had 145 general physicians, and Martinique had 145 general physicians per 100,000 people. They had 122 and 127 specialists, respectively. Nurses, midwives, dentists, and other health professionals complement them. Although a medical school opened in 1998 on Guadeloupe, students must attend university in France to complete some of their medical studies. The number of available hospital beds is comparable to France. Care is available from both public and private hospitals (PAHO 2012, 337).

Maternal Health

Guadeloupe and Martinique have birth rates of 14.3 and 13.3 per 1,000 women and 7.5 and 8.8 infant deaths per 1,000 live births. At 47 births per 1,000 women, this represents a declining birth rate. Most concerning is the presence of persistent organochlorine pesticides, specifically chlordecone (PAHO 2012, 326, 425). Because the agricultural industries use it on banana plantations, its cancer and other health-damaging effects represent complex historical and social issues that leave islanders with little recourse (Agard-Jones 2015).

Diseases and Disorders

Noncommunicable diseases such as cardiovascular disease, certain cancers, obesity, diabetes, alcoholism, and death by violence are prevalent. Obesity in particular is a concern, as one out of two adults and one out of four children were obese or overweight in 2007–2008. The increase in availability of food from the food production sector is cited as a cause (PAHO 2012, 334).

Employment

The French Caribbean's economic status is greatly influenced by its legal and cultural ties to France; islanders experience a higher average standard of living than the surrounding islands, but it is lower in comparison to metropolitan France. The rate of unemployment in the French Caribbean is highest among women and people 25 years old and younger (Mekkaoui 2012). In 2009, the employment rate for women was only 49.3 percent. Poverty is experienced by a little under 20 percent of households and 25 percent of children, most of whom live in a one-parent household (PAHO 2012, 325).

Employment for women in the French Caribbean is heavily concentrated in the service industry. Within the industry, they are most heavily concentrated in the lowest-paid jobs (Dagenais 1993, 86). Much of the service industry is closely related to tourism, the Caribbean's largest industry. Some argue that tourism empowers women by providing income and leadership opportunities (UN Women 2011). Others argue that the nature of the tourism industry is not beneficial to women. Women are well represented within the industry, but they are rarely in positions of ownership or high-level management (90). A large part of the industry includes North Americans and Europeans who come to the islands to pay for sex, primarily with local French Caribbean women. Women involved in sex tourism often carry the heaviest financial burden for their families, and yet their contributions often go unappreciated (Mullings 1999, 71).

French Caribbean women have a unique attitude toward informal employment. As land and wealth has historically been isolated to a small elite group, the majority have learned to rely on multiple sources of income just to survive, and they continue to do so today (Browne 2002, 384). The French term *débrouillard* is defined as a "resourceful or cunning person." An added meaning to the term is given to describe someone who is willing to break societal or legal conventions to pursue profit. A *débrouillard* in the French Caribbean sense has at least some form of income that is

either untaxed or illegal. *Débrouillards* are seen more as entrepreneurs rather than criminals. It is a pervasive economic reality, as one study found, that only the very rich and culturally French have incomes that are solely derived from legal avenues (383). Along with entrepreneurship, French Caribbean women participate in unpaid domestic work for family and friends (Dagenais 1993, 95). The high amount of undocumented income skews data about women's economic contributions and falsely declares many as inactive, even though they contribute many hours to their families and societies.

Family Life

The most common family unit is the extended matrifocal family in which the mother shares the responsibilities of raising the children and the taking care of household with many generations of women (Brunod and Cook-Darzens 2002, 560). The father often has multiple children by multiple partners and divides his time among each, referred to as "visiting unions" (Lefaucheur and Brown 2011, 9). The strength and resourcefulness of this type of family is often undercut by Western perceptions of a successful family. The Western nuclear family model assumes that there are certain functions that only a male father figure can provide. With many women working together to play multiple roles for the child, the French Caribbean family is able to avoid reliance on men for any aspect of childrearing. Western studies and censuses label these families "single-parent households," which overlooks the important contributions of women within the extended families (Brunod and Cook-Darzens 2002, 560). The nuclear family is also present and most prevalent among middle- to upper-class urban families (561). Many incorporate aspects of both or lean toward one or the other, as circumstances necessitate (565).

French laws protect same-sex relationships, but French Caribbean culture does not. Since 1999, civil unions, or PACS, have been available for same-sex couples, and in 2013, same-sex couples could legally marry and jointly adopt children (Loi no. 99-944, Loi no. 2013-404). French antidiscrimination laws do little to deter hostility in the French Caribbean (Loi no. 2004-1486). Very few nongovernmental organizations (NGOs) and activist groups focus on gay rights, and those that do primarily focus on gay men (Cronard 2012). The few safe spaces are created for tourists rather than the local population.

Contraception and abortions up to 12 weeks are legal and partially or fully covered by medical insurance and

social security; many girls and women face barriers to accessing either (Loi no. 75-17). Many lack the education or the avenues to obtain contraception and use it effectively and thus become pregnant. Illegal abortions with the drug misoprostol are common among immigrants who have emigrated from elsewhere (Manouana et al. 2013).

Working women who choose to become a mother receive 16 weeks of fully paid maternity leave. It is the longest and highest paid maternity leave in the region (ILO 2012, 98). The law supports French Caribbean women far greater than the surrounding Caribbean islands, but due to the informal nature of much of the work women do, maternity leave is often inaccessible to them.

Politics

Historically, people from metropolitan France and the white minority, locally termed *békés*, have held the most power in the French Caribbean. From the colonization of the islands in the 17th century, the laws that govern the region have been made by officials, many of whom have never set foot in the French Caribbean. The *békés* of today are the small number of white descendants of former slave-owning plantation owners (Constant 1998, 169). Until the abolition of slavery in 1848, the lawmakers in France made it legal for women to be forced into hard labor, raped, beaten, tortured, and murdered by white slave owners (Moitt 2001, 99).

Today, there is universal suffrage, and the French Caribbean is represented in both the National Assembly and the Senate (Les Outre-Mer 2014). Nevertheless, the majority of the laws are not created with the needs of the region in mind. Locally, political and economic power continues to be in the hands of the *békés* (Constant 1998, 174). In Martinique, *békés* constitute less than 1 percent of the population, but they own 52 percent of the agricultural land and 20 percent of the gross domestic product (GDP) (Bolzinger 2009). In 2009, a 44-day general strike in Guadeloupe and Martinique began over the disparity between the high cost of living relative to the minimum wage. Racial tensions also played a part after the release of the documentary, *Les Derniers Maîtres de la Martinique* (The Last Masters of Martinique), about the *béké* population (BBC 2009; Bolzinger 2009). The strike ended after the government gave in to 20 of the top demands of the strikers, but tensions and unrest remain (BBC 2009).

Before 1848, the enslaved women in the French Caribbean resisted their oppression in a multitude of resourceful

ways. Midwives and nursemaids were able to control reproduction (Moitt 2001, 125). Many women who had access to the kitchen poisoned animals and other slaves to weaken the plantation (106). In many armed revolts staged over the years, women sent messages, transported goods, and aided the sick and injured; a few even participated in combat (174). Many women chose to take great risks to secure freedom for themselves and their families. Some ran away and hid with Maroon bands (136). Most women who became free were women of mixed African and European descent who married white men in a Catholic church, thus ensuring their freedom and their children's freedom (Moitt 2005, 248). Through *rachat*, which translates to "redemption," several women were able to purchase their freedom and the freedom of their relatives (247). When their slave owners contested their right to *rachat*, many women used the oppressive French legal system to their advantage by trying their cases in court (254). Surprisingly, white woman slave owners most frequently opposed enslaved women paying for *rachat* (252). After 1848, the institution of slavery disappeared, but the patterns of oppression and racism continued.

It was not until the 1920s that the French Caribbean saw a major shift in political ideology. Negritude, the political, cultural, and literary movement, opposed colonialism and promoted the autonomy and unity of black people worldwide. Historically, credit has gone to the three fathers, *les trois pères*, for developing the movement while studying in Paris in the 1930s. Guianan Léon-Gontran Damas, Senegalese Léopold Sédar Senghor, and Martinican Aimé Césaire all later held official positions within French government (Banoum 2011). The Martinican sisters Paulette and Jane Nardal are often not given full credit for their influence on the movement. As early as the 1920s, they were contributing scholarly works, held a literary salon where ideas were shared, and introduced French students to participants in the American cultural movement known as the Harlem Renaissance (Lewis 2006, 60). The ideas from the movement greatly influenced political decisions made in the French Caribbean as well as cultural attitudes toward identity.

The 1940s were pivotal years for women in the French Caribbean. With the end of World War II, many changes came for France. The colonies of the French Caribbean became departments and collectivities, and women secured the right to vote (Colón and Reddock 2004, 477). In 1945 two prominent women's organizations were created in Martinique. Paulette Nardal established a right-leaning Catholic *Rassemblement féminin* (Women's Gathering), which focused on women's participation in government,

preserving peace, and making connections with other feminist groups internationally (Lewis 2006, 64, 67). Jane Léro (1916–1961) established the *Union de la Femmes de la Martinique* (Union of Women of Martinique), or UFM. The organization began as a Communist women's collective that focused on using women's votes to create a strong Communist Party and promoting activism for women workers and mothers. The UFM is still fighting for women's rights today, with a focus on providing a support network for women experiencing violence and creating awareness of women's issues (Pago 2000).

Religious and Cultural Roles

From 1685 to 1848, the islanders followed the *Code Noir*, an extensive set of laws concerning slavery in the French colonies. The laws forced all slaves to be baptized as Roman Catholics and punished them for practicing any other faith in public (Lenik 2012, 58). The years of obligatory religious affiliation continues to influence the islands. Today, around 95 percent of the population identifies as Catholic (CIA 2001, 622).

Catholicism explicitly restricts women from attaining many positions within the church, such as priests and bishops (Olson 2012, 25). Culturally, however, the church provides women with a platform to create societal change. Paulette Nardal used Catholicism to give a more conservative image to her feminist organization in the 1940s (Lewis 2006, 64). The religion also provides a structure to many public festivities in which women play a key role.

A small population of Indian descendants practices Hinduism. After the abolition of slavery in 1848, France looked elsewhere for labor by bringing approximately 65,000 indentured workers from India, most of whom arrived in Guadeloupe (Ramdin 2000, 264). Today, there are a few that practice only Hinduism, but aspects of the religion have been incorporated into other faiths. The Hindu goddess *Maliémen* or *Mariamam* has been altered and is worshipped by believers of the syncretic faith, *Quimbois* (a form of voodoo or *Kenbwa*), which was borne in the region (Fernández Olmos 2011, 181).

Quimbois is not an organized religion, but a set of beliefs and practices based on several African religions, Catholicism, and even Hinduism (Fernández Olmos 2011, 179). Male and female supernatural spirits are believed to intervene with living people. Practitioners assist those who need protection from spirits or bring them luck (181). Many of the female spirits fit archetypes of women

characters, such as the *bête à man Ibé*, a shrieking sorceress with one hoof, and the *djablesse*, a beautiful woman who lures men into danger (180).

Carnival is a major cultural event in the French Caribbean. Carnival originated in Europe as a time of festivities preceding Lent, a 40-day period of fasting and repentance in the Roman Catholic Church and several other Christian denominations. The European tradition used masquerades during parades for anonymity when indulging in behavior that would not be allowed during Lent (32). In the French Caribbean, Carnival took on a different meaning and became distinctly Creole. Europeans wore masks to hide their identity, but islanders use elaborate masks to establish their Creole identity (Murdoch 2001, 220).

Women play a major part in the festivities. The clothing items worn by women tell a story of their culture and their individual identity. Towns, organizations, and social groups elect Carnival queens, mini-queens, and queen mothers to represent them in parades. Girls as young as 5 years old can compete to become a mini-queen. In 2013, French senator Chantal Jouanno added an amendment to a gender-equality bill that prohibits children under the age of 16 from participating in beauty pageants. She argued that such pageants promote the hypersexualization of young girls and teaches them that their most important quality is physical beauty (Rubin and de la Baume 2013). The *Union du Carnaval de Martinique* argues that mini-queens, along with queens and queen mothers, are part of their cultural heritage. Senator Maurice Antiste is pushing for the French Caribbean carnival mini-queens to be named an exception to the amendment (Everard 2013).

Carnival is also a space where gender and sexuality can be expressed by participants. Since at least the 19th century, cross-dressing has been a part of the festivities. In most instances, men cross-dress as women, with the most common costume being a bride. Many argue that these instances are not empowering acts that embrace femininity, but rather that they bolster negative beliefs held about women and men who choose to dress like women on a daily basis. It was not until the 21st century that cross-dressing as a form of self-expression could be seen in the Carnival activities. The group KISS, which includes members who identify as part of the LGBT community, promotes a philosophy of acceptance and blows kisses to the crowd. In KISS, cross-dressing is used as a form of expressing one's own identity rather than playing a prescribed role (Flaugh 2013, 51).

The annual *Fête des Cuisinières* (Cook's Festival) held in August began in 1916 by a guild of women cooks, *Le*

Cuistot Mutuel. A few hundred women cooks, both professional and amateur, begin cooking local creole specialties early in the morning before holding a mass for the patron saint of cooks, Saint Lawrence. The group then parades through the streets and end up at a school to share their food with the community (Houston 2005, 140). Many songs and dances accompany the meal. As during Carnival, women don highly ornate dresses steeped in symbolism and tradition (Gianturco 2004, 94).

Issues

Domestic Violence

A major issue facing French Caribbean women is domestic violence. While it is common, many girls and women do not seek legal rectification and continue to live in unsafe environments. Women and girls are often unaware of their legal rights regarding domestic violence or organizations that provide assistance (Lafaucheur et al. 2012, 209). Many women fear that if they leave the relationship with their abuser, he will retaliate. In 2004, Sandra Cadet-Petit was burned to death in a Guadeloupe city center by her former partner after having filed several complaints against him (*L'Express* 2008). While the UFM made her a symbol of the growing problem of domestic violence, many women in volatile relationships saw it as something that could happen to them if they tried to leave their partners (Lafaucheur 2012, 10).

Religion greatly influences how women respond to violence. Women living in violent situations often look to Quimbois for a way to support each other and protect themselves. Quimbois gives a voice to the fear of violence that they face and have faced as women. Female spiritual authorities remember and frequently recite the stories of victims to younger generations (Klungel 2010, 43). One of the demons of the Quimbois faith is called a *dorlis* or *homme-au-baton* that rapes women while they sleep. With both living and dead perpetrators, women guard themselves with material protections, such as certain colored underwear and rosaries (51–52). Where the threat of sexual violence is an everyday concern, women can share their stories and feel protected.

Out-Migration

Migration is another major issue for the French Caribbean. Migration between the French Caribbean and metropolitan France has increased rapidly since the 20th century. While some French Caribbean women have taken advantage of educational and economic opportunities unavailable on

the islands, many suffer from disintegration of valuable familial ties and are pushed toward lower-paying employment sectors. Overall, metropolitan France seems to benefit more from the migration than the people of the French Caribbean.

Most of the islanders that lived in metropolitan France before World War II were educated professionals, such as the founders of Negritude (Germain 2008, 15). The close of the war brought economic prosperity to metropolitan France. In response to the labor shortage, the French government created BUMIDOM, *Bureau pour le développement des migrations dans les départements d'outre-mer*, in 1963, which also provided assistance to immigrants in establishing housing (Milia-Marie-Luce 2009, 5, 104–105). French Caribbean women were largely hired as domestic workers and nurses. Many women were trained at a professional school specifically to learn the customs of metropolitan domestic life (Condon 2004, 135).

As more and more people moved to metropolitan France, the rural agricultural industry in the French Caribbean plummeted. The population became concentrated near the capitals, which had few employment opportunities. At this point, much of the population became heavily reliant on welfare programs (Berrian 2000, 109). After metropolitan France's economic success began to turn, its attitude toward the presence of overseas citizens changed. Unemployment rose, and the government essentially reversed BUMIDOM with ANT, *Agence Nationale pour l'Insertion et la Promotion des Travailleurs de l'Outre-Mer*, in 1981. ANT attempted to reverse the flow of migration and rebuild the French Caribbean region (3).

Migration to France has not been detrimental to all women. Several women have been able to share their talent and hard work with the world after receiving an education in metropolitan France. Martinican filmmaker Euzhan Palcy became the first black woman director to have a film produced by a major Hollywood studio (MoMa 2011). Guadeloupean writers Maryse Condé, Myriam Warner-Vieyra, and Simone Swartz-Bart and their works are known internationally. Although none of the women returned to the French Caribbean after completing their education, each continues to focus on the deep-seated issues of race and gender alive in the region.

French Guiana

Overview of Country

French Guiana (Guyane or *La Guyane française*) is located on the northeast shore of South America. It is nestled between Brazil on its eastern and southern borders, Suriname to the west, and the Atlantic Ocean to the north. The region spans a land area of 32,253 square miles (83,534 sq. km). The Amazon rain forest covers 94 percent of French Guiana. Its approximate length is 186 miles (300 km), and its width is 207 miles (333 km). The capital city is Cayenne.

French Guiana's population in 2015 was 276,000 individuals of varying ethnic backgrounds: black or mulatto (66%); white (12%); East Indian, Chinese, or Amerindian (12%); and other (10%) (UN Statistics Division 2016). The population growth rate from 2010 to 2015 was 2.8 percent, with an urban population concentration of 84.4 percent (UN Statistics Division 2016). French is the official language of the region. French Guianese Creole—a mixture of ethnic languages—is also commonly spoken. Roman Catholicism is the primary religion.

Of the rich ethnic diversity in French Guiana, most residents are of African, indigenous, Afro-European, or Asian descent. Originally inhabited by various indigenous groups, including the Caribs, Arawak, Wayampi, and the Wayana, French colonialism introduced enslaved Africans in the 17th century along with Asian laborers and then Hmong refugees in the mid-20th century. Undocumented Maroons, or "Bush Negroes," also populate French Guiana. Maroon communities, descendants of escaped slaves, have maintained their West African traditions and origins. Many live along waterways and maintain contact with other Maroon communities in the neighboring country of Suriname (Minority Rights 2016). According to the UN *World Urbanization Prospects* report, in 2014, 84 percent of the country's population lived in urban areas such as Cayenne and Kourou. With an annual urban growth rate of 0.4, the projected urban population is expected to reach 89 percent by 2050 (United Nations 2014).

French Guiana is one of the French Republic's five overseas departmental regions: French Guiana, Guadeloupe, Martinique, Mayotte, and Reunion. As a territory, French Guiana is under the political rule of France. The French government functions as a semipresidential republic. Powers are divided among three branches: executive, legislative, and judicial. French Guiana has representation in the house and in the French National Assembly. Two representatives from the region are part of the National Assembly, and two are in the Senate (Minority Rights 2016). Legislative representation of French Guiana within France's bicameral parliamentary system is included in the 328/348 seats for metropolitan France and the five overseas departments (CIA 2016). A prefect is appointed by the president of France to head French Guiana's local government.

In 2009, the per capita gross domestic product (GDP) of French Guiana was USD\$17,812 (PAHO 2012). The region's GDP is lower than any other French region. The European Space Agency (ESA) located in Kourou accounts for one-fourth of the region's GDP (BBC 2016). As part of the European Union, the currency in French Guiana is the euro. The economy is largely dependent on food and energy imports as well as subsidies from France. Exportable agricultural products include corn, rice, manioc (tapioca), sugar, cocoa, vegetables, and bananas. The timber, fishing, forestry, and gold mining industries also contribute to the economy's exports (CIA 2016; BBC 2015).

As an overseas department, data on the region of French Guiana is generally integrated with data on the

French Republic. Individual data is not reported or made readily available.

Historical Background

French Guiana is one of three regions (Guyana, Suriname, and French Guiana) that make up the Guianas in north-eastern South America. Prior to European arrival, indigenous populations that included the Wayampi, Arawak, and Carib inhabited the Guianas. Exploration during the Columbian era led to successive occupation by the Dutch, Spanish, and French, which displaced the indigenous populations. In 1594, the lush coastal land of the Guianas was mistaken to be El Dorado, the mythical Land of Gold, and claimed by Walter Raleigh (1591–1618), who had led the search for gold (Raleigh 2009).

Originally controlled by the Dutch, French settlement of the region began in the early 17th century. In its first attempts to colonize the region, the French brought Africans as slave labor, beginning in 1654. As a plantation economy, the population of slaves greatly outnumbered white settlers. In 1819, population reports account 13,309 slaves, 1,698 free persons of color, and 987 white settlers (Curtis 2010). Unlike other European colonies in the Americas, manumission from slavery was common. The outnumbering of enslaved women over enslaved males did not allow for traditional European divisions of labor. The agricultural economy provided a need for African laborers. Men tended to occupy the roles of hunting and carpentry, while women primarily worked as field hands (Moitt 2001). Sugar plantations were created around the Dutch colony of Cayenne, which later became the capital city of Cayenne when the territory was granted to France under the Treaty of Breda in 1667.

In their search for gold, European settlers met harsh environmental conditions, hostile natives, and tropical diseases. By 1763, living conditions in the region had claimed the lives of over 12,000 settlers (Aldrich 2006). The high death toll of settlers led Charles Louis-Napoléon Bonaparte (1808–1873), the first president of France, to deem the land inhospitable. In 1852, Bonaparte made French Guiana a penal colony. Adjacent islands and settlements across the region became known as Devil's Island, “the colony of the damned.” As part of a system of penitentiaries, camps were established in major cities such as Cayenne and St. Laurent as well as in “jungle camps” in the middle of rainforests.

More than 80,000 prisoners from France were sent to the region from 1852 to 1947. Convicts included political

prisoners and serious offenders, such as thieves and murderers. Women condemned of infanticide in France were also sent to Devil's Island between 1852 to 1903, in an effort to populate the colony. Nearly 75 percent of all prisoners died from disease, hunger, or mistreatment by prison guards. Fewer than 10 percent survived their sentences (Marshall 2005). Cayenne became a passage point for escaped slaves, who later formed Maroon communities, up until the abolition of slavery in 1848. Being landlocked by water and other natural elements, many escaped prisoners also found refuge in Maroon communities (Minority Watch 2016). French Guiana continued as a penal colony until after World War II; all Devil's Island penitentiary camps were officially closed by 1945.

Choosing departmentalization over independence, French Guiana became an official overseas department of France (*département d'outre mer*) in 1946. Subsequent internal and external tensions in the Guianas threatened the economic and political stability in the region. However, French Guiana has remained an official overseas department.

In the 1980s, indigenous and Maroon groups from the neighboring country of Suriname sought refuge in French Guiana after violence between local rebel groups and the government displaced thousands of Surinamese. By 1992, of the estimated 10,000 refugees who had relocated to French Guiana from 1986 to 1988, a repatriation plan between France and Suriname was accepted by approximately 6,000 registered refugees to return to Suriname (Minority Rights 2016).

Overview of Women's Lives

The history of slavery and colonialism in French Guiana has had long-lasting effects on the region, especially for those of African and indigenous Amerindian lineage. Colonialism, migration, and racialization has impacted the lives of women and children disproportionately. Political representation and participation for women has improved but remains limited. While levels of poverty are not as extreme as in neighboring countries, hardship is overwhelmingly felt by those in rural and interior areas of the region. Such poverty-related challenges affect health outcomes for women. Environmental conditions of the tropical region have major implications for pregnancy and fetal development. Social and cultural factors also reproduce health endemics that interfere with the well-being of women and children in the region.

Girls and Teens

Teen Pregnancy

Modernization in French Guiana has contributed to a declining rate of teenage pregnancies. The rate of teenage pregnancies is, however, still frequent and higher than in mainland France. In 2012, the proportion of teenage pregnancies decreased significantly to 6.1 percent from 7.2 percent in 2009 (Akoï et al. 2016). Sociodemographic factors such as peer pressure, absence of sexual educational resources, and lack of access to contraceptives in remote areas contribute to the early sexual activity of the youth.

Education

The abolition of slavery in 1848 was met with the establishment of the educational system in urban areas across the region of French Guiana in cities such as Cayenne, Kourou, Rémire, Montsinéry, and Roura. Enrollment increased from 1,200 students in 1852 to over 2,500 students by the early 1900s (Puren 2007).

When the French colony became a regional department in 1946, aggressive public policies established religious boarding schools that forcibly removed Amerindian and Maroon school-aged children from their respective communities and relocated them to schools in remote areas (Migge and Légise 2010). School attendance for indigenous Amerindian and Maroon populations did not officially become compulsory until the 1960s.

The current education system in French Guiana is modeled after the system in France and is compulsory until the age of 16. Primary school is available across the region and lasts for five years. Most students complete primary school, except for in remote rural areas where access is limited. Many students only complete primary and middle education. Secondary and tertiary schools are primarily located in larger towns and urban areas. Middle and secondary education comprise secondary education and lasts for seven years.

Access to vocational and tertiary (university-level) education is limited in the region. Most who seek professional and university degrees attend schools overseas, as they benefit from European community status. Women in French Guiana have higher rates of educational success than their male counterparts. In 2010, only 7.8 percent of the total population held a university diploma. The literacy rate is 83 percent (Marino 2016).

Efforts have been made to integrate linguistic training of local dialects into the public curriculum to accommodate

the rich ethnic and linguistic diversity in the region (Migge and Légise 2010).

Health

Health Care Access and Overview

France's social service and security system provides universal health coverage to those living in French Guiana. Access to health care across the region is limited. Health care facilities and hospitals tend to be located in cities, creating an obstacle to individuals living in remote areas. French social security programs provide financial assistance for work injury, maternity leave, unemployment and disability. Preventive services such as immunizations are provided at no cost by the French General Council.

Maternal Health

Environmental contaminants can have dangerous effects during pregnancy and thereafter. For those living in rural areas and in the tropical rain forest, water contamination and infectious diseases are of high concern. Despite close proximity to water supplies, populations living in remote areas lack access to safe drinking water (PAHO 2012). Gold extraction is one cause of contamination of the water and food supply. Through gold extraction, particulates of methylmercury contaminate lakes and rivers. Local populations thereby become exposed to the toxic substance through water and fish consumption. Constant exposure to the carcinogenic substance can have long-lasting effects on human health, especially on fetal development. Overexposure to methylmercury causes neurological deficiencies in children (Cordier et al. 2002; Cordier et al. 1998; Fréry et al. 2001).

Diseases and Disorders

French Guiana has more preventable health occurrences than neighboring regions, such as infant and maternal mortality and communicable diseases such as malaria, yellow fever, dengue fever, and HIV/AIDS. The tropical terrain across the region creates an ideal environment for mosquito-borne diseases to thrive. Malaria, yellow fever, and dengue fever are endemics in French Guiana that threaten the lives and well-being of pregnant women and their developing fetuses. In 2009, approximately 3,345 cases of malaria were recorded (Marino 2016). Outbreaks of dengue fever also serve as an issue of high concern for pregnant and nursing mothers. Studies have found dengue

fever to be a leading cause of fetal death (Carles et al. 1999). Similar debilitating effects on fetal development occur with the spread of the Zika virus in the region.

The HIV/AIDS endemic is of increasingly high concern in French Guiana. According to a 2006 study, rates of HIV infection were the highest in mainland France as well as its overseas departments (Marino 2016). As of 2010, the rate of HIV diagnoses was 1,124 cases per million. The rate of AIDS diagnosis was 180 per million. Contributing factors include cultural polygyny, transactional sex (45%), and intravenous drug use of crack cocaine (16.8%) (Nacher et al. 2010). Women in French Guiana tend to be impacted by HIV/AIDs (48%) at rates higher than any other overseas region of France. They are followed by men, due to nondisclosure from mates, and those who contract it when purchasing sex. HIV-positive women in the region are younger (34 years) than HIV-positive men (41 years). Their diagnoses are found later toward progression to AIDS than men's (Nacher et al. 2010). Of both sexual and nonsexual origins, close to one-third of those infected with the virus do not tell anyone of their status due to the negative social stigmas attached to disclosure. More than 10 percent of deaths in the region are the result of HIV/AIDS-related causes (Bouillon et al. 2008).

Employment

Of employed persons between the ages of 15 to 64 years (2014), 14.9 percent are in industry professions; 58.3 percent are in service or other jobs. Women heavily occupy service-related jobs in the region. In 2014, 49 percent of women participated in the labor industry compared to 60.8 percent of men (UN Statistics Division 2016). While the annual rate of natural migration increase has remained stable since 1985, increased life expectancies, fertility rates, and immigration have led to a growing population, which in turn has placed pressures on the job market (UNICEF 2013).

In operation since 1968, the ESA (Centre Spatial Guyanais) has been located in the city of Kourou. As the center of the industrial sector in the region, the center contributes to tourism and accounts for one-fourth of the region's GDP. The center offers employment to approximately 24 percent of the population. In 2011, the ESA employed approximately 1,525 directly and 7,500 indirectly (ESA 2016).

Unemployment

French Guiana's economy has experienced little economic growth in recent decades. Consequently, unemployment

rates have become a serious problem, particularly among women and youth. Between 2010 and 2014, the employment rate rose from 21 percent to 22.7 percent (UN Statistics Division 2016). Unemployment rates in the region are substantially higher than in mainland France (10.3% in 2014). The unemployment rate for women in 2010 was substantially higher than men at 36 percent (Marino 2016).

Poverty

In 2009, French Guiana's per capita GDP was estimated at USD\$17,812 compared to USD\$37,962 in the mainland. The French government grants subsidies and social benefits to those living in French Guiana. Such benefits provide basic financial assistance, access to social benefits, or assist people entering the workforce. The rate of the population receiving such benefits in 2009 was 103 per 1,000 persons aged 20–59 (PAHO 2012; INSEE 2012). The dependency ratio demonstrates overwhelming reliance on social services from the French government by children and the elderly. In 2015, the dependency ratio for the population age 14 and younger and 65 and older per 1,000 was 63 percent (UN Statistics Division 2016). Among the five overseas departments of France, poverty is most prominent in French Guiana. In 2006, approximately 26.5 percent of households fell below the poverty line (INSEE 2006). Single-parent households are more likely to be below the poverty line than two-parent households in both urban and rural areas. Approximately half of all children in the region live below the poverty line. Large family sizes and single-parent households are the leading causes of childhood poverty. Data is unavailable on poverty rates among ethnically marginalized groups in the region.

Migrant Workers and Refugees

Immigration has impacted the ethnic diversity and the economy of French Guiana. Workers from Haiti, Brazil, Asia, and Suriname, along with urban Créoles and educated European migrants, have placed pressures on job opportunities in urban areas. For groups such as Amerindians and Hmong refugees, farming has proven successful. Relocation of Hmong refugees from Laos began in 1977. Resettlement in French Guiana during the Hmong diaspora created ethnically homogenous villages in Cacao, Regina, and Javouhey (Clarkin 2005). Hmong agricultural villages are based on market and subsistence farming.

Job Opportunities

Outside of the capital of Cayenne, job opportunities in the region are extremely limited. Job opportunities in the city are competitive. The formal labor market is dominated by foreigners and men; however, employment opportunities for all women are greater than in the past.

In urban areas, female participation in the labor force has slowly increased from 45.7 percent in 2005, to 48.0 percent in 2010, to 49.0 percent in 2014. Simultaneously, labor force participation for males has decreased slightly from 61.5 percent in 2005, to 61.4 percent in 2010, to 60.8 percent in 2014 (UN Statistics Division 2016). Women are most likely to work as agricultural workers and in the public sector. Cultural norms and family responsibilities contribute to the unemployment rate of women across the region.

Many women from rural Maroon communities experience economic independence from men. As either temporary seasonal or permanent workers, women from transmigration villages spend time in coastal market areas, such as in Paramaribo, Albina, and Moengo. Other Maroon women work in domestic roles, such as cleaning houses in urban areas. Despite these work opportunities, a majority of Maroon women are unemployed (Polimé 1992).

Family Life

The average life expectancy is 73 years for men and 81 years for women (BBC 2016). In 2008, the general mortality rate was 3.4 per 1,000; the infant mortality rate was 11.6 deaths per 1,000 live births; and the maternal mortality rate was 28.2 deaths per 100,000 live births (PAHO 2012).

Reproduction

The growing population of French Guiana can be attributed to the population fertility rates as well as immigration. The population growth rate is 2.8 percent (2010–2015). The overall fertility rate (2008) is 47 births per 1,000 women of childbearing age, with an average birth rate of 3.5 children per woman. The adolescent birth rate is 84 per 1,000 women between the ages of 15–19 years as of 2007 (UN Statistics Division 2016).

Marriage rates have been on a constant decrease as the number of single-mother households continues to increase. In 2014, the rate of marriage per 1,000 inhabitants was 2.3 percent, down from 2.8 in 2008. As fertility rates increased, the percentage of nonmarital births has

also risen: the rate of nonmarital births has increased from 81.9 percent in 1999 to 87.9 percent in 2008 (Pla and Beaumel 2011).

Gender Roles and Family Structure

Close family ties are important to the culture and value system of French Guiana. Along with strong Roman Catholic values, lack of family planning and lack of access to contraceptives have resulted in large families. Family units are, however, following Western trends and becoming smaller.

Maroon societies are matrilineal but rest in patriarchal values. Polygyny (one man may have multiple wives) is common in the region, especially in Maroon societies. Failure of a woman to abide by social norms of male leadership could result in divorce or be grounds for the husband to obtain another wife (Polimé 1992).

Politics

Participation in Government

A prefect and a 51-member assembly administer the local government. The prefect serves as the chief officer for the region and represents the president of France. Political parties differ ideologically from those in the mainland of France and represent local issues. The primary political parties are the Guianese Socialist Party and the Union for a Popular Movement.

In the region, all adults over the age of 18 have the right to vote. Although women comprise half of the electorate, women are not equally represented in government. Christiane Taubira-Delannon (1952–) became the first woman to be elected into French legislature in 1993. Born in Cayenne, Taubira was the founding president of the Guyanese Walari political party. Under the government of President François Hollande, she was later appointed as the minister of justice of France in 2012. Taubira has used her political platform to discuss issues of slavery and political equality in France.

Maroon Political System

Many Maroon communities continue to operate under their traditional political systems. Local administrative roles in Maroon communities include the *gaaman*, the tribal leader; the *kabiten*, the head of the village; and the *asbasias*, assistants to the *kabiten*. Each of these roles have traditionally been held by men, with the exception

of the role of *asbasia*, which can be either male or female. In the late 1990s, cultural norms began to shift and allow women to maintain leadership roles in tribal communities. Women have since been able to reach higher political roles by becoming a *kabiten*. Such communities with a female *kabiten* include the Ndjuka and Paramaka territories (Polimé 1992).

Citizenship and Nationality

Citizens of French Guiana receive full citizenship rights of France and the European Union. While the French Constitution provides citizenship to all inhabitants, the rights of ethnic minorities, such as indigenous Amerindian and Maroon communities, have been politically ambiguous. Although these groups continue to press for political authority and recognition of territorial rights, there is little support for independence.

Illegal immigration also presents problems of citizenship and political issues in the region. Immigrants from neighboring countries and the Caribbean islands commonly migrate to French Guiana to benefit from the French social security and health care system.

Religious and Cultural Roles

Roman Catholicism is the primary religion observed in French Guiana. Indigenous Amerindian and African religions are still practiced in remote Maroon communities. Religious practices impact the health and economic opportunities of women in the region.

Issues

Trafficking and Prostitution

The trafficking of girls and women into the sex trade industry is not a new phenomenon in French Guiana. It can be traced back to colonialism, the removal of indigenous populations, and domination of enslaved persons in the region.

Data on sex trafficking in the region is, unfortunately, extremely limited. According to the 2015 *CIA World Factbook*, any women and children who are forced into the sex trade in the region are from the neighboring countries of Suriname and Brazil. The recent HIV/AIDS endemic has been exacerbated by sex trafficking and prostitution in the region, primarily in border areas.

G

Greenland

Overview of Country

With a 27,000-mile (44,087 km) coastline and a total area of 810,000 square miles (2,166,086 sq. km), Greenland is the world's largest island. The northernmost point is 459 miles (740 km) from the North Pole, and the southernmost part is approximately the same latitude as Oslo, Norway. The Greenland ice sheet covers 85 percent of the island. Greenland is a part of the North American continent and is located between the Arctic and the North Atlantic Oceans (Statistics Greenland 2016a). The Greenlandic settlement structure is characterized by a so-called island settlement structure, as the population lives in 17 towns and more than 60 settlements scattered along the west coast and the southern parts of the east coast. Nuuk, the capital, is the largest, having roughly 17,000 inhabitants. The towns and settlements are not connected by roads; people travel between them by boat, plane, and helicopter. In northern and eastern Greenland, when the sea ice is solid, people travel by dogsled or snowmobile.

The Greenlanders—the Greenlandic Inuit—are an Arctic indigenous people related to the Inuit. They are an indigenous people of northern Alaskan and Arctic Canadian origin and livelihoods and constitute a common language group. The Greenlanders call themselves *Kalaallit*, meaning “Greenlanders,” or “Inuit,” for human beings. At

89 percent, the Greenlandic Inuit constitute the majority of the population. For the remainder, 8 percent are of Danish origin, and 3 percent are from other parts of the world (Statistics Greenland 2016a). Although the official language is Greenlandic, Danish is taught in schools, and mastering Danish or English is necessary to attend further education.

Greenland's total population is 55,847. Roughly 8 out of 10 people are born on the island. As there is no formal Greenlandic citizenship, the category “born in Greenland” has been used as a substitute in the official population statistics. Surveys (e.g., the Greenlandic part of the Survey of Living Conditions in the Arctic, SLiCA) show a high correlation between “born in Greenland” and the individual's self-identification as “Greenlander.” Many citizens (8,800) live in settlements with fewer than 500 people. Since January 2009, four regional municipalities were established from 18 former municipalities. The female share of the population is 47 percent (Statistics Greenland 2016c). There is a male majority because Greenland lacks skilled labor in different trades, and most people moving to Greenland to work are men.

The total population figure has been stable for a decade, with a minor decline in recent years due to net out-migration. Some young Greenlanders out-migrate after leaving to study abroad (primarily in Denmark) and choose not to return after completing their education for reasons such as uncertainty about access to day care or a lack of housing facilities.

Historical Background

In 1721, the Kingdom of Denmark started to colonize Greenland by establishing borders and building small colonies along the west coast to conduct trade and missionary work, with the intention of making the Greenlanders sedentary. Before colonization, no borders or formal citizenship existed among Inuit in the Arctic (Greenland, Canada, Alaska, and Siberia). Patrimonial social relations characterized the social life of small communities. In the 1860s, an administrative system, training of catechists, and a newspaper were started, and in 1908, municipal and provincial councils were introduced. The representatives were elected between and by electable men.

In 1926, Greenlanders became Danish citizens (Grønlands Kommissionens of 1948). During World War II, US military forces established several bases, of which one, the Thule Airbase, is still in operation. A change in the Danish Constitution abolished Greenland's colonial status in 1953, and it became a country formally on equal terms with the other Danish countries. At the same time, Greenland became a part of the Danish Kingdom, this formal decolonization process reduced Greenlanders to a minority in the Kingdom of Denmark. At the time of Greenland's change of status to an "equal" part of the Danish realm, roughly 25,000 people (of which more than 90 percent had been born on the island) lived in Greenland compared to the Danish Kingdom's approximate total population of 4.4 million. The Greenlanders, with a majority in Greenland, amounted to less than 1 percent of the total population in the Danish Kingdom in the beginning of the 1950s (Poppel 2014). Following the amendment of the Danish Constitution in 1953, Greenlanders were granted two seats in the Danish Parliament.

In everyday life, however, the change of status did not mean significant changes in Greenlanders' control of their own country, as Greenland had been administered from Denmark for a long time, and the Danish state continued to govern with the same administrative processes as before. Furthermore, Greenlanders experienced a major influx of Danish workmen and administrative staff to organize and implement the transformation of Greenland into a modern welfare society, as sketched and programmed in the so-called G-50 (Poppel 2005a) and G-60 (Poppel 2005b) plans.

The Home Rule Act (1979) was the first step for Greenlanders to become a majority in a self-governing Greenland. As Greenland remained a part of the Danish Realm,

Greenlanders were still Danish citizens, and matters related to citizenship were still the responsibility of the Danish authorities (Home Rule Act 1978).

In 2009, the Act of Self-Governance in Greenland replaced the 30-year-old Home Rule Act. An important part of the new regime was the Danish State's recognition of Greenlanders as a people according to international law and thus with a right to self-determination. Nonetheless, the self-governance arrangement, according to the act from 2009, meant that Greenland continued to be a part of the Danish Kingdom, and Greenlanders remained Danish citizens (Self-Governance Act 2009).

Greenland society has experienced major changes since World War II, especially in the 1950s and 1960s, which was called the "Danization" period. This was when Greenland changed from a colonial state to a so-called equal state, but in some ways, it was also a response to the Greenlandic political wishes for self-determination between 1945 and 1950 (Sørensen 1983). Rapid demographic, economic, social, cultural, and political changes have taken place that have further influenced Greenlandic norms and value systems.

Some prominent changes have had major impacts on gender relations, such as shifting from a society based on hunting and fishing to one that includes Western industrialization. Almost half of all Greenlanders employed are women; with this, the family structure and household size and composition has changed rapidly (Poppel and Chemnitz Kleist 2009).

The Greenlandic economy has traditionally been, and still to a large degree is, dependent on renewable resource harvest. Fishing and hunting is the most important industry in Greenland's economic development. The other three major industries are tourism, mineral exploitation, and other land-based trades. Roughly 90 percent of the value of Greenland's exports come from fish (primarily halibut, mackerel, and cod) and crustaceans (mainly shrimp) (Statistics Greenland 2016a).

Based on agreements between the Greenlandic and Danish governments, Greenland receives an annual block grant amounting to about USD\$532 million (3.7 billion Danish krone (DKK)) in 2015. The total gross domestic product (GDP) amounts to about USD\$2.4 billion (16.9 billion DKK), and the gross average household income is about USD\$59,000 (412,000 DKK) in 2014 (Statistics Greenland 2016b).

The Greenlandic climate is arctic to subarctic, defined by a July temperature that on average does not exceed 50°F (10°C). However, global warming is affecting Greenland

as well as the rest of the Arctic. There are signs of climate change, such as surface and water temperatures rising more rapidly than in the rest of the world, retreating sea ice and glaciers, a massive loss of the Greenland ice sheet, thawing permafrost, and an increase of unstable and unpredictable weather. All of these affect and will further impact livelihoods and health and living conditions (Larsen and Fondahl 2014). Among the effects, the rapid retreat of the Ilulissat Glacier, one of the most productive glaciers in the world, is visible proof and often used as a showcase for climate change. Hunters in northern Greenland have experienced increasing difficulties hunting and fishing on the sea ice because of less stable and thinner ice.

Greenland is a parliamentary democracy within a constitutional monarchy. It is a self-governing territory but not an independent state. Being a part of the Danish Realm, along with Denmark and the Faroe Islands, means that Greenland does not have its own seat in the United Nations. Because of this, Greenland is not included in the majority of UN country comparisons and rankings, such as the Human Development Index (HDI) and Gender Equality Index (GII).

While Greenlandic women face challenges of sexism and gender disparities, they have seen progress in key areas such as education, which can result in gains in employment and politics.

Girls and Teens

Twenty-five percent of the Greenlandic population, roughly 14,000, is under the age of 18, and 49 percent of the children and young people are women (Statistics Greenland 2016c).

Child Abuse

An annual report from the Greenland police provides information about the sexual abuse of children, but without gendered distribution. Thirty-one sexual assaults of underage children (younger than 15 years old) were reported in 2015; this is less than half of what was reported in 2011 (Grønlands Politi 2015, 7).

A 2014 survey among Greenlandic youth in the 18–25 age range conducted by the Danish National Center for Welfare Research documented that a large proportion of

Chart 1: Sexual assaults against children.

Source: Grønlands Politi 2015, 7

underage Greenlanders (under the age of 15), primarily, but not only, girls, had been sexually assaulted. The survey was based on a random sample of young Greenlanders; 151 out of 400 participated in the survey. The survey categorized the young, sexually assaulted persons into three groups:

- First sexual experience with another person before the age of 15: women 53 percent, men 29 percent (61 persons in all)
- Did not participate by her/his own choice: women 33 percent, men 33 percent (49 persons in all)
- First sexual experience with another person before the age of 15 and did not participate by her/his own choice: women 21 percent, men 4 percent (20 persons in all) (Christensen and Baviskar 2015, 38)

For many years, child neglect and child abuse have been problems that increasingly take center stage in public debates, which resulted in a number of political initiatives based on the UN Convention of the Rights of the Child.

On November 22, 2011, Inatsisartut, the Greenland Parliament, adopted a legal act to set up a National Advocacy Center for Children's Rights (MIO), a spokesperson for the children of Greenland (the head of MIO), and a children's council. The spokesperson as well as the council are appointed by the Greenlandic government, but the spokesperson, the council, and the advocacy center are politically independent and have freedom of expression (Chemnitz 2012). Subsequently, Greenland's first children's rights institution, MIO, was established in 2012 and is headed by an official children's spokesperson.

Another initiative is a collaborative agreement, which will remain in force until the end of 2020, between the government of Greenland and UNICEF that actively promotes and focuses on information about children's rights (Naalakkersuisut 2015a).

Whereas child neglect and child abuse represent severe problems for a number of girls and teens, sex trafficking is not a problem in Greenland.

Education

Literacy

Greenlandic children have been subject to compulsory school attendance for more than 100 years, since Danish colonial rule. Illiteracy has been eradicated for generations. When the Home Rule Act was established in 1979,

the administration of public schools and the further education system were among the first fields of responsibility transferred from the Danish to Greenlandic authorities. This signaled the importance and expectations vested in educating Greenlanders as a precondition to make the best of the opportunities of home rule and as a point of departure to further self-determination. This is also the main reason why education has been high on the political agenda since 1979 and why public funding for education has been prioritized, resulting in budgets where roughly 20 percent of the total public expenditures are earmarked for education. Greenlandic education, at all levels, is publicly funded, and admission to primary, secondary, and postsecondary education is free.

The latest school reform, named *Atuarfitsialak*, or the "good school," states that children are subject to compulsory school attendance for nine years. Despite ongoing discussions about the public school system and to which degree it matches the demands in further education, there is a general agreement that illiteracy is not an issue.

Preschool

Sixty-nine percent of all children five years old and younger attended a public or private preschool in 2012. More children in towns (73%) than in settlements (45%) attend preschool activities and institutions. The vision of the Greenlandic government is to increase the total percentage to 89 percent by 2024. An equal share of girls and boys attend preschool (Ministry of Education, Culture, Research and Church 2015).

Primary and Secondary Education

By law, Greenlandic children attend school from grades 1 to 9 (ages 6–15). Furthermore, grade 10, which is offered to all, provides an opportunity to pass a school-leaving examination that is a precondition for attending high school.

In the school year 2014–2015, roughly 7,500 students attended Greenland's 83 public schools; 23 schools are located in the country's 17 towns and 60 in the settlements. Some students living in the sheep-farming district in South Greenland are homeschooled at the farms where they live. There were two private schools in the two largest towns, with 220 matriculated students (Inerisaavik 2015).

A total of 756 students left the public school's grade 10 in 2012 with a school-leaving examination. Of these, 399 were girls, and 357 were boys. Girls constitute a majority of those leaving grade 10 with a school-leaving examination,

A woman in costume performs during Junkanoo, a traditional festival held in the Bahamas. Junkanoo originates from a celebration held by enslaved people during three days off they received around Christmas. The tradition died with the abolition of slavery, but has been revived, and now the carnival is annual. Maureen Duvalier is considered the first woman to dance in the Junkanoo parade and brought other women in to dance. (Jocrebbin/Dreamstime.com)

continuing a trend from previous years, which is partly explained by the fact that more boys than girls participate in remedial education.

The Greenlandic government's educational consultancy service, Inerisaavik, assesses the Greenlandic public schools, their students, and how they perform. Gender-distributed student profiles from 2012 applying a three-grade scale (strong, good, and weak) found that two-thirds of girls and boys fell into the "good" category, and girls constituted the majority of those in the "strong" category (Inerisaavik 2013).

Greenland's youth have eight study programs to choose from in high school. There are four high schools located in the four municipalities. From 2005 to 2012, the number of high school students grew 70 percent, from 791 students to 1,344. The number of students who completed high school increased by 135 percent, from 150 percent to 353 percent. The discrepancy between enrollment and completion figures is due to the number of dropouts. The completion rate of 55.6 percent in 2012 was low (Ministry of Education, Culture, Research and Church 2015, 16).

Postsecondary Education

Since the introduction of the Home Rule Act, many resources have been invested in developing Greenland's education

system. Both vocational education and training and the University of Greenland have been expanded and transformed to meet the needs and demand for well-educated Greenlanders to substitute for the non-Greenlandic speaking staff in public administration, in a variety of institutions and companies, to further participation in developing new trades and industries and to develop the Greenlandic society toward independence.

Basic vocational training and education is provided by seven training and education centers for various industries: construction, iron and metal, commercial studies, food science, social and health sector, graphic arts industry, service sector, and electrical industry.

Ilisimatusarfik, the University of Greenland, located in Nuuk, provides education at the university level. University programs include teacher training, nursing, journalism, social work, economics, and theology at the bachelor's level and social science, language, literature, media, culture, and social history at the master's level. The University of Greenland also provides a PhD program. Furthermore, Artek, a college of engineering located in Sisimiut, educates engineers in collaboration with the Danish Technical University (DTU).

According to official statistics, education levels have increased. Less than 30 percent of Greenlanders 16 years and older had a formal education beyond elementary

Chart 2: Number of incidents of disputes, violence and rape reported to the police, 2005–2015.

Source: Annual police reports 2005–2015 from www.politi.gl

school in 2003, but this has increased to 35 percent in 2013. Sixty-two percent of those completing an education in 2013 were women (Statistics Greenland 2016e).

More women than men completed formal education regardless of the level and despite dropout rates that exceed 50 percent for all education levels. This continues a trend that started in the beginning of the 1990s, but women have only recently exceeded the share of men completing vocational education and training.

At Ilisimatusarfik, women students are the majority in almost all subject areas, though they especially cluster in social work, journalism, teaching, language, literature, and media (see, e.g., Poppel and Chemnitz Kleist 2009, 346). This development is parallel to developments in many countries and regions of the world and has led to the creation of such new concepts as the feminization of the educational system. This development will impact gender relations in the labor market and in families (Poppel 2015).

Health

Greenlandic residents receive free health care from the Greenlandic public health care service. When the necessary resources are not available on the island, the Greenlandic public health care service pays for access provided by the Danish public health care service.

Life expectancy in Greenland is on par with countries such as Guatemala, Belarus, Turkey, and Morocco. From 2000 to 2004, life expectancy for males was 66 years and 71 years for women; in the following five-year period, 2006–2010, life expectancy increased to 68 years and 73 years, respectively (Naalakkersuisut Department of Health 2012, 10).

Access to Health Care

In a representative study from 2004 to 2006, Greenlanders were asked a number of questions about their health and the health care system. Ninety-eight percent reported they had access to a doctor or other medical professional in their community, and 96 percent said they were able to get the medicine they needed. At the same time, more than 20 percent were waiting to visit a specialty clinic, and 9 percent reported they had an untreated medical problem (Poppel et al. 2007).

The health care system is organized in five regions, each with a regional hospital, and 17 health care centers in the towns and the largest settlements. Due to the dispersed

settlement structure and limited resources, many health issues cannot be treated close to an individual's home. Thus, many residents have to be treated far from where they reside, and patients in a state of emergency have to be evacuated by airplane or helicopter.

To promote a healthy lifestyle, improve quality of life, and reduce health issues, the government has developed the Health Care Strategy 2013–2019, which focuses on reducing the abuse of alcohol and hash, reducing smoking, increasing physical activities, and encouraging healthier eating habits and diets (Naalakkersuisut Department of Health 2012).

Maternal Health

The maternity ward at Dronning Ingrid's Hospital in Nuuk (Greenland's capital) provides maternity care, counseling, obstetric care, and midwifery to pregnant women living in Nuuk. It also provides obstetric care and midwifery to women throughout Greenland. Pregnant women who live outside Nuuk and have a well-known risk during pregnancy are referred to give birth in Nuuk. The ward participates in an interdisciplinary cooperation focused on early intervention to prevent the neglect of children. A program called Ready for a Child, which is a collaboration between the maternity ward and the visiting nurses at the hospital in Nuuk, prepares women and couples for the birth and their new parental roles (Departementet for Sundhed 2012).

The birth rate for Greenlandic women has decreased rapidly during the last generation, paralleling a similar trend in Europe. The birth rate, the number of births per 1,000 women aged 15–49, in the first half of 1990s was 80, but the birth rate was 57.9 in 2014, with 801 births (5 of which were twin deliveries) registered. The World Health Organization (WHO) defines perinatal mortality as the “number of stillbirths and deaths in the first week of life per 1,000 total births” (WHO 2016). It begins at 22 completed weeks (or 154 days) of gestation and ends 7 days after birth (WHO 2016). In Greenland, perinatal mortality has declined; on average, it was 28 in the period 1976–1980, decreased to 14.2 in the period 2001–2005, and further decreased to 13.8 in 2014. The number of stillborn births was on average 7 in 1976–1980 and 5 in 2014 (Landslægeembedet 2014, chap. 3).

The infant mortality rate—the number of child deaths before turning one year old—was 13 per 1,000 live births in the period 2000–2004 and fell to 10 per 1,000 live births in 2005–2010. Despite this decrease, it was still considerably

higher than in its Nordic neighbors and a little higher or on a par with its Arctic neighbors (Departementet for Sundhed 2012,10).

Abortion

Abortion has been legal in Greenland since 1975, and the decision is the pregnant woman's alone. According to the chief medical officer, there were 860 abortions in 2014. The 2014 abortion rate, the number of abortions per 1,000 Greenlandic women aged 15–49, was 62.2. This rate has been relatively constant since 1996. The highest abortion rate is within the age group 20–24 (Landslægeembedet 2014, chap. 4).

Reproductive Rights

Contraceptives, such as contraceptive pills and coils as well as condoms, are dispensed free of charge from all hospitals and are accessible in schools and educational institutions. Sex education is a mandatory subject in the elementary school curriculum. Despite these initiatives, the number of abortions (800 annually on average in the period 2009–2013) has equaled the number of births in recent years, and the cases of several sexually transmitted diseases (gonorrhea, chlamydia, and syphilis) have increased for almost 10 years.

To counter or meet these problems, the Greenland government and the health authorities have launched several initiatives, such as the “Dolls Project,” in which students are instructed to take care of a programmed doll for several days. The goal of the project is to provide young Greenlanders with some insight into the consequences of an early motherhood and fatherhood. The project also educates schoolchildren about different kinds of contraception. Furthermore, one of the permanent tasks of visiting nurses and midwives is to provide information about preventing unwanted pregnancies. (Naalakkersuisut 2015b).

Diseases and Disorders

Life expectancy has increased considerably for both women and men since the 1970s, due in part to improved living conditions, such as better housing, and improved access to health care. Tuberculosis (TB) was considered almost eradicated in the early 1980s, but the number of incidences of tuberculosis has increased. Overcrowded apartments combined with malnutrition, alcohol abuse, and smoking among some low-income families have

created conditions for the transmission of TB. More men than women are affected; the TB incidence for women was 122.9 per 100,000 inhabitants in 2015 (Landslægeembedet 2014, chap. 7).

Combating sexually transmitted diseases has been a key priority for the Greenlandic health care system for decades. Despite some success in reducing the number of incidents, gonorrhea, chlamydia, and syphilis are being reported in increasing numbers. More than 1,500 incidents of gonorrhea were reported in 2015. The gender distribution is fairly even, but young women under the age of 20 are considerably more affected. For gonorrhea, the incidence rate ratio for women aged 15–19 was 1.79 from 2006 to 2012 (11,106 incidence rate) and for young men the same age and in the same time period was 1.48 (5,291 incidence rate) per 100,000 people (Johansen, et al. 2017). Syphilis and chlamydia incidents show the same pattern. Young women under the age of 29 are more affected than young men by syphilis, and young women under the age of 25 are also more affected than young men by chlamydia. For chlamydia, the incidence rate ratio for women aged 15–19 was 1.31 from 2006 to 2012 (31,718 incidence rate) and for young men the same age and in the same time period was 1.31 (13,386 incidence rate) per 100,000 people (Johansen, et al. 2017). HIV affects fewer women (38%) than men (62%). On average, less than five new incidents of HIV have been discovered annually since 2006 (Landslægeembedet 2014, chap. 6).

Roughly one out of four deaths in Greenland is caused by cancer among both women and men. For women, lung and colon cancers are the most common types that cause death. Heart and respiratory diseases each cause almost every 10th death of Greenlandic women (Landslægeembedet 2014, chap. 10).

Greenland has one of the highest suicide rates (110.4 for the years 2010 and 2011) in the world. Suicide among young men is particularly high. This is also observed in Nunavut, Canada, and among Alaskan natives. This suggests that young men face greater mental health problems than young women, but women have more suicidal thoughts than men, indicating that they have greater mental health challenges. In recent years, the data shows higher rates of suicidal thoughts by women in the east, the north, and in villages on the west coast (Bjerregaard and Larsen 2015). Whereas there are more female suicide attempts reported, there are more completed male suicides, 66–80 percent of all suicides between 2005 and 2013 (Statistics Greenland 2016d).

Employment

Chapter 4 in the Greenlandic Gender Equality Act focuses on the equal treatment of women and men with respect to employment and labor market participation. Paragraph 10 states, “All employers that employ men and women shall treat them equal when hiring, moving, promoting, and firing and provide equal working conditions” (Inatsisartutlov nr. 3 af 29).

Women’s participation in the labor market of Greenlandic women has increased since the 1950s. As of 2014, women comprise on average 46 percent of the total labor force aged 18–64 and 43 percent of the unemployed. While men cluster in several sectors of the economy, almost twice as many women hold public-sector positions in public service, social affairs, and health and education (Poppel and Chemnitz Kleist 2009).

Some have noted a shift of women moving away from the so-called sphere of reproduction as a result of the rise and society’s acceptance of women’s equal rights and of their fundamentally changed roles. Along with this shift, there has been a rise in public-sector jobs in education, health care, care of children and elders, and administrative workers, many of which have been filled by women. Thus, it has become apparent that women’s labor has moved from their household “sphere of reproduction” to a similar sphere in the labor market (Poppel 2015, 315).

State Action in the Formal Economy

Despite the good intentions and clear language in gender-equality legislation, the principle of equal pay for equal work has not yet been accomplished. Statistics Greenland made a partial analysis of personal incomes and concluded that women are one of the groups with the lowest incomes compared to their counterparts; others included youth 15–19 years old, people born in Greenland, and people living in the settlements. The analysis is based on 2014 data (Statistics Greenland 2015). The average male income was USD\$35,565 (247,000 DKK), while the corresponding figure for women was USD\$26,926 (187,000 DKK); men’s average income was 32 percent higher than women’s. A more detailed analysis shows a similar pattern regardless of whether men’s and women’s incomes are compared in municipalities, towns, or settlements or by age or place of birth. Income data does not show whether incomes are gendered for men and women in the same types of jobs or with the same or similar education. The data does clearly show that jobs typically held by women are often low-paid (Statistics Greenland 2015).

Women in the Informal Economy

Despite the rapid development of an informal economy since the 1990s, subsistence hunting and fishing is still a prevailing lifestyle in many, particularly smaller, towns and settlements. Although some women are engaged in harvest activities, the vast majority of hunters and fishers are men who provide food (meat and fish) for their households. Women often earn money, some of which goes toward covering the expenses needed to hunt and fish. In a traditional hunter’s household, there was a firm division of labor. The wife took care of “domestic affairs,” including the care of children and preparing what the husband harvested and brought to the household.

Family Life

In the 20th century, the average Greenlandic family has shrunk from 7.6 people in 1901 to 2.8 in 1999, and this trend is continuing. In 2009, the average family size was 2.2. The change is due to a decline in the importance of the extended family. For example, there are fewer three-generation family households. There has also been a decrease in fertility; thus, nuclear families are smaller. And the number of single-parent families, which are most often headed by a woman, has increased as well as the number of single households (Poppel 2015, 303).

This development mirrors a global trend that has been accelerated in Greenland in part by better housing facilities, increased female labor market participation, changes to the gendered and generational division of labor within a household, and the availability of day care institutions for children and homes for seniors.

Marriage and LGBT Rights

By law, both females and males must be 18 years old to marry. Same-sex marriage is recognized by law, and as of April 1, 2016, church weddings of same-sex couples were made possible (Sauvalle 2016).

The first association working for LGBT rights was established in 2002. The association was named Qaamaneq (the Greenlandic word for “light”). Qaamaneq focused on information and counseling. The association published a newsletter *Tendens*, meaning “tendency.” After promoting LGBT rights for five years, the association was abolished. A new association, LGBT Qaamaneq, was established in 2014. Gay Pride was first celebrated in Greenland in 2009 (Johnsen 2015).

Familial Economy

As more women receive an education and their participation in the labor market increases, they have increasingly become co-breadwinners and even more often the sole breadwinners in their households, primarily as single mothers. Research focusing on how changing gender roles influence perceptions of how women and men contribute to their households finds that a majority of Greenlandic women and men perceive that their most important contribution is economic, such as having a job, an income, and being able to pay bills. Nurturing, through love and affection, is seen as women's second most important contribution to the household by women and their male counterparts (Poppel 2015).

Politics

Women were granted the right to vote in 1948, more than 30 years after these rights were granted to Danish women. Encouraged by this new right and the opportunity to be elected, the first association for Greenlandic women was formed in Nuuk in October 1948. Soon after, associations formed in other towns. In 1960, the local women's associations were united in *Arnat Peqatigiit* (AP). Later that year, AP was admitted to the Danish Women's National Council, and the Danish Women's society set up a Greenland committee (Denmark History 2016). AP was formed to empower women and to encourage them to participate in parliamentary work. In the first election that women were eligible, the Greenlandic Women's Association nominated a candidate for Nuuk's municipal election. The candidate, Guldberg Kristoffersen, was elected and served from 1951 to 1955.

Legislation

The Council of Gender Equality in Greenland was established in 1998, and the first Greenlandic law on gender equality was passed by Greenland's Parliament in 2003 (Global-Regulation 2016). The two laws were merged into one law in 2013 (Inatsisartutlov nr. 3 af 29 2013). The Gender Equality Act on Equal Treatment states that gender discrimination is prohibited, and the mandate of the Council of Gender Equality in Greenland includes examining, on its own or by request, measures related to gender equality. The Gender Equality Act further states that there shall be equal treatment of women and men in the labor market, including equal pay for equal work. When public authorities and institutions nominate candidates to commissions and boards, the law demands that each authority

or institution nominate both a woman and a man to foster equal representation.

Participation in Government

Elisabeth Johansen (1907–1993) was educated as a midwife and became the first Greenlandic woman elected to the *Landsrådet* (the national council of Greenland). She was member of the council from 1959 to 1975 (KVINFO 2016).

The number of women in municipal councils increased when 24 women were elected to 18 municipalities in 1975. In the May 2013 election, 19 women were elected out of 70 total members (4 municipalities) (Kommunale valg 2013).

Since the introduction of Home Rule Act, and until 2005, an increasing number of women were elected to the Greenlandic Parliament; 13 of the 31 members were women. Women's representation increased sharply in the 2002 parliamentary election, from 19 percent to 36 percent (12 out of 31 members). In this election, *Arnat partiat* (the Women's Party) participated for the first time. No candidates from the Women's Party were elected, but the party succeeded in calling attention to different aspects of gender inequality, not least of which was the lack of female candidates in the different parties (Poppel and Chemnitz Kleist 2009).

Table 2 shows that the share of women in Parliament has stabilized at about 4 out of 10 members. The cabinet consists of 9 members, including the premier. After the 2014 election, 3 out of the 9 ministers have been women, which increased to 4 in the beginning of 2016.

Greenland elects two candidates to the Danish Parliament, and in 2015, both representatives were women: Aleqa Hammond, representing the Siumut, a social democratic party, and Aaja Chemnitz Larsen, of the Inuit Ataqatigiit, a left-wing party (Folketingsvalg 2015).

Religious and Cultural Roles

At 98 percent, a majority of the Greenlandic population identifies as Christian (Poppel et al. 2007). The vast majority are Protestants. There are, however, a number of other churches and religious beliefs. In addition, almost half of the Greenlanders consider indigenous religious beliefs as part of their lives (Poppel et al. 2007)

Celebrations

The Inuit have long celebrated solstice, the longest and the shortest days of the year, with social gatherings (the *Aasiviit*) where people gather to meet family and friends,

celebrate, exchange news, tell stories, trade, and solve social conflicts through drumming and singing. Since 1979, when the Home Rule Act was introduced, the summer solstice has been declared Greenland's National Day and is celebrated all over the country. During summer, the sun does not set for weeks or even months north of the Arctic Circle, depending on the latitude, and it does not rise during winter. This is why the return of the sun after months of darkness is also celebrated. Another celebration is Self-Governance Day, which was formally established on July 21, 2009.

Traditionally, the Greenlandic Inuit wore clothes made from animal hide, skins, and fur to protect against an often harsh, cold climate. Since the 16th century, contact between whalers and colonizers gave way to the introduction of other fabrics. Though the traditional women's costume was decorated and refined, it still consists of *kamiks* (boots), trousers, and anoraks. The Greenlandic national costume is used by most girls and women at feast days, such as Christmas and Easter, as well as at special occasions, such as christenings, confirmations, weddings, and funerals, and for other special days, such as the start of school, graduations, and Greenland's National Day.

Issues

Violence against Women

Violence against women has been identified as a significant problem in the Arctic and has been attributed, in part, to male loss of identity and self-worth, to societal tension, and to issues of power and control, and Greenland is no exception (AHDR 2004). Men's violence against women is a major problem, and it has been taboo to discuss, which has made it even more difficult to address. It is generally assumed that domestic violence incidents that are reported are just a fraction of the assaults committed (Grønlands Politi 2015). Some of the risk factors for violence against women include inequalities in living conditions, housing problems, changes in gender relations, and alcohol abuse, which can indirectly lead to additional problems (Poppel 2014).

Following increased documentation and public discussion about violence against women, the government developed a Strategy and Plan of Action toward Violence 2014–2017. The strategy includes 31 projects, and its overall goal is to consider the complexity of problems related to violence in all efforts toward creating well-being, health, and social inclusion (Naalakkersuit 2015, 2). Some of the

operational goals include improving support and counseling of victims of violence and establishing various forms of treatment for the perpetrators of violent crimes. In addition, the government aims to improve the development of interdisciplinary cooperation in response to acts of violence and to strengthen knowledge and information about the complex problems related to violence (Naalakkersuit 2015). In 2013, the Greenland police launched the pilot program Dialogue instead of Domestic Disputes in Sisimiut, Greenland's second-largest town (Naalakkersuisut, Government of Greenland 2013, 14).

Social Inequality

Since the creation of the first Danish modernization plans for Greenland following World War II, the goal has been to increase the living standards of Greenlanders and turn Greenland into a Nordic-type welfare state. Generally, living standards have increased, but there are still social and geographical inequalities. Measured by income (the Gini coefficient was 34 in 2014), inequalities are larger in Greenland than for the Nordic or the European Union member states on average and were on par with the United States (Statistics Greenland 2015).

Only in recent years has poverty been an issue, and research has documented that poverty, absolute as well as relative. It is part of the reality for a number of individuals and families, including families with children. Applying the risk of poverty (ROP) measure on Greenlandic households in 2014 concludes that 6–16 percent of households live with the risk of poverty (Statistics Greenland 2015). The Greenlandic part of the Survey of Living Conditions in the Arctic, SLiCA (conducted 2004–2006) reports that 26 percent of households in the settlements and 17 percent of households in towns find it difficult to make ends meet economically. The inequality between settlements and towns is somewhat, but far from fully, compensated by a larger contribution to household consumption by reliance on wild life and fish (Poppel 2010, 349–365). A study in 2010 documents that shortages of food in families that are not well off are reported by the children of these families (Nielsen et al. 2008).

Quality of Life

Satisfaction with individuals' quality of life, often condensed into the term *happiness*, is more frequently included in international comparisons of well-being. The Greenlandic part of SLiCA included this measure and found no

significant differences between women's and men's perceptions of quality of life: 92 percent of women and 95 percent of men reported that they were somewhat or very satisfied with their quality of life (Poppel et al. 2007).

Guatemala

Overview of Country

The Republic of Guatemala sits between Mexico, El Salvador, and Honduras in Central America. The Pacific Ocean borders it to the west and the Gulf of Honduras (Caribbean Sea) to the east. Its landmass is 42,042 square miles (108,889 sq. km) (CIA 2016).

With a total population of approximately 15 million, Guatemala is the most populous country in Central America today. Almost half of the population is under the age of 19, making Guatemala the youngest country in the Americas. Average life expectancy is approximately 74 years for women and 70 years for men. The national birth rate is more than three children per woman, with women in rural areas surpassing this rate significantly due in part to inadequate access to health care services and family planning resources. Despite reductions over the past five years, Guatemala continues to have a high infant mortality rate, with approximately 22 deaths per 1,000 live births per year, and ranks 64th in the world with a maternal mortality rate of 88 deaths per 100,000 live births (CIA 2016).

Two widespread and intractable social welfare concerns face Guatemala today: violence and deep socioeconomic inequity. A 2015 United Nations study ranked Guatemala 128th out of 188 countries in terms of inequality (UNDP 2015b). Monetary poverty affects indigenous and rural populations disproportionately, with rates of poverty at 79.1 percent and 76.1 percent, respectively. In comparison, 49.3 percent of nonindigenous peoples and 43.7 percent of urban dwellers live in poverty (UNICEF 2012). One out of every two children under the age of five suffers from

chronic malnutrition, which is attributable to low income, poor living conditions, and undereducation. A food crisis in 2009 and 2010 brought on by a severe drought, affecting more than 2.5 million Guatemalans, has also affected food security (UNICEF 2012). Guatemala remains in the top five countries worldwide in terms of risk and vulnerability to natural disasters. In the last several years, devastating tropical storms, droughts, earthquakes, and volcanic eruptions have caused significant economic and human losses. These environmental threats have exacerbated existing socioeconomic inequalities as well as resource and service deficiencies.

Social tensions created by these deep disparities create conditions for violence. Guatemala has a protracted history of state-sponsored and interethnic violence associated with its more than three decades of civil warfare, a period from 1960 to 1996 known as *La Violencia*, “the Violence.” Although there have been reductions over the past decade, there are still over 5,000 violent deaths per year in Guatemala. Philip Alston, a UN special reporter, labeled the country “a good place to commit murder,” as there is a single-digit conviction rate for the crime (Grandin et al. 2011). Vast inequalities in the post-civil war period also led to gender-based violence. Domestic violence and femicide, the murder of women and girls, continue to be major human rights concerns for Guatemalan women. In 2013, there were 31,836 reports of violence against women (IAC 2015, 107). The socially entrenched violence that emerged following *La Violencia* is compounded by Guatemala’s legal and penal systems that inadequately regulate gender-based crimes. Of more than 5,000 incidents of femicide from 2000 to 2009, only 11 cases ended with criminal convictions (Carey and Torres 2010, 161).

Guatemalan women have formed a strong base of anti-violence activism over the past decade. In 2012, Guatemala’s first female vice president (2012–2015), Roxana Baldetti, helped create a new department to address increasing violence toward women and develop programs targeting women’s education, leadership, and health. The Gabinete Específico de Mujeres (GEM, women’s cabinet) focuses on improving services for women victimized by sexual and domestic violence, increasing punitive measures and prosecution for these crimes, and empowering young women through educational programs and advocacy.

Guatemala is categorized as a rural country with urban pockets located near the capital, Guatemala City, and in the western municipality of Huehuetenango. Politically, Guatemala comprises 22 *departamentos* (states) and 333

Table 1 General Characteristics

Variable	Characteristic
Population	15,189,158 (July 16 est.)
Regions	8 regions
Latitude	15°13'N
Longitude	90°15'W
Territorial size	108,889 km ²
Climate	Hot humid in tropical lowlands; cooler in highlands
Subdivisions	22 departments
Languages	Spanish (official), Garífuna, Xinka, and 21 Mayan languages

municipios (municipalities). Municipalities are important units of social and political organization that delineate territorial ownership as well as indigenous linguistic and cultural identities. As stipulated in the 1995 Peace Accords passed by the UN General Assembly, Guatemala officially recognizes four population categories, or *pueblos*, based on culture and ethnicity: Ladino, Maya, Garífuna, and Xinka. Overall, approximately 41 percent of Guatemala’s population identifies as indigenous, while the remaining 59 percent identify as mixed heritage, *ladino/ladina*, or other non-Mayan indigenous (CIA 2016). According to a recent analysis of 2002 census data on language use, roughly 29 percent of self-identified indigenous people exclusively speak indigenous languages, while approximately 51 percent of this population group is bilingual in Spanish and an indigenous language (Yoshioka 2010, 8).

The term *Maya* refers to a diverse category of indigenous peoples that encompasses more than 20 linguistic groups. Indigenous individuals and communities tend to identify themselves using linguistic group names. Maya, K’iche’, Kaqchikel, Mam, and Q’eqchi’ are the largest linguistic groups within the broad category of Maya. Garífuna communities trace their heritage to both African and indigenous origins, predominantly Arawak and Carib groups, who originally inhabited the Caribbean coast of Central America. Today, Garífuna peoples primarily reside in the *departemento* Izabal in the eastern coastal region. Xinka communities identify as non-Mayan indigenous

peoples with a distinct cultural and linguistic heritage. Xinka are heavily concentrated in the central-southern highlands municipalities of Jutiapa and Santa Rosa.

Since the 1980s, a pluriethnic group of activists known as the *movimiento maya*, or Pan-Mayan Movement, has worked to preserve the human rights and culture of Guatemalan indigenous groups. The movement, secular and democratic in nature, seeks to unify the country's diverse indigenous communities by acknowledging and securing their claims to cultural and political power, human rights, and access to land and resources (Warren 1998). Guatemalan indigenous women have played active roles in the movement and have represented their communities in international forums, such as the Summit of the Americas and the Continental Summit of the Indigenous Peoples of the Abya Yala.

Overview of Women's Lives

While it is difficult to generalize about the lives of women and girls in a multiethnic, multilingual country like Guatemala, it is safe to say that the last several generations have experienced great adversity and developed striking resilience. Guatemalan women, despite their ethnic, linguistic, regional, and socioeconomic diversity, have withstood decades of top-down repression that has come in many forms. Gender-based violence and marginalization, social and cultural inequalities, and civil unrest have presented formidable challenges for all Guatemalans over the last century. During *La Violencia* women became specific targets of state terror and brutality. Despite this targeting, women played integral roles in the period of peace brokering that followed the civil war and have continued to stand at the front lines of human rights advocacy and activism. Gains are reflected in its 2014 Gender Inequality Index (GII) ranking of 119th out of 188 countries, placing it in the medium human development category (UNDP 2015a).

Today, disparities in education, employment, and public health access as well as domestic violence and poverty rank among the most pressing social concerns for Guatemalan women. Yet, as generations before them have done, 21st-century women and girls have found ways to resist by using grassroots activism, political protest, artistic expression, and international alliances. One example of such resistance was the founding of the Red de Solidaridad de Maquila (Maquila Solidarity Network), an organization that defends workers' and women's rights by promoting dialogue and activism across Guatemala and with

international partners. In 2014, the organization celebrated 20 years of work in raising awareness about hazardous working conditions, wage disparity, gender discrimination, and labor exploitation. The Maquila Solidarity Network has forged alliances with women's workers' groups across the Americas as well as in other parts of the developing world, such as Bangladesh, Pakistan, and China. Another pioneering women's advocacy organization is el Grupo de Mujeres Mayas Kaqla (Kaqla Mayan Women's Group) founded in 1996. Known as *Kaqla*, a K'iche Mayan word meaning "rainbow," the group promotes women's leadership and development by teaching therapeutic reflective methods to foster healing after years of violence and oppression. Stakeholders in this organization have forged alliances across generations, language groups, and ethnicities as well as in conjunction with international women's rights groups. These examples of interconnectivity among Guatemalan women and in solidarity with women across the globe typifies the metaphor of "togetherness" or "unity" that is central to the Mayan sacred text called the *Popul Vuh*. As Calixta Gabriel, a Cachiuel activist and spiritual leader, summarized, "Like the Popul Vuh says, we all go forward together. No one stays behind. We all walk together. And we believe this to be true" (Alderete 1992, 28).

In the postconflict era, Guatemala's government has integrated gender inequalities and gender issues into its development planning goals. Fifteen entities related to gender concerns exist within various levels of government today. The Unidad de Género, a federal department created in 2014, specifically works in the area of gender equity alongside SEPREM (Presidential Secretariat for Women) and GEM (Special Cabinet for Women) (UN Women 2015). Although gendered discrimination rooted in colonial-era patriarchy continues to create power imbalances between women and men, these federal initiatives recognize gender justice as a fundamental part of human rights.

Girls and Teens

Guatemala is a young country. It has a high birth rate, and approximately half of its total population is under the age of 18. In 2013, adolescent girls (ages 10–19 years) represented 11.6 percent of the total population (15.4 million) (INE 2011). In 1990, the Guatemalan legislature adopted the UN Convention on the Rights of the Child, recognizing that children and adolescents have rights to education, protection, and health from birth to age 18. In recent years, the federal government, in conjunction with UNICEF and

other international nonprofit organizations, has made strides to study and address problems facing Guatemalan youth. Budget allocations for programs aimed at children and adolescents have grown from USD\$167 per child in 2009 to USD\$222 per child in 2012 (UNICEF 2012).

Education

Guatemala's modern educational system is rooted in campaigns introduced during the post-1944 revolutionary presidencies of Juan Jose Arevalo (1904–1990) and Jacobo Arbenz Guzmán (1913–1971). These leaders greatly expanded educational opportunities and outcomes by sponsoring literacy campaigns, rural schooling programs, and teacher training. Although the 1954 U.S.-backed military coup interrupted the full actualization of these programs, the vision for a universal national educational system remained an important precursor for future regimes.

Today, Guatemala's educational system retains a federal structure, governed by the Ministry of Education, which oversees the administration and delivery of the public school system through state and local offices. Public schooling is compulsory and free or low-cost; yet, many of the country's rural and urban poor families face financial strain in sending their children to school. Transportation costs, associated fees, and foregone labor or wages create some of the economic hardships associated with school attendance. Public schools also lack adequate resources, such as technology and content materials. Teachers are often underpaid and undertrained. Wealthy Guatemalan families often send their children to well-resourced private schools or schools abroad. A social divide accompanies this segregated educational system; wealthy, influential elites receive superior education and have more access to employment and opportunities in higher education. Likewise, families enrolled in private schools have little incentive to support funding for public schools because they do not use their services.

The state is obligated to provide at least nine years of basic education to all children from ages 4–15. Roughly

39 percent of citizens aged 15–29 do not advance beyond the level of primary education. Although literacy rates have improved over the last decade, teens and women, ages 15–29, continue to have lower literacy rates than their male counterparts, 92.1 percent and 94.8 percent, respectively (INE 2011). At 30 percent, indigenous women have the lowest literacy rates (Reading Village 2012).

On average, Guatemalan girls tend to drop out of school around age 15 and often without completing what the National Ministry of Education (MINEDUC) defines as the mandatory basic level of education. According to a 2011 study, adolescent girls and women aged 15–29 identified a lack of financial security for themselves and their families as the major factor in their decision to leave school (INE 2011). Low food intake and the burden of household duties among rural and indigenous children have also been reported as major contributing factors to the high dropout rate. While some girls and teens combine schooling with employment in the informal sector, rural indigenous girls tend to leave school for full-time work at higher rates than their nonindigenous counterparts. Indigenous children are also less likely to enter into preschool, which the MINEDUC considers an essential part of basic education.

In 2012, the Guatemalan Ministry of Labor launched a program that offered food assistance to poor families as an incentive for school attendance. Other similar programs, for example, Food for Education, which is funded by the U.S. Department of Agriculture, targets girls in rural areas by providing take-home food scholarships to increase school enrollments. The food rations given to families are intended to compensate them for the girls' foregone wages and labor while they attend school.

Another barrier to consistent and quality education relates to a disregard for Guatemala's rich cultural and linguistic diversity within the public school system. Few bilingual learning environments are available for the large percentage of indigenous children whose households' first language is not Spanish. Less than one-third of indigenous children are enrolled in bilingual education programs,

Table 2 Primary School Enrollment for Girls by Age (6–15 Years)

	National Total	Age 6	Age 7	Age 8	Age 9	Age 10	Age 11	Age 12	Age 13	Age 14	Age 15
%	57.26	23.52	78.86	80.79	82.69	85.21	84.09	68.21	34.43	17.04	10.43

Note: Rates of enrollment represent the national-level percentage of girls enrolled in the educational system.

and no public schools incorporate the Mayan cosmovision or spiritual beliefs into their curricula. Indigenous identity, rural living, poverty, and female gender continue to have an adverse, overlapping effect on education levels in 21st-century Guatemala.

In 2012, the federal government adopted an assessment tool developed by UNESCO, called *Sistema Nacional de Indicadores Educativos* (SNIE, or National System of Education Indicators) to measure educational levels with more nuanced attention to ethnicity, poverty, and gender (Ministerio de Educación 2013, 5). These new modes of measurement have illuminated the persistent gaps in educational attainment for indigenous girls living in rural poverty. As a result, a number of governmental, private, and international entities identify young indigenous girls living in impoverished rural areas as a targeted demographic for school access improvements, literacy interventions, and scholarship programs. One such program, *Cooperación Para La Educación* (COED, or Cooperation on Education), offers annual scholarships for school enrollment fees to approximately 100 rural-dwelling, Mayan girls. Of those recipients, almost all complete elementary school and continue to receive a high school diploma.

Health

Access to Health Care

Guatemalan girls and teens also face health challenges related to the country's deep socioeconomic inequalities. The population's cultural and linguistic diversity creates challenges in the provision of public health services. State-sponsored medical care operates within the Western biomedical model, and Spanish is the common language used by medical professionals. Indigenous Guatemalans often adhere to ancestral health knowledge and practices, and the medical community and health policy makers often ignore these centuries-old customs. The 1996 Peace Accords and subsequent legislation included provisions to recognize and uphold indigenous Mayan medicine; yet, federal programs, often backed by international development aid, have continued to marginalize traditional approaches to health and healing (Perén 2007, 6). Many indigenous communities also inhabit remote areas that remain beyond the reach of the state, often served by itinerant health workers with few resources and large patient populations. The lack of adequate health care infrastructure, personnel, and services in these areas creates further challenges for policy makers and providers who aim to

improve health. While Guatemalan girls and teens in the 21st century, both within and beyond indigenous communities, face myriad health concerns, domestic abuse, hunger, and reproductive and sexual health generate some of the most alarming health statistics.

Following the 1996 Peace Accords, the federal government reformulated its health care system. However, in the 21st century, Guatemala has one of the worst overall health profiles of any country in the Western hemisphere. Access to adequate medical care remains one of the major barriers to development. Nationwide, there are about 3 doctors per 100,000 inhabitants (as of 2014) and 60 hospital beds for every 100,000 people (World Bank 2016b, 2016c). Guatemala also has one of the lowest health expenditures in the Americas; the federal government spends approximately 6 percent of the national gross domestic product (GDP) on health care (CIA 2016). Where these basic health services exist, specialized services for maternal and infant care often do not.

Lack of health infrastructure and services in rural areas, particularly in the central highlands, follows a general paucity of public utilities and sanitation, such as sewerage, indoor plumbing, access to clean water sources, and waste disposal services. For example, 2015 estimates show that 49 percent of rural households had access to sewage service compared to nearly 77 percent of homes in urban areas (CIA 2016). The absence of basic services compounds health problems in rural areas by creating insalubrious living conditions. Women and young girls whose lives remain tied to the domestic sphere are particularly at risk for health complications due to a lack of basic sanitation and clean water. Women and girls often travel long distances to carry water and firewood for fuel to and from their homes. In homes lacking electricity, females, charged with cooking over wood- and coal-burning stoves, often develop respiratory illnesses. Where health care services exist in rural settings, personnel often lack both indigenous language skills and knowledge of indigenous health and healing practices. The combination of geographical isolation and a lack of culturally and linguistically competent services creates vast gaps in health between rural and urban and indigenous versus nonindigenous peoples.

Maternal Health

Reproductive and sexual health concerns also significantly affect female adolescents in both urban and rural settings. Among Central American countries, Guatemala has the

highest birth rate, 3.2 children per woman (World Bank 2016a). Among sexually active teens, ages 15–19, 55 percent reported that they did not use contraception, and among married teens, 26 percent did not, despite wanting to avoid becoming pregnant (Guttmacher Institute 2014). Indigenous and rural adolescents tend to become sexually active and enter into marriage at younger ages than their urban nonindigenous counterparts.

Guatemala's penal code categorizes the impregnation of a girl under the age of 15 as a criminal offense. Despite recent calls for reform, this law allows the perpetrator to request consent from the girl's father in exchange for a lighter sentence. This form of codified patriarchy and the dismissal of sexual violence as a crime traces its roots to the colonial era, when women and girls were considered to be under the protection and rule of their fathers and crimes such as rape tended to go unreported or unrecognized by colonial authorities. Rather, fathers and other male family members pursued personal retribution for their daughters' and wives' lost honor (Komisaruk 2008, 171).

Today, several state agencies and advocacy organizations seek to raise awareness about reproductive justice, sexual and domestic violence, and sexual health for young girls. The National Ministry of Education supports an integrated sexual education curriculum; however, political and social opposition has prevented the teaching of sex education courses at the local level in many areas. Most school systems that offer sexual education do so according to local customs and practice, rather than according to health guidelines or medical information. School systems and nonprofit organizations sponsor a number of extra-curricular programs to raise awareness about pregnancy prevention among teens. During October, women, girls, and advocates celebrate an annual World Pregnancy Prevention Day and International Girls' Day to draw attention to some of the most pressing concerns facing the country's female youth.

Guatemala's maternal mortality rate is 140 deaths per 100,000 live births, which is far higher than the 2015 Millennium Development Goal of 55 per 100,000 (UNICEF 2014, 3). Rural areas within majority indigenous populations report higher rates of maternal mortality, around 200 per 100,000 live births (UNICEF 2014). One of the major issues creating gaps in maternal and reproductive health involves the conflict between traditional indigenous prenatal and birthing practices and those of Western biomedicine. Mayan ancestral tradition centers on the traditional birth attendant, known as a *comadrona* or *iyoom*.

Women's Voices

Lolita Chávez

Lolita Chávez Ixcaquic is a K'iche' human rights defender in Guatemala. As a leader and spokesperson for the K'iche' People's Council (CPK), Lolita has led peaceful resistance by indigenous Mayans to large-scale mining and hydroelectric projects in Guatemala's El Quiché region. "Our movements are based on ancestral principles of equilibrium and reciprocity," she explains. "They are intergenerational, promote respect for Mother Nature and all living things" (GHRC 2013). Chávez also connects the violence against the land to violence against women. She points out, "Women in our community have focused on recreating our individual and collective identities and what it means to be a Mayan woman.... This has been a process of healing, where we have talked about the autonomy of our peoples, but also autonomy within autonomy. Because in my nation, there's patriarchy, and sometimes it's worse than other barriers because it is so intimate" (JASS 2016).

Chávez herself has been subjected to violence, including a 2012 attack by armed men. Still, she continues to fight for the rights of her people.

JASS. 2016. "Maya K'iche' Leader Says No to Violence against Women." Retrieved from <http://www.justasociates.org/en/womens-stories/maya-kiche-leader-says-no-violence-against-women>.

These women are often elder laywomen midwives in the community who possess traditional knowledge of Mayan antenatal and birth practices, maternal and infant health, and herbal medicine passed down through generations. In addition to assisting with births, attendants provide antenatal and postnatal care, which can include a range of duties, such as massage, housework, and emotional support. Within Guatemala's remote highlands, home births performed by attendants account for 90 percent of all births (Replogle 2007, 177).

In recent decades, traditional birth attendants have been persecuted for perpetuating high infant and maternal mortality rates in rural indigenous regions. International health agencies and federal programs have initiated various interventions to steer rural women toward hospital care as a way to improve maternal and infant health indicators. Such programs tend to ignore indigenous cultural beliefs and practices in favor of Western medical approaches centered on professionally trained physicians, clinics, technology, and pharmaceuticals. In recent years, international and national public health policy makers have moved toward equipping traditional birth attendants with technology and providing trained midwives to remote regions. To strengthen the recognition of *comadronas* and their value within indigenous birthing traditions, the Asociación de Comadronas de Mam (Mam Midwives Association) formed in the late 1990s. Across this network, indigenous women share knowledge and training with younger generations, fortify political representation, and preserve traditional health practices.

The lack of access to contraception and restrictions on women's reproductive rights create additional health and welfare concerns. About 40 percent of sexually active women utilize some form of contraception (Guttmacher Institute 2014). Women living in impoverished rural regions have some of the highest unmet needs for family planning education and services. Like its neighbors in Latin America, Guatemala has some of the world's most restrictive reproductive rights laws. The influence of the Catholic Church and centuries-old notions of patriarchy and female honor create a climate of social stigma that restricts women's reproductive sovereignty.

The country's penal code defines abortion as a criminal offense punishable by imprisonment of up to three years. Women suffering life-threatening complications can seek a legal abortion, but few public hospitals perform abortions. Given these restrictions, women seek alternative methods to terminate pregnancies, including clandestine abortion. For every six births, there is one abortion in Guatemala (Singh et al. 2006, 136). Guatemala's Reproductive Health Observatory estimates that 65,000 abortions are performed or induced each year and that around 178 unsafe abortions occur each day (Singh et al. 2006, 136). However, exact rates of illegal abortion are difficult to obtain, and these estimations often reflect the frequency with which women attempting abortion seek emergency services in hospitals and clinics. The Asociación Pro Bienestar de la Familia (Association for Family Welfare) has pressured the federal government to frame reproductive rights as human rights and integrate family planning and

sexual and reproductive health care into the nation's development goals.

Diseases and Disorders

Chronic malnutrition among a large percentage of the child population has resulted in Guatemala being ranked third in the world for growth stunting, behind Afghanistan and Yemen. Of children under age five, 48 percent suffer from severe growth stunting (UNICEF 2013). Approximately 35 percent of children suffer from anemia related to malnutrition (Monterroso 2012). President Otto Pérez Molina initiated the Pacto Hambre Cero (Zero Hunger Pact) to address the high levels of malnutrition and chronic hunger by distributing food to at-risk families along with financial remittances to promote school attendance. While the campaign aimed to reduce chronic hunger by 10 percent among children under age five, it reported a 1.7 percent reduction by 2015 and an expenditure of 73 percent of the allocated funds in 2014 (Zero Hunger Challenge 2015). Indigenous groups are the most affected; 69.5 percent face chronic hunger (World Food Programme 2017). These high levels of hunger and malnutrition are deeply intertwined with uneven development, decades of land rights violations against indigenous communities, and the slow integration of modern farming practices.

Women and girls face reproductive and sexual health concerns related to the spread of HIV/AIDS. Approximately 21,000 women aged 15 and over live with HIV, representing about 38 percent of cases overall. Children are also affected. About 2,000 children under the age of 15 live with HIV, and 11,000 children aged 17 and younger are orphaned as a result of HIV (UNAIDS 2015).

Although federal legislation criminalizes all forms of domestic violence, it persists as a major health concern for women and girls. Social inequality and the uneven application of the law overlap to create prime conditions for domestic violence to thrive with impunity. Today, 9 out of 10 victims of domestic violence are women, and violence against women ranks as the second most common crime overall. The majority of these women are 19–34 years of age, and they were victimized by either a spouse or cohabitant. Most of the reported incidences are categorized as physical and psychological abuse, meaning that women are often simultaneously enduring emotional, verbal, and physical violence at home.

Since 2004, the number of reported incidences of domestic violence has increased by over 400 percent, from around 8,000 per year to over 32,000 per year (INE 2014a).

Survivors of domestic violence often endure the compounded burdens of the pain of abuse, social exclusion, and financial insecurity. Although reporting of domestic abuse has increased over the last decade, many perpetrators are not convicted or penalized. Notably, in 2008, the Guatemalan government reformed the federal constitution to include a law against femicide and other forms of violence against women. To ensure the application of this new law, Guatemala's attorney general opened 12 new special prosecutor's offices, including a 24-hour women's court in the capital. In addition to these measures, federal and local authorities increased the provision of survivor support services and worked with both national and international human rights groups to increase educational campaigns. In recognition of the high incidence of violence against women and elevated homicide rate for women, Guatemala's Public Ministry also developed a specialized federal unit to monitor these crimes and ensure adjudication. The *Fiscalia de Delitos contra la Mujer* (Special Prosecutor for Crimes against Women), headquartered in the federal capital, holds investigatory and prosecutorial rights over all crimes reported against women and girls. State and local offices supply communities with protocols and contact information for reporting incidences of violence, and the department stewards the cases through the justice system. This effort has increased the reporting of crimes against women, and, accordingly, there has been an overall rise in this sector of crime statistics.

Employment

Gender inequalities persist within Guatemala's labor sector. Women, particularly rural and indigenous women, face higher rates of unemployment, lower wages, exploitative labor environments, and less access to social welfare and health benefits compared to men. Women often work in the informal labor sector, in part-time positions, or in unremunerated domestic or agricultural labor. For these reasons, it is often difficult to ascertain an accurate statistical measurement of women's actual labor contributions and earnings. In addition to their labor as caregivers within their families, women often work in domestic or "cottage" industries and in small-scale manufacturing, which leaves them outside the reach of federal labor data collection. In some cases, patriarchal social norms constrict women's roles to being the "face" of a business or as public vendors and entrepreneurs.

Although women outnumber men demographically, only 42 percent of women are employed in the formal

labor sector, compared to 85 percent of the male population. Nationally, women represent an estimated 79 percent of the population categorized as "economically inactive" (INE 2014b). Guatemala reports some of the lowest unemployment rates among Latin American countries, with an aggregated rate of 3.2 percent (INE 2014b). Separated by gender, women's and men's unemployment rates are 3.6 percent and 2.4 percent, respectively (INE 2014b). Rural and indigenous women report some of the highest rates of unemployment. From 2000 to 2013, unemployment among indigenous women increased eightfold (INE 2014b).

To address gendered inequalities, the federal government adopted the International Labor Organization's (ILO) conventions on labor equity and initiated policies and programming to address women's labor concerns. For example, the *Diálogo Social para Trabajo Decente* (Social Dialogue for Decent Labor) has launched investigations into the informal labor sector and made policy recommendations to increase women's rights and inclusion within the economy. Guatemala's government has also pledged its commitment to the UN Guiding Principles on Human Rights as it applies to women's labor, specifically the "Ruggie Framework," referencing UN Special Representative John Ruggie, which pledges to protect, respect, and remedy workplace and income inequalities.

Women continue to face income inequality in all labor sectors. While the income gap has decreased over the last decade, from women earning 62 percent of male wages in 2000 to 84 percent in 2013, women still earn considerably less than their male counterparts (INE 2014b). Women and girls earn less than their male counterparts in all major employment sectors of the formal economy. For example, women aged 25–34 earn an estimated 70 percent of what their male counterparts earn per month (ILO 2013). Indigenous women also bear the burden of a higher wage gap than nonindigenous women. While the total income gap between men and women nationally is 16.3 percent, among indigenous women, it is 45.5 percent, compared to 4.8 percent among nonindigenous women (INE 2014b).

Guatemala's economy depends on three principal export crops: coffee, sugarcane, and bananas. The majority of the population, a combined 60 percent, works in agriculture and commerce, while the remaining labor force works in manufacturing and within the informal economy (13%). Among agricultural workers, women, both indigenous and nonindigenous, earn about half of male agricultural laborers (INE 2014b). Approximately 70 percent of the female population works in the informal economy and without access

Figure 1 Monthly Income of Salaried Laborers by Sex and Region (in Quetzales)

Source: Instituto Nacional de Estadística. 2016. "Encuesta Nacional de Empleos y Ingresos": 39.

to health and social security benefits or legal protections against exploitation or unfair labor practices (INE 2014b).

Young girls under the age of 14 represent 20 percent of the agricultural workforce (ILO 2013). Indigenous girls and adolescents 7–17 years old who live in rural areas are almost twice as likely to be employed as those in urban settings (INE 2014b).

One of the major concerns facing women in the agricultural labor sector is the lack of access to property ownership. Women account for less than 25 percent of the landowning sector, and when they are exclusive property owners, they often own small parcels used for family subsistence farming (ILO 2013). This trend reflects the colonial land distribution pattern in which the Spanish crown granted land and laborers, often indigenous laborers, to wealthy male heads of household. Following this custom, today's women tend to become principal property owners through inheritance rather than purchase. Sixty percent of working children are of indigenous heritage, and indigenous girls overwhelmingly work in domestic service and agriculture (INE 2011). The labor code has inconsistencies that make exceptions for child labor under age 14.

Urban migration has had a significant impact on the geographical distribution of Guatemala's employment

sector. Historically, men migrated to urban centers more frequently than women; however, the expansion of manufacturing and service jobs over the last two decades has attracted rural women to cities for wage labor. Today, the demand for low-wage labor in manufacturing and services in urban centers creates a space for poor women to earn a living. Poor migrant women also often find low-wage employment as child care providers and in other domestic jobs for urban families.

Rapid urbanization over the past three decades has drawn rural families to metropolitan centers in search of wage labor, particularly in industrial and consumer product manufacturing. Overcrowding, competition for jobs, and a lack of social supports have created opportunities for increased violence. Families often suffer the effects of overworking and strained resources, resulting in an increase in the number of urban youth delinquency and gang activity.

Recent studies shed light on young women as they have become both participants and victims of the gang culture that has emerged, particularly in the capital, Guatemala City. The number of female prisoners nationwide has doubled in the past nine years, and experts attribute this rise to increased gang activity (Tatone 2013). Known as *maras* or *pandillas*, gangs often attract female members

by appealing to their needs for social inclusion, autonomy, and power and as an alternative to life in the domestic sphere (Winton 2004, 87). Other studies suggest that gang affiliation and activities provide young women with the opportunity to express an alternate identity and rebel against patriarchal authority. Gang membership creates an interesting double bind for young women as they are simultaneously exploited by male members and expected to demonstrate male-associated behaviors, such as physical violence on rivals and wearing men's clothing (Cawley 2013). Although gang affiliation can be considered a form of resistance and mitigation of persistently unequal gender roles in Guatemalan society, women and teens involved in *maras* are often on the receiving end of violence within the gang or within penal institutions if they are arrested. Public schools, in conjunction with the federal police, have begun offering dialogues and forums aimed at reducing the number of young girls and teens who join gangs.

Family Life

Gender roles in the Guatemalan household vary by region and ethnicity; however, in the postcolonial context, perceived male dominance and accompanying attitudes of male superiority, referred to in Spanish as *machismo*, strongly influence how young girls view themselves and their roles in society. The conquest and colonization of indigenous peoples by Spanish rulers significantly ruptured the more equitable gender roles of pre-Columbian indigenous societies. Iberian culture and gender roles challenged the complementarity between men and women that had existed for centuries among the diverse peoples inhabiting Mesoamerica. Under colonial rule, labor and economic structures, including the forced labor of indigenous men, altered the positions of men, women, and children in the household.

In the postcolonial period, Liberal elites used the forced labor of indigenous men and women, particularly on coffee plantations, as the primary means of economic development. Rural indigenous men, women, and children worked side by side harvesting coffee in a codified system known as the *mandamiento*, or forced labor drafting (McCreery 1994, 220). Particularly in rural areas, agricultural work within the *mandamiento* system created some opportunities for women as wage earners and gave them more mobility outside of the domestic sphere.

Catholicism also greatly influenced perceptions of gender roles in Guatemalan colonial society by establishing a

patriarchal social hierarchy and a set of ideals that defined womanhood and motherhood. These principles varied according to race, ethnicity, socioeconomic status, and region. In urban settings, for example, the social positioning of *ladino*, or mixed-race, middle-class women, as well as European-descended elite women allowed them to embody and uphold Catholic virtues. Middle-class and elite women could remain in the home and raise their children. Rural, indigenous, and impoverished women, however, diverged by working outside the home, rupturing the conventional sexual division of labor defined by the Catholic Church and the Guatemalan ruling elite.

During the 1980s, the dynamics of Guatemalan families changed significantly because of an increase in male out-migration from rural areas to major cities. Male heads of household often left women and children behind in search of wage labor and to avoid being killed by paramilitary forces. They out-migrated to Mexico and the United States during the 1980s and 1990s, creating dislocations and family restructuring. In 2011, an estimated 21 percent of households were categorized as female-headed (Gandelman 2008, 15).

In the 21st century, Guatemalan society remains highly divided along class, gender, ethnicity, and racial lines. A national women's watch group, the Grupo Guatemalteco de Mujeres (Guatemalan Women's Group), summarizes contemporary gender relations as being dominated by sexist stereotypes that devalue women as human beings. Ideas about women are limited to roles of childbearers, caregivers, and sex objects, resulting in behaviors where women will ignore their own rights.

Within the household, girls' and teens' roles vary depending on the family's financial status, gender balance in the home, and a child's birth order among her siblings. In terms of socioeconomic status, 93.9 percent of adolescent girls categorized as *poor* and 95.4 percent of those considered *extremely poor* forego education and employment for domestic duties (INE 2011). Among indigenous communities, the eldest girl bears the responsibility of caring for younger siblings, and she may forego her education to attend to these domestic obligations. Families often prioritize the education of male children, while girls' options for education, future employment, and social mobility remain constrained due to home and family obligations (Colom et al. 2004, 3). When they are not performing domestic duties, working, or attending school, adolescent girls enjoy a range of social and physical activities. A large percentage of both young men and women participate in

religious groups that allow for socialization outside the family unit.

Age at first marriage has been a contentious social issue in Guatemala. In rural areas, over half of women aged 20–24 were married before age 18, and 13 percent of them married before age 15 (Amin 2011). Since 2012, the country has registered 80,000 child marriages (Plan International UK 2015). Child marriage is most common among the rural indigenous communities where cultural perceptions of marriage differ greatly from Western Judeo-Christian norms. Pre-Columbian peoples considered marriage as a natural pairing for procreative purposes, an obligation to society, and as a form of worship in Mayan cosmology. Gender roles were more complementary, and polygamy was practiced by male elites in Mayan society.

The arrival of Spanish authorities shifted practices. The imposition of colonial religious and civil codes increased the rate at which pubescent girls became legal spouses. Patriarchal social organization and Catholic indoctrination gave rise to the subjugation of women, reducing young girls' ability to escape early marriage and erasing gender complementarity. In 2015, Guatemala's Congress raised the minimum legal age for marriage from 14 (girls) and 16 (boys) to 18 (all); however, provisions still exist for younger girls to be granted legal exceptions to marry. Fifteen lawmakers voted against this measure, demonstrating that cultural ideas about child marriage remain fixed for some segments of the population.

Guatemala seeks to comply with the UN Sustainable Development Goals, which include the termination of child marriage by 2030. Early marriage perpetuates adolescent pregnancy and its accompanying health risks for mothers and infants. Likewise, early marriage reduces the chance for the completion of basic education and hinders a woman's autonomy. Recently, indigenous girls and women have joined in the transnational campaign *Por Ser Niña* (To Be a Girl) to reduce the instances of young marriage, teenage pregnancy, and sexual abuse. Education and awareness form the basis of this campaign, which aims to raise self-esteem and knowledge about sexual health and human rights among indigenous girls.

Politics

During the colonial era, women faced exclusion in both religious and civil life. Colonial civil codes and the Catholic Church tightly regulated women's lives and behaviors in the public sphere, subordinating them to their male counterparts. Despite Guatemala's independence in 1821,

women were not granted equal citizenship. European ideas of "republican motherhood" prevailed across Latin America, relegating women to reproductive and domestic duties and precluding their participation in politics. Guatemala's patriarchal social order has circumscribed women's roles in formal politics. Despite this, during the Guatemalan Spring, a national revolutionary process that occurred between 1944 and the 1954 coup, women played integral roles in advancing labor and land rights reforms. Women participated directly in public protests in the capital and helped form new political parties, such as the *Unión Femenista Guatemalteca Pro-ciudadanía* (Pro-Citizenship Guatemalan Women's Union), which overtly promoted women's rights (de Ita 2012). The 1945 constitution granted literate women over the age of 18 full citizenship rights and the right to vote, disproportionately disadvantaging rural indigenous women. An urban feminist movement emerged briefly following the October Revolution of 1944, and working-class women benefited from a more regulated labor system, maternity benefits, and increased access to education and health services (Miller 1991, 126).

These advancements were stifled by a return to a repressive patriarchal rule following the U.S.-backed 1954 military coup. In 1965, the federal government expanded suffrage to illiterate women; however, women's participation in elections remained constricted by patriarchal social norms. The decades-long civil war that erupted in the 1960s prevented women from exercising their political rights. Since the first democratic presidential election in 1985, women have consistently trailed men in terms of voter registration and participation in elections. In 1993, an estimated 85 percent of men registered to vote compared to around 65 percent of women. The gap has diminished in recent years; about 90 percent of men and 84 percent of women registered to vote in 2012 (Azpuru 2013, 1). Voter registration and voting rates remain lower among rural indigenous women.

In the aftermath of prolonged civil conflict, women have gained traction in politics, particularly as arbiters for human rights violations, disappearances, and killings. A section of the 1996 Peace Accords articulated a plan to increase women's political participation. The declaration aimed to improve women's access and expand public consciousness around the gender gap in politics using educational campaigns and propaganda. An important step involved the formation of the *Foro Nacional de la Mujer* (National Women's Forum). Initiated in 1997, this group grew to 25,000 members and directed its efforts toward

Women's Voices

Rigoberta Menchú Tum

In the latter part of the 20th century, the federal government focused renewed energy on justice and gender equity, which was a positive outcome of the nation's protracted civil war and violence that ended in the late 1960s. Women became powerful stewards of this facet of national reconciliation and development, and they continue to work as activists at the local, national, and international levels.

In 1992, on the quincentennial of European contact in the Americas, Rigoberta Menchú Tum, a K'iche' Mayan woman from the rural highlands, won the Nobel Peace Prize. This prestigious honor brought attention not only to the nation and its traumatic history, but to the inequities facing women, particularly indigenous women across Latin America. Her international notoriety, despite its controversies (Strauss 1999), symbolized a new chapter for women in the region and in Guatemala more specifically. In her acceptance speech, Menchú Tum hoped the new millennium would bring "new relationships of respect and equality" (Nobel Foundation 1992).

Indeed, Guatemala's government, in collaboration with international development and human rights organizations, has made great strides toward equality. Federal, state, and local initiatives have helped ameliorate the historical gaps in resource access, education, employment, and health that have kept many women and girls from realizing their potential. Yet, women and girls continue to face daunting challenges in the 21st century.

—Cari Maes

teaching women about their political rights through training seminars and empowering them to run for public office (Berger 2006, 35–37).

Women's issues and interest groups often have some affiliation to and representation within formal political parties in state and national elections; yet, few women ascend to party leadership or become candidates for public office. To raise female representation and increase gender equity in political participation more generally, the government has partnered with UN Women and the Political Organization of Mayan Women (MOLOJ) and others to initiate training sessions and manuals for female candidates, voter registration campaigns, and multilingual radio ads encouraging voting (UN Women 2015).

Religious and Cultural Roles

Guatemala comprises a rich, multidimensional religious and cultural landscape, and it is one that illustrates both continuity and rupture with the country's precolonial past. Today, Guatemalans practice a variety of religions, some of which are syncretic, blending the cosmovisions and rituals of indigenous spiritual traditions with those

of Christianity. Indigenous Mayans follow religious tradition rooted in the *Popol Vuh*, a cosmological text recorded during the Post-Classic K'iche' era (900–1500 CE). Mayan religion centralizes the concept of complementarity (male-female, good-evil, day-night) as a mode of explaining and ordering the universe and society. This ideology created more equal roles between genders in precontact Mayan society and blurred the distinctions between the categories *male* and *female*. However, this more egalitarian and gender-fluid social structure would be overturned and replaced by a patriarchal, gender binary social order following Spanish contact in the 16th century.

Under Spanish colonial rule (1524–1821), led by the Franciscan Order, authorities attempted to organize disparate communities into unified towns to impose Catholicism and eradicate indigenous religious traditions. Some indigenous groups acculturated to this imposition by adopting aspects of Christianity, while others defended their ancient beliefs by resisting religious indoctrination. Some suggest that Mayan peoples strategically acculturated to survive culturally and spiritually in an oppressive colonial system. Following independence from Spain in 1821, many indigenous communities retreated from Catholicism and instead

Women in Resistance in Guatemala

Since the CIA-backed coup in Guatemala in 1954, the country has suffered a history of racism, poverty, and oppression. During the 1980s, 200,000 were killed during the internal armed conflict, and 44,000 were disappeared. The legacy of the coup and the genocide remain in today's social inequality in Guatemala. Despite oppressive conditions and the danger of violence, many women are struggling to create a more equitable Guatemala that honors everyone's human rights.

For example, Lolita Chávez, an indigenous Maya K'iche' woman, cofounded the K'iche' People's Council (CPK) to support people's land rights against American and Canadian corporations who want to take the land for hydroelectric dams. Despite threats and violence, Lolita works to maintain the rights of the people to live on the land their people have inhabited for thousands of years.

Angelica Choc is an indigenous woman who is an outspoken critic of nickel mining in Guatemala. Her husband, Adolpho Ich, was murdered when he intervened on behalf of protestors who were being forcibly removed. Now, Angelica has filed a lawsuit against the mining company in Canada for its complicity in the death of her husband.

Lorena Cabnal is an indigenous Xinka woman and cofounder of the Association of Indigenous Women of Santa María Xalapán. The group works to confront violence against women and connects efforts to reclaim the land and to reclaim women's bodies as their own. Lorena calls herself a "community feminist," a feminist focused on her community rather than only on individual rights.

These three women represent an extensive network of women in Guatemala who are resisting oppression and struggling for justice and peace.

—Cari Maes

As the nation modernized and defined itself, Mayan peoples continued to practice the rituals of their ancestors and integrated ideologies and practices from Western religions, particularly Catholicism and Protestantism.

Protestantism first took hold in the late 19th century, as governing elites hoped to follow the imagined path to economic development modeled by other Protestant countries, such as the United States. Protestant missionaries then began attracting small numbers of indigenous Guatemalans in the early 20th century; however, Protestantism became more widespread beginning in the 1960s (Garrard-Burnett 2004, 142). During the late 20th century, Protestantism, particularly Pentecostalism, surged as mass conversions swept the country's interior highland and attracted about 40 percent of the total population. The conversion to Protestantism does not always entail the rejection of traditional indigenous beliefs and customs. Rather, many indigenous individuals find that Protestant churches permit their traditional practices to coexist with Christianity. Some Mayan *evangélicos*, or Evangelicals, view themselves as cultural and spiritual interlocutors between the Protestant faith and indigenous communities and see conversion as a means of revitalization after centuries of oppression (Garrard-Burnett 2004, 145).

Guatemala represents an intriguing nexus of cultures, ethnicities, languages, and religions. While the federal government does not record religious affiliation in its official census, the Roman Catholic Episcopal Conference of Guatemala estimates that 65–70 percent of the population is Catholic. In 2012, the Evangelical Alliance estimated that 43 percent of the population is Protestant (U.S. Department of State 2012, 1). The rise of Protestantism has allowed for the expansion of women's roles in public life following *La Violencia* (1960–1996). Protestant churches and associations have provided educational opportunities, particularly for rural indigenous women who do not have access to state-sponsored schools.

Women have also been able to take on leadership roles in Protestant churches, where they have historically been excluded from doing so as Catholics. Protestant churches encourage women to take active roles within the church and in proselytizing efforts. As such, these churches offer women a social outlet. Some women also benefit from the moralizing efforts of the church. Pentecostal churches, for example, also strictly enforce abstaining from alcohol and drug abuse. Churches can also provide a vigilant social network that can offer protection for female members against domestic violence and abuse. These same communities

defined their national belonging using ethnicity instead of religion (Sullivan-González 1998, 3). In the century following independence, religion and culture became contested concepts with which both liberal and conservative governments attempted to define Guatemalan national identity.

often provide resources for women and children as survivors of these crimes as well. Finally, Evangelical churches provide women, particularly those within indigenous communities, the opportunity to voice their past and present experiences of trauma and suffering through the practice of *testimonios* (testimonials).

Guatemala has a multifaceted cultural landscape that mirrors the diversity of its population. In the country's central highlands, Mayan and non-Mayan indigenous communities retain the languages and cultural ways of their ancestors. Garifuna peoples, descendants of former slaves who inhabit the Caribbean coastal region, embody a mixture of West and Central African, indigenous Carib, and European cultures. Mixed-heritage *ladinos* express the cultural identities of their Spanish and indigenous ancestry. Despite the devastating effects of colonialism, enduring neocolonialism, and decades of civil war, Guatemalan culture has remained vibrant.

During the drafting of the 1996 Peace Accords, Guatemala's Pan-Mayan Movement lobbied for the inclusion of measures to formally recognize and defend ethnic and cultural pluralism as well as to specifically address the historical marginalization of non-*ladino* peoples—the Garifuna, Mayan, and Xinca. In 1995, the Accord on Identity and the Rights of Indigenous Peoples outlined the terms by which the federal government, its UN partners, and local communities would construct an inclusive cultural patrimony (Warren 1998, 7).

The Pan-Mayan Movement, formed in the 1980s, has continued to galvanize multiculturalism, cultural and linguistic preservation, human rights, and education at the grassroots level. Guatemala's Ministry of Culture has likewise taken steps to recognize and conserve forms of “intangible culture,” such as culinary arts, dance, folklore, literature, rituals, song, and both plastic and visual arts. The ministry has adopted a series of formal declarations since 2002 that seek to protect, preserve, and disseminate these forms of indigenous cultural expression (Ministério de Cultura 2015). In recent years, Guatemalan women have taken active roles in initiatives that aim to inventory and preserve cultural heritage. Members of Association of Garifuna Women of Guatemala (ASOMUGAGUA), founded in 1997, seek to empower Garifuna and non-Garifuna women through educational outreach and organizing cultural events.

Guatemalan women, young and old, have played key roles in shaping both national and regional cultures. In the postconflict period, women utilized artistic expression

as a mode of healing. Artists such as Paula Nicho Cumez have gained international acclaim for the powerful messages of resilience evoked in painting, weaving, music, performance, poetry, and literature. Women have created spaces for the dissemination of culture, including the use of radio as a vehicle to reach remote and multilingual populations. Music and songwriting have also flourished as important modes of cultural expression, especially among young women. Feminist rapper Rebeca Lane uses her microphone to speak out against gender inequality, violence against women, and poverty. Her voice and messages speak to women across Guatemala and Latin America as she fuses artistic expression and female empowerment.

Issues

LGBTQ Rights

Among these pressing challenges is the continued suppression of LGBTQ rights as well as a general lack of visibility for members of the LGBTQ community. In 2016, Sandra Moran, a feminist activist and musician and the nation's first openly gay member of Congress, took office; she embodies political and social change. Her position in the federal government gives voice to a larger movement across the nation that seeks to halt violence and marginalization suffered by nonheterosexual and gender nonconforming individuals. This violence, often ignored or even perpetuated by authorities, has drawn the attention of international human rights organizations in the early 2000s (HRW 2006). Spaces of visibility remain few for LGBTQ women and girls; however, there are some notable advocacy initiatives and programs that bring attention to LGBTQ issues and expression. An annual gay pride parade brings allies and advocates to the capital each year, and dozens of organizations, some with transnational links, continue to push for more recognition and specific policy changes in the areas of health, human rights, and civic protection.

Migration

In addition to the economic and social problems created by male out-migration since the late 20th century, the number of women and girls migrating has increased dramatically. Push factors that impel women and girls to migrate include lack of employment opportunities, family instability, political unrest, and violence. In 2013, Guatemala reported the second-highest rate of femicide in the

Figure 2 Percentage of National-Level Approval of Same-Sex Marriage in Central America

Source: Dinorah Azpuru. 2015. "The Political Culture of Democracy in Guatemala and the Americas." *Americas Barometer*: 204.

world. As a result, women represented 50 percent of all migrants leaving Guatemala that year (GHRC 2014). The vast majority, some 95 percent, of the unaccompanied minors entering the United States, for example, are from Mexico or the Central American nations of El Salvador, Guatemala, and Honduras (Kennedy 2014, 1). Since 2009, the number of unaccompanied child migrants from Guatemala arriving in the United States has risen from 1,115 to 18,913, the highest number of migrants among its Central American neighbors, including Mexico (USBP 2016).

Guatemalan children from the rural highlands often do not speak Spanish, the unofficial *lingua franca* in U.S. immigration services and courts. In 2013, the U.S. Department of Justice reported that K'iche', one of Guatemala's 21 indigenous languages, was in the top 25 most used languages in the immigration court system (DOJ 2014). Among the most serious problems associated with youth migration are the threats of violence and exploitation during and after the journey. Some children become victims of human trafficking, while others are injured, sexually exploited, or killed on either side of the border. Unaccompanied young women and girl migrants face a high risk of sexual assault.

Guatemalan officials have worked in conjunction with U.S. agencies and international human rights groups to raise its capacity to forestall the migration of young

women and girls and to build channels to reintegrate those who are deported back to their communities. For example, the community group Centro Quédate (Stay Here) offers former migrants the opportunity to educate others in their communities about the perils of irregular migration and facilitates dialogues about how to improve youths' lives (IOM 2015a). In 2015, Guatemala's Social Welfare Secretariat established a system of shelters to house unaccompanied minors who are returned by U.S. immigration agencies. The shelters provide basic services for returned migrant children and allow them to reconnect with family when possible (IOM 2015b).

La Violencia

During *La Violencia* (1960–1996), women and girls, particularly in indigenous regions, became targets of the state-sponsored kidnappings, murder, rape, and torture. Although fewer women than men were killed during the war—about 15 percent of the total death toll were women (estimated to be 180,000 deaths)—women were the primary victims of torture and rape at the hands of military and paramilitary forces (Carey and Torres 2010, 156). Indigenous women were killed at twice the rate of nonindigenous women during *La Violencia*, and an estimated 90

percent of all rape victims were Mayan women (Carey and Torres 2010, 156–157).

Guatemalan women from all lifestyles have formulated unique approaches to healing and to the restoration of human rights. Activists, artists, and performers have created multiple forums that have shed light on women's experiences of violence and healing over the past several decades. For example, the performing group Las Poderosas (The Powerful Ones) has toured Guatemala and Latin America, bringing the issue of gender-based violence to the forefront. Their performances focus on the ideas of transformation and healing. In 2010, Guatemala convened a Tribunal de Conciencia (Truth Commission) that provided a forum for women to share *testimonios* of the violence they suffered during the 36-year civil war. The event, executed as a symbolic trial, aimed to expose the role of the state and military in cases of sexual and gender-based violence during *La Violencia* as part of a prolonged nationwide healing process. The overarching goal of this forum and similar acts of healing is to focus on women's surviving and thriving rather than victimhood.

One of the unintended consequences of the post-Civil War focus on human rights and democracy has been a slow evolution of activism and political reform around issues of gender inequality. In 2010 the federal government laid out a strategic plan as part of its larger millennium development agenda, which addressed gender inequality and included language that identified the intersectionality between gender, race and ethnicity, language, and religion. Additionally, it identified violence against women and political exclusion as two main concerns facing Guatemalan women at the millennium (ECOSOC 2010).

Guyana

Overview of Country

Guyana ("Land of Many Waters") is located along the Atlantic Coast in northern South America. It is situated between Suriname, Venezuela, and Brazil. Guyana, formerly British Guiana, is roughly 133,575 square miles (214,969 sq. km), with Mount Roraima being the highest elevation point (CIA 2014). Guyana is divided into three counties: Essequibo, Demerara, and Berbice. Guyana's 2015 population was estimated at 767,000. The majority of residents live along the coast, including in the capital city, Georgetown. The remaining population lives in small cities and villages, sometimes called *hinterlands*, scattered throughout the country's rich rain forest and vast interior.

Originally inhabited by indigenous Carib and Arawak tribes, Guyana became a 17th-century Dutch colony and was subsequently held as a slave-holding British colony by 1815. The country obtained independence in 1966 and remains the only English-speaking nation in South America. Guyana's colonial history continues to affect persistent ethnocultural divisions and national politics. Secondary languages include Guyanese Creole; Amerindian languages, including Arawak, Waio, and Carib; and Indian dialects of Hindi, such as Caribbean Hindustani. Constituent religions include a majority of Protestants, including Pentecostals, Anglicans, Seventh-day Adventists, and Methodists; Hindus; Roman Catholics; Muslims; and Jehovah's Witnesses (CIA 2014).

The emancipation of enslaved Africans led to their departure from colonial plantations and, for many, a resettlement into urban areas. Thereafter, laborers from Portugal, China, and eventually, indentured servants from India were imported to work on sugar estates. In the aftermath of decolonization, a legacy of racially polarizing politics emerged, resulting in a turbulent political atmosphere. Since independence, Guyana has largely been ruled by socialist-oriented governments, and the first "free and fair" election took place in 1992.

Today, the two largest ethnic groups are Indo-Guyanese, descendants of 240,000 East Indian indentured laborers imported to work colonial sugar plantations between 1838 and 1917, and Afro-Guyanese, descendants of enslaved Africans. Minority groups include mixed-race *douglas*, indigenous Amerindians (broadly grouped into coastal and interior tribes), as well as descendants of Portuguese and Chinese laborers (CIA 2014). Ethnic tensions between the majority ethnic groups have historically shaped political parties and influenced voting in Guyana. Tensions between the two largest ethnic groups in Guyana (African and Indian Guyanese), which emerged from British colonial rule (Mars 2009), have become politicized and have resulted in periods of party dominance. From 1964 to 1992, state-led discrimination has included unequal access to employment, dominance of the country's police and military by Afro-Guyanese, and widespread violence toward Indian Guyanese between 1963 and 1964 (McLoughlin 2015), which has been described as "near genocidal warfare" (Mars 2001).

Overview of Women's Lives

In 2014, Guyana ranked 121st on the Gender Inequality Index (GII, 0.524), which measures maternal mortality, birth rates, labor force participation, education, and seats in parliament held by women (UNDP 2014). Guyana has maintained slow but steady progress toward various Millennium Development Goals, including hunger reduction, increased access to social services, improved enrollment, completion of primary school, and empowerment of women. Guyana has a relatively progressive legal framework that prohibits discrimination based on gender, race, disability, language, social status, religion, or national origin. Yet, gender inequalities within the family and economy persist due to inadequate social services and weak infrastructures that engender high levels of female out-migration as a survival strategy; increasing

rates of maternal malnutrition and subsequent infant mortality; high levels of female unemployment; and few jobs for women in the marginalized informal sector (Trotz 2004). In addition, Guyanese women have also had to cope with structural and economic violence. The *Gender Gap Report* (2014), which measures national benchmarks on economic, political, education, and health-based criteria, ranks Guyana 64th out of 142 countries with a score of 0.701.

According to the Bureau of Democracy, Human Rights and Labor (U.S. Department of State 2015a), Guyana faces various human rights abuse issues, including government corruption, sexual and domestic violence against women, abuse of minors, and discriminatory laws against lesbian, gay, bisexual, and transgender (LGBT) persons. While the lives of women and girls have steadily improved, they continue to struggle to attain social, economic, and political equality.

Girls and Teens

Guyana has a widespread problem of physical and sexual abuse of children. Law enforcement officials and nongovernmental organizations (NGOs) state that most child rape and child abuse cases are largely unreported. The Child Care and Protection Agency operates a hotline for suspected abuse and received more than 4,000 calls in 2012 attributed to neglect, sexual and physical abuse, verbal abuse, child custody, teenage pregnancy, and delinquency (U.S. Department of State 2015a). Corporal punishment is prevalent in school systems, even at the kindergarten level, with various nonprofits and media outlets pushing for alternative forms of discipline.

Boys and girls can legally get married at age 16 with their parents' consent; at age 18, marriage is allowed without parental consent (U.S. Department of State 2015a). While there has been a decrease in child marriages in recent years, in 23 percent of marriages, the bride was under 18 years old (UNICEF 2013).

While there are reports of child prostitution, Guyana is not considered a destination for child sex tourism. There are no legal prohibitions regarding child pornography; however, regulations for selling or publishing pornography exist. The Tackling Child Labor through Education Project, in collaboration with the Ministry of Labor, Human Services, and Social Security, has garnered social protection for young women. Girls from the isolated hinterland and coastal communities are vulnerable to

exploitation, and efforts have been made to create public awareness and provide more support for victims.

Guyanese law prohibits the employment of minors under age 15, though child labor is prevalent in family-based businesses such as farms and bars and restaurants. They are also domestic workers and street vendors. Local NGOs report that prostitution and forced domestic servitude are the most egregious types of child labor.

Education

There are four levels of education: nursery, primary, secondary, and postsecondary. Guyana has 1,273 schools, 386 preschools, and 426 primary and secondary schools, along with 322 secondary departments located in primary schools (Devnet 2010). It has 21 prevocational institutions along with 1 teacher training college and 1 university. There are also 11 special education and 5 private schools (Merrill 1992). As of 1998, there were approximately 9,500 teachers in Guyana, of which 2,066 were male and 7,405 female.

The *Gender Gap Report* (2014) notes that Guyana has obtained parity for educational attainment with literacy rates, and enrollment in primary, secondary, and tertiary education is equal for both girls and boys. According to Guyana's minister of education, Priya Manickchand, compulsory education is provided free of cost until the age of 15. It is universal at the primary level due to incremental expenditures and incentives that encourage school attendance. A 2014 UN Commission on the Status of Women address noted that females tend to outperform male counterparts up to the tertiary level, hindering gender equality. Males outnumber females in technical and vocational areas, while females cluster into traditionally female academic areas. Programs have been implemented by the Ministry of Education in Guyana to encourage girls to enter nontraditional areas and provide support for vulnerable girls, including reintegration of teenage mothers into training programs.

Role models in the form of female teachers at primary and secondary institutions, large numbers of single female-headed households, and expanding educational opportunities for girls have negatively affected boys' achievements. However, other social inequalities such as class, socioeconomic status, race, and ethnic inequalities in rural and urban environments contribute to disproportionate educational achievements for both boys and girls (Reddock 2010).

At 92 percent, Guyana has a high literacy rate (CIA 2014); however, functional literacy is low due to the poor quality of education, inadequate teacher training, deficient infrastructures, and unavailability of vital resources (Jennings 2000). A lack of functional literacy skills has caused lower employability and socioeconomic disadvantages. To counter this, the government and nonprofit organizations have created initiatives to encourage education as a tool to reduce poverty, as one-third of the population lives below the poverty line, with indigenous Amerindians disproportionately affected (CIA 2014). Guyana has a relatively high ranking in education among developing nations and is ranked 121st worldwide (UNDP 2014). The country has also achieved one of the Millennium Development Goals of universal primary education, though access to secondary education remains a barrier for many citizens due to poverty, limited basic resources, and regional inadequacies, especially for isolated indigenous communities.

Among ethnic groups, Afro-Guyanese have historically viewed education as a means to escape plantation labor, and schoolteachers have been viewed as important figures within village life. Additionally, parental sacrifice to ensure education for children led to overall literacy improvements in villages. Until the 1930s, many Indo-Guyanese families employed as plantation workers resisted sending their children to primary school to protect them from possible discrimination and the influence of a Christian education. Playing on these families' concerns, planters discouraged them from sending their children to school due to the loss of income from the children's labor. By the 1940s, views changed, and successful Indo-Guyanese rice producers believed education was an opportunity rather than a problem, leading to increased enrollment in elementary and secondary schools. Once parental attitudes shifted, schools were built in predominantly Indo-Guyanese sugar estate areas.

All of Guyana's indigenous communities have primary schools. As of 2012, 13 schools enrolled over 5,500 students. The Guyanese government supports secondary schools for the indigenous community. Eight secondary schools in the interior hinterland regions serve approximately 800 Amerindian students, and government scholarships were given to 300 students to attend secondary school in Georgetown. Untrained Amerindian teachers in the interior along with schoolteachers from outside of the local communities create conflict between the academic environment and indigenous traditions and values. Minority Rights International Group (2015) notes that the

nationally standardized educational curriculum erodes important cultural characteristics of the Amerindian lifestyle, including their language, history, sustainable environmental practices, knowledge of medicine, and other skills that are pertinent to the development of the indigenous community.

According to the World Health Organization (WHO), significant progress has been made in Guyana toward improving access to and the quality of primary education. The Indigenous Peoples' Commission and the Women and Gender Equality Commission have implemented various school support programs in the hinterlands under the Guyana National Plan of Initiatives of the Ministry of Education, including training and outreach programs, resulting in improvements in primary, secondary, and university education for indigenous women. Inadequately trained and unqualified teachers declined by more than 40 percent, an improvement from 1992 when it was 60 percent (Merrill 1992; WHO 2013). Moreover, community-based school meal programs have benefited more than 14,000 children in 84 of 138 schools (Bundy 2011). Despite these improvements in the hinterlands, barriers to accessing education outside of the capital city persist.

Health

Access to Health Care

Out-migration of skilled health care workers and educated professionals has resulted in deprivations throughout the medical sector. For example, an international exodus of nurses has affected maternal access and childbirth rates. Despite this, men and women have the same access to health care services overall, including treatment for sexually transmitted infections such as HIV/AIDS. Additionally, government programs have contributed to training and supporting health care workers to staff clinical facilities in remote indigenous communities.

Maternal Health

The government has identified Millennium Development Goal 5: Improve Maternal Health as a 2015 priority to improve the standards and sustainability of maternal health care (UNDP 2014). International out-migration of midwives and nurses has substantially affected maternal health care, resulting in a scarcity of professionally trained medical workers as well as a weakening of the overall delivery of adequate services (Anderson and Isaacs 2007).

Reproductive rights, access to contraception, and postpartum care are widely available; yet, quality of care varies across the country. The UN Population Fund (UNFPA) reported that 43 percent of women under the age of 49 use modern methods of contraception; that as of 2010, there are 280 deaths per 100,000 births; and that skilled health care professionals attend 87 percent of births (UNFPA 2012). Recent media reports in 2014 and 2015 have highlighted a rising maternal mortality rate. Severe bleeding postchildbirth, hypertensive disorders, and neglectful inaction by nurses have culminated in patient illness and death. In addition, Guyana also faces increasing rates of maternal malnutrition and rising infant mortality rates linked to poor facilities that lack appropriate fetal- and blood-monitoring equipment and have a shortage of specialists, including local doctors, nurses, and district midwives.

Diseases and Disorders

Guyana has a high rate of HIV/AIDS. International programs support HIV treatment and prevention (CIA 2014). According to UN Women, HIV-positive women comprise more than half of the population above age 15 and continue to face widespread stigma and discrimination. Stigma hinders women from disclosing their status to husbands, increasing the chances of mother-to-child transmissions. Challenges linked to stigma include access to services, medication, and malnutrition. Organizations such as the YWCA Guyana and the Sunshine Project offer transportation, food, medication, and education for women. The Pan American Health Organization (PAHO) also provides training to health care workers on HIV prevention and responding to the needs of women living with HIV/AIDS. According to UN Women (2000), there are also 183 sites across the country that offer the Prevention of Mother to Child Transmission services before, during, and after delivery. As a result, only 2 percent of babies are born HIV-positive. Recent studies indicate that Guyanese mining communities have a higher HIV prevalence than the general population (Seguy et al. 2008).

Guyana has a very high risk for major infectious diseases, including food and waterborne illnesses such as hepatitis A and typhoid fever, as well as vector-borne diseases, such as dengue fever and malaria. The Guyanese government has created training programs for health workers and “Health Huts” in many indigenous communities in the interior that offer basic services. Lacking adequate

medical equipment and electricity, regional hospitals in the interior are unable to offer advanced medical care. Many hinterland communities rely on outdoor sources of contaminated potable water due to the gold and bauxite mining industries, which increases infections, waterborne illnesses, and skin problems (Minority Rights 2015).

Employment

While Guyana has reached gender parity among professional and technical workers, women’s economic and labor force participation, wage equality, earned income, and equity among senior official or managerial positions remains low. Overall, female labor force participation is about half that of men. Women are typically involved in traditionally female spheres, such as domestic work (World Bank 1994). Even though men outnumber women (CIA 2014), women are more often heads of households and, due to limited job opportunities, more often live in poverty. High unemployment rates among women are also linked to geographic location, as more hinterland women live in dire poverty in comparison to urban and rural women. Rural women tend to work in the agriculture industry as laborers, while city dwellers are employed in low-wage public service jobs. Both the public and private sectors report that skilled workers are in short supply. There is minimal data regarding disabled women.

The constitution, the Termination of Employment and Severance Pay Act, and the Prevention of Discrimination Act protect women workers from discrimination or disciplinary action while pregnancy and after childbirth. The National Insurance Act provides for 13 weeks of maternity leave and benefits paid up to 70 percent (ILO 2016). Further ensuring protection, Guyana is a signee to the Equal Remuneration and Convention on Discrimination that prohibits gender discrimination. In 2015, Guyana’s minister of social protection, Volda Lawrence, promoted additional benefits of paternity leave and supports for women to breastfeed at work (*Stabroek News* 2015).

Guyana’s Constitution addresses equal pay and labor rights for women in politics, economics, and in society. Discrimination based on gender is illegal. Women’s rights, including equal opportunities for academic, vocational, and professional training, in employment, for promotion, and for remuneration are outlined in the law. However, one report on labor standards indicates that filing discrimination complaints is ineffective (ITUC 2009). There is also no mandatory provision for maternity health care,

and there has been little to no recourse regarding sexual harassment. Job openings routinely specify gender preferences of potential candidates, thereby maintaining male- or female-dominated fields that uphold gender divisions throughout the country. ITUC (2009) also reports that informal workers, primarily women and children, are paid below the minimum wage.

Guyanese women have engaged in high levels of out-migration as a strategic means of survival in the face of their increasing unemployment and lack of jobs in sectors where they are marginalized (Trotz 2004). As a result, remittances largely support Guyana's economy. Women who are employed occupy significant roles as farmers, market vendors, teachers, nurses, civil servants, and clerks. Traditionally female-oriented jobs also persist; education data show that women dominate teaching positions across all educational levels.

Discrimination and Income Disparity

Gender-related discrimination persists, despite women and men having equivalent legal status and rights. Guyana's Prevention of Discrimination Act prohibits sexual harassment and gender discrimination, but it lacks enforcement. As of 2012, women continue to be underemployed, receive unequal pay, and face disadvantages in relation to promotions. The Women's Affairs Bureau of the Ministry of Labor monitors women's legal rights in employment-related services and provides professional development focused on leadership and gender-equity issues. The Women and Gender Equality Commission focuses on issues that affect women's advancement to promote engaging in dialogues with regional representatives, government officials, and residents to effectively plan and implement national policy. Barriers to education also contribute to female unemployment.

Family Life

Family life is a central aspect of Guyanese culture, with extended kinship networks playing a major role in the overall sustenance of family structures. Guyanese families generally maintain a patriarchal hierarchy; males possess more power, and females are expected to care for the home and children. This can vary by ethnic group, and there are additional distinctions between major ethnic groups linked to culture, history, and family organization.

Among the Amerindian population, extensive acculturation had occurred by the 1990s as a combined result

of missionary work and intermarriage to Afro-Guyanese. Modern Amerindian culture is similar to Afro-Guyanese and Indo-Guyanese lifestyles (Merrill 1992).

Even though slavery initially forbade marriage among slaves, Afro-Guyanese sustained relationships between men, women, and children. The nuclear family structure, Christian church weddings, and idealism associated with the middle class are now upheld by Afro-Guyanese. Common-law marriages are also socially recognized. Household compositions vary. Either mothers or fathers can be the head of the home, which may include children from several different parental lineages. Afro-Guyanese households tend to cluster around the women, as men may leave home for paid work. Children born to unmarried parents are not stigmatized.

The plantation system and indentureship influenced Indo-Guyanese family life. Prior to migration, East Indians lived in large extended families with caste position dictating future mates. Plantation housing affected households, caste held less importance, and female spouses were in short supply in newly colonized British Guyana (Merrill 1992).

For Hindu Indo-Guyanese, marriage is a rite of passage that affirms social prestige and is considered an important ritual, similar to Muslim weddings. Parents play a role in mate selection, as does religion and sect. The Indo-Guyanese family follows male lineage. While extended family members live in a separate home, it may be close by. Young couples tend to live with the husband's family for several years before establishing their own home. Women's roles in Indo-Guyanese family structures are seen as more subordinate than Afro-Guyanese households (Merrill 1992).

Women's property rights are generally protected in common-law marriages. Guyanese women are entitled to one-half of the couple's property upon separation or divorce if she held regular employment during the marriage. Alternatively, a woman is entitled to one-third of the property if she was unemployed during the duration of the marriage.

In 1996, the Domestic Violence Law was passed; yet, social beliefs persist surrounding the endemic nature of violence against women. While domestic violence legislation served to provide aid to victims of violence, including practical programs that provided shelter, support, and training in life and income-generating skills, challenges surrounding violence against women persist. The government supports efforts, including the "Stamp It Out" campaign to end sexual violence and abuse against women and girls. Structural

adjustments, including living arrangements and other issues, influence how Afro-Guyanese, Indo-Guyanese, and Amerindian women respond to gendered violence. Rape (including spousal rape) and domestic violence are criminalized; yet, many incidents go unreported to law enforcement and are seldom prosecuted by authorities. Both stigma and retribution of further violence persists (U.S. Department of State 2015a). Survivors frequently do not pursue charges due to discontent with the courts and inadequate sentences.

LGBTQ life is restricted in various ways (Sexual Rights Initiative 2014) because Guyana has no antidiscrimination legislation protecting citizens from discrimination based on sexual orientation, gender identity, or gender performance. Further, consensual male same-sex activity is punishable with a prison sentence and local NGO activists report that police frequently intimidate men perceived to be gay. There are no laws regarding lesbian women. Societal discrimination surrounding transgender individuals exists, and public cross-dressing is a criminal offense under Guyanese law. Local organizations report widespread discrimination based on sexual orientation, including fear of reporting crimes within the LGBTQ community because reporting crimes can result in charges being brought against victims for their gender identity or sexual orientation. According to Human Rights Watch (HRW 2009), several activist organizations, including Caribbean Forum for Liberation of Genders and Sexualities, Global Rights, Guyana Rainbow Foundation, International Gay and Lesbian Human Rights Commission, and the Society against Sexual Orientation Discrimination (SASOD), work to repeal discriminatory laws criminalizing basic rights. SASOD also supports LGBT youth 16 years and older.

Politics

According to the *Gender Gap Report* (2014), Guyana is ranked 83rd out of 142 countries in relation to women occupying legislative and senior official status in the country. In terms of overall political empowerment, women in Parliament and ministerial positions continue to be low. Guyana has had one female head of state since independence—American-born Janet Jagan. The Representation of the Peoples Act stipulates that women should comprise at least 33 percent of a political party's slate of candidates (Government of the Republic of Guyana 2014). Guyana has taken measures to foster women's increased participation in public life and in decision-making processes, such as

serving as prime minister, head of the judiciary, and other influential positions, including the first female colonel in the Caribbean. Women's representation in Parliament has grown to 31 percent; 21 of the 65 members are women. Historically, both Indo-Guyanese and Afro-Guyanese women have been susceptible to political ethnic violence in the aftermath of racially divisive elections, including sexual assaults that occurred during civil unrest in 1997 and 2001 (Trotz 2004; World Bank 1994).

Lacking child care facilities, meeting times, lack of training to manage political campaigns, and other inadequacies based on gender, such as inferior access to postprimary education by Amerindian women, ethnic polarization, and the confrontational nature of local politics have each contributed to the overall political gender inequality (UN Women 2000). Guyana's economic decline and systemic poverty has also disproportionately affected women who lack the financial resources needed to participate in political activities.

Since 1964, women's voting participation in elections has increased, and four general elections have resulted in female parliamentarians and cabinet ministers. In 1946, Janet Jagan and Winifred Gaskin jointly established the Women's Political and Economic Organization, whose aim is to ensure political organization and education of Guyanese women. Janet Jagan went on to cofound the People's Progressive Party with her husband, Cheddi Jagan (former president of Guyana and considered to be the "Father of the Nation"), winning elections in 1953, 1957, and 1961. In addition to serving as the first woman head of state, Jagan has served as a parliamentarian, cabinet minister, and executive president (Merrill 1992).

Historically, the number of seats their party wins in elections has determined Guyanese women's representation in Parliament, and increases over the years have been minimal. Equality outlined in the constitution has done little to change the status quo, and women face similar challenges to political participation observed globally; however, these circumstances are exacerbated by dire economic circumstances and patriarchal political culture. Men continue to dominate the economic and political spheres, reinforcing divisions of labor.

Religious and Cultural Roles

The dominant religions are Christian denominations, about 30 percent in total; Hinduism, approximately 29 percent; and Islam, 7 percent. The majority of Indo-Guyanese are Hindu, with a minority of Muslims and a small population

of Christian converts. Some Indo-Guyanese have converted for professional reasons, while others partake in Hindu or Muslim rituals or Christian services. Most Afro-Guyanese are Christian, though some practice Hinduism or Islam.

Because of colonization, Guyana's dominant value system relies on Christianity; Hinduism and Islam were later accepted as Indian indentured laborers arrived. Folk beliefs such as obeah, of African origin, are also practiced. Obeah practitioners can be members of any ethnic group. They are consulted for help with one's love life, health, work, or home life.

Although traditional Amerindian religious beliefs are dissimilar, the importance of a shaman is shared. Six interior indigenous tribes (Akawaio, Arekuna, Makushi, Patamona, Waiwai, and Wapisiana) have undergone extensive acculturation and have some common cultural traits with the Afro-Guyanese and Indo-Guyanese (Merrill 1992).

The role of women in families is based on ethnic and religious identity and varies across groups. Afro-Guyanese households tend to be female-headed with multiple generations of women residing together. Indo-Guyanese households are generally the opposite. They have patriarchal structures that maintain men as heads of household. Overall, women's roles in Indo-Guyanese families are expected to be subordinate, tending to the home and children.

Issues

Indigenous Amerindians

Guyana law protects the rights of the Amerindian indigenous community and members to contribute to decisions affecting land and resources. The indigenous population as of 2002 is around 9 percent of the total population and consists of nine tribal groups. Over 90 percent of Amerindians reside in Guyana's remote interior (two tribes live on the coast) in contrast to the majority population, which resides along the Atlantic coastal area (Minority Rights 2015).

Indigenous communities have a lower standard of living than most Guyanese citizens due to limited access to education and health care. Women and girls in indigenous communities may experience discrimination based on their gender, ethnicity, or economic status.

Border Disputes

According to the IBRU Boundary and Security Bulletin, colonial legacies regarding land and maritime boundary disputes between Guyana, Venezuela, and Suriname

persist and continue to impact economic development (Hoyle 2001). While Venezuela claims up to 40 percent of Guyana's terrain (known as Essequibo), the recent discovery of oil off the Guyanese coast has caused Venezuela to expand its maritime boundaries and bolster its military forces (Connett 2015). Guyana also faces inland disputes with Suriname over the southeastern corner of the country, the New River Triangle territory (an area of land about 6,000 square miles, or approximately the size of Jamaica). Suriname has also claimed the entire Corentyne River and made additional claims to parts of Guyana's sea space (Ministry of External Affairs of Guyana 1969). Historically, maritime disputes have resulted in Guyana's favor, as there has never been a clear boundary between it and Suriname.

Trafficking

Guyana is both a source and destination country for men, women, and children victimized by sex trafficking and forced labor. For children, forced labor occurs in the mining, agricultural, forestry, and domestic service industries. According to the *Trafficking in Persons Report* (2015), both Guyanese and foreign women and girls from other South American and Caribbean countries (including Venezuela, Suriname, Brazil, and the Dominican Republic) are forced into prostitution. Children and women in mining communities in the interior and urban areas are considered at high risk for being trafficked (U.S. Department of State 2015). Under the guise of prospective employment, poor indigenous women are at an increased risk of being groomed into prostitution in Guyana's interior mining and lumber camps and then often face debt bondage, abuse, and enslavement (Minority Rights 2015).

Guyana is making efforts to comply with global minimum standards to eliminate trafficking by protecting and assisting victims and implementing an authority-operated hotline for those victimized. The government of Guyana has been criticized for failing to increase its efforts to hold sex traffickers accountable with jail time and for fostering an environment that enables human trafficking and endangering future victims. The Caribbean Basin Security Initiative and the U.S. government via the *Trafficking in Persons Report* have worked to combat transnational crimes, including human trafficking.

International Community and HIV/AIDS

The United States also works with Guyana to prevent and treat HIV/AIDS. Through the President's Emergency Plan

for AIDS Relief, the U.S. Agency for International Development (USAID) and the Centers for Disease Control and Prevention (CDC) provide education programs to address prevention and treatment for those affected by and infected with HIV/AIDS. U.S. military, medical, and engineering teams have also conducted training in Guyana to improve infrastructure, including digging wells and building schools and health care clinics while also providing medical treatment to improve overall living conditions.

Poverty

Guyana has a very high emigration rate, with over 55 percent of its citizens residing abroad (CIA 2014). About one-third of the Guyanese population lives below the poverty line, and indigenous Amerindians are disproportionately affected by poverty. Poverty is high across ethnic groups; yet, is the most significant among Amerindians (World Bank 1994).

By providing assistance to single mothers, the Guyanese government underscores the importance of women's economic empowerment as a way to enhance their lives and eradicate poverty. Current initiatives promote skill acquisition, the provision of resources to establish microenterprises, capacity-building workshops to enhance entrepreneurial capabilities, and trade fairs. In 2010, Guyana launched the Women of Worth Program for single female-headed households for commercial loans and credit to establish or expand business ventures.

Rural poverty, hunger, and development targeted toward women have led to legal rights to land, access to financial services, and technology improvements. Guyana has worked toward appointing gender representatives in various regions of the country to support rural women's organizations, including working with the Ministry of Agriculture, the Ministry of Amerindian Affairs, and the Women's Affairs Bureau to promote strategies for agricultural diversification, income generation, and distribution of resources. Multiple nonprofit organizations work to address women's issues, including the S4 Foundation, Women across Differences, Help and Shelter, Red Thread, the Guyana Women Miners Organization, and SASOD.

H

Haiti

Overview of Country

Haiti occupies the western one-third of the island of Hispaniola between the Caribbean Sea and the North Atlantic Ocean. After Christopher Columbus discovered Hispaniola in 1492, the Taíno native inhabitants were virtually annihilated through violence and the introduction of disease by the Spanish settlers who followed. In the early 1600s, France established a presence on Hispaniola, and in 1697, Spain ceded the area to them, which became Haiti. The French colony (then known as Saint Dominique) became one of the wealthiest in the Caribbean due to rich forestry, coffee, indigo, cotton, and sugar industries; however, these led to considerable environmental degradation and heavy trading of enslaved Africans.

Between 1791 and 1804, Toussiant Breda (also known as Toussaint L'Ouverture or the Black Napoleon) led a slave rebellion inspired by the 1789 French Revolution. Breda's rebels defeated French and British forces in numerous battles, and the rebellion spread to the neighboring Spanish colony of Santo Domingo (now the Dominican Republic). Breda abolished slavery in both colonies and declared himself governor-general for life in 1801. In response, about 43,000 French troops were dispatched to restore French rule and slavery. Breda was captured and died in prison in 1803, but his rebels ultimately defeated the French later

that year. On January 1, 1804, Haiti declared its independence, becoming the first black republic in the world (CIA 2016; Sutherland 2015).

Haiti is roughly 17,400 square miles (28,000 sq. km) of rough, mountainous terrain and is bordered on the west by the Dominican Republic. It has a tropical climate and lies in a hurricane belt that makes it subject to severe storms June–October (CIA 2016). Clearing land for agriculture and fuel has caused extensive deforestation; in 1988, only 2 percent of the land had tree cover (Haggerty 1989). Deforestation has led to soil erosion, desertification, and droughts; the country now lacks sufficient supplies of potable water. In January 2010, a massive magnitude 7.0 earthquake struck; its epicenter was near the capital city of Port-au-Prince. More than 300,000 people were killed, about as many were injured, and 1.5 million were left homeless. The earthquake was the worst in this region in more than two centuries (CIA 2016). The country remains in acute economic crisis due to increased poverty, crime, food insecurity, and unemployment (PotoFi 2012).

Haiti has two official languages, French and Creole. The population is about 10 million and is growing at 1.17 percent; 95 percent of the population is black, and the remaining 5 percent are mulatto or white. Port-au-Prince has about 2.4 million inhabitants; almost 60 percent of the total population lives in urban areas. More than half of the population (55%) is under the age of 25; the median age is 22.5 (CIA 2016). In 2014, Haiti was ranked 138th out

of 188 nations by the UN Gender Inequality Index (GII) (UNDP 2015). Currently, Haiti is the poorest country in the Western Hemisphere, having experienced political instability for most of its history (CIA 2016).

Girls and Teens

Haitian girls face numerous challenges, many exacerbated by the 2010 earthquake and the economic and social crises that followed. Many girls suffer from poverty, violence, sexual violence, underage pregnancy, human trafficking, and child labor. Limited educational and employment opportunities diminish the freedoms and flexibility of girls and women, often leaving them powerless to improve their situations or become economically independent.

Postquake “Gender Aftershocks”

Women and girls experienced “gender aftershocks” after the 2010 earthquake: a tripling of the pregnancy rate, increased reports of rape, and increased reports of transactional sex and prostitution. These trends were seen countrywide, but they were strongly associated with internally displaced person (IDP) camps established after the earthquake (UNFPA 2011; Amnesty International 2011; HRW 2011). A considerable percentage of teen pregnancies are linked to rape and postquake entry into prostitution. Postquake, 60 percent of reported rape cases involved minors. Out of 981 pregnant adolescent girls, 64 percent reported becoming pregnant due to rape. About 30 percent of girls did not seek health services after being raped; of those who did, most only had access to a nurse, not a physician. Around 40 percent of rape victims received no postrape counseling; some IDP camps had no social or health services available. Of the 60 percent who received counseling, much of it was informal, from family, friends, midwives, herbalists, or *vodouists*. Out of 1,251 pregnant girls, 37 percent reported trading sex for shelter and food. More than 90 percent of pregnant girls reported having no income, employment, clean water, or food (PotoFi 2012).

Reproductive health and family planning services were insufficient before the earthquake and are nonexistent in some areas postquake. Due to increases of rape and transactional sex, some experts are concerned that many women and girls are seeking dangerous abortions. Abortion is illegal in Haiti, carrying stiff penalties for anyone seeking or performing one; however, 43 percent of 843 girls interviewed who became pregnant from rape

reported wanting to end the pregnancy. Only 143 girls reported attempting to end the pregnancy using either pills or herbs (PotoFi 2012). Family planning services exist for only 52 percent of married or in-union Haitian girls aged 15–19: “Not even half of the demand for family planning among married or in-union girls” is satisfied (Oso-timehin 2013, para. 4). Haitian girls likely began entering marriages or unions at a younger age due to pregnancy or the economic crisis caused by the earthquake. This has led experts to suggest that “a generation of Haitian girls was losing its future as a result of rape and its consequences: unwanted, early pregnancies, rumored abortions, school dropouts, increased selling of sex, and mental health problems including depression, post-trauma, and attempted suicide” (PotoFi 2012, 3).

Child Labor

In 2014, 34.4 percent of children ages 5–14 were working, up from 21 percent in 2006 (CIA 2016; USDL 2014). Parents that are unable to provide for their children send them to orphanages or to live with other families, who are expected to provide food, shelter, and education in exchange for work. Some children receive these benefits, but many become domestic workers (*restavèks*) and can be victims of labor exploitation and abuse. Approximately 225,000 Haitian 5- to 17-year-olds are *restavèks*; 80 percent are girls. On average, *restavèks* work 10–14 hours a day unpaid. They are typically underfed; an average 15-year-old *restavèk* weighs 44 pounds (20 kg) less and is 1.5 inches (4 cm) shorter than a non-*restavèk* (Adwar 2014). The large numbers of unaccompanied minors in IDP camps are particularly vulnerable to forced labor or trafficking (HRW 2011).

Haiti was downgraded to Tier III status in the U.S. State Department’s 2016 report on human trafficking. This indicates that Haiti neither complies with minimum standards in prevention and response, nor has significant progress to come into compliance been made (Schaaf 2016). Children are trafficked internally and to the Dominican Republic. Children crossing the border illegally are often accompanied by adults who are paid to pretend to be their guardians. Some children are reunited with relatives in the Dominican Republic; others are illegally recruited by employers.

Many Haitian births are unregistered, and the earthquake destroyed much of the official identity documentation. Identification documents are required to enter into

employment, gain access to the justice system, and receive social services. The lack of identifying documents and a minimum employment age makes protecting children against labor violations difficult.

Additionally, children often cannot access social and educational services. In 2014, Haiti adopted an antitrafficking law that criminalized human trafficking; however, no prosecutions have occurred (Adwar 2014). Additionally, Haiti ratified several UN protocols concerning child protection (USDL 2014). Advocates recommended that Haiti heighten legal and legislative actions and resources against those responsible for child servitude and trafficking. They also recommend training for police, prosecutors, judges, and diplomatic personnel who deal with issues of child servitude and trafficking; nongovernmental organizations (NGOs) could provide valuable resources and expertise in such areas, and Haiti could benefit from such partnerships. The Haitian government should endeavor to educate the public about children's rights to education and freedom from slavery to combat societal tolerance of child domestic servitude. Such efforts should be one of several aimed at addressing the vulnerabilities that lead to child domestic servitude in the first place (Schaaf 2016).

Education

Haitian education lacks the quality and access required for sustained social and economic development. The large number of school-age children compared to the total population places a significant strain on the educational system (Theirworld 2016). In 2011, Haiti initiated free universal education. Despite recent government efforts, challenges in funding, teacher training, and access remain. There are insufficient public schools, and many teachers lack official credentials (HRW 2011; USAID 2016a). The earthquake damaged or destroyed about 4,000 schools, causing a prolonged interruption in education for about 2.5 million children. Currently, about 200,000 children do not attend school, especially in rural areas. Out-of-school children are at risk of child labor or trafficking (USDL 2014).

Preprimary and Primary Education

Preschool is not compulsory, and only 23 percent of children under the age of six have access. Most preschools are private and expensive, making them prohibitive to most families. Primary school is compulsory for children 6–11 years old and consists of three cycles of three years each. Primary school enrollment has improved; prior to 2010,

only about 50 percent of children attended primary school compared to roughly 75 percent in 2016. Enrollment varies by location and is at 68 percent in the northeast compared to 86 percent in Port-au-Prince. About 145 school districts lack a public school. An average Haitian adult has less than five years of schooling. Many children drop out before completing basic education; only 50 percent of children who start first grade complete grade six.

Haiti has one of the shortest school days in the world. Officially, there are less than five hours of school per day, and in practice frequently less; only about 57 percent of possible school days per year actually occur (Theirworld 2016). High dropout and low enrollment rates are due to economic hardships, high repetition rates, and linguistic barriers; they are not reflective of a disinterest or disregard for education (Luzincourt and Gulbrandson 2010).

Haiti's education needs are only 15 percent funded, and just 10 percent of total public spending went to education in 2010, compared to 22 percent in the mid-1990s. While the constitution guarantees a free primary education, most schools charge fees for books, uniforms, and attendance. School fees are prohibitively expensive for low-income families, the majority of Haiti's population. About 85 percent of schools are privately managed. They receive minimal government oversight and are expensive (USAID 2016). Fourteen percent of schools have a library; this drops to 8 percent in rural areas. About 75 percent of schools lack electricity, and 59 percent lack water. These conditions reduce the quality of teaching and learning, reducing the chances that families will send their children, particularly girls, to school (Theirworld 2016). On average, Haitian girls attend school until the age of seven, when they are often pulled out to assist with household chores or to save tuition (WomenOne 2015). Some families have resorted to making children take turns going to school, essentially sharing one education across multiple children (Luzincourt and Gulbrandson 2010).

The overall literacy rate in 2015 was 60.7 percent. This was higher in men (64.3%) than women (57.3%) (CIA 2016). In some areas, 76 percent, 49 percent, and 29 percent of first, second, and third graders, respectively, could not read a single word of Creole. Pass rates in the final year of primary school are 30.5 percent in French, 69 percent in mathematics, and 78 percent in Creole. Such poor academic outcomes are related to the shortage of qualified teachers. Half of public-sector teachers lack basic qualifications, and 80 percent have not received any preservice training. Less than 12 percent of primary school teachers

have completed all of their education and training (Theirworld 2016). Many schools utilize outdated curricula and lack materials, proper management, and organization. In addition, linguistic barriers exist. While most Haitians speak Creole, French, the principal written and administrative language, is the language of instruction. French is the language of the upper class, so not providing instruction in Creole discriminates against students from a low socioeconomic class (Luzincourt and Gulbrandson 2010).

Secondary, Vocational, and Higher Education

Students who complete primary school are awarded a Brevet élémentaire du Premier Cycle (BEPC). Only 29 percent of students complete the BEPC and go on to upper secondary school; 75 percent of these children attend private schools, which charge fees. About 90.5 percent of secondary schools are private, and 78 percent are located in urban areas. Upper secondary studies offer academic and vocational tracks. All tracks are three years and culminate with an examination leading to the Baccalauréat required for admission to postsecondary education (SPANTRAN 2015). Only 22.4 percent of adult women have reached a secondary or higher level of education, compared to 35.2 percent of males (UNDP 2015).

Students can choose to begin vocational training rather than complete the BEPC. Vocational options include technical education, professional education, housework skills, and professional training. Programs last 3–4 years. About 40 programs exist, and half are private. As of 2011, about 21,000 students took vocational training. Around 50 institutions offer secondary technical education, but only 4 are public. About 140 family centers offer two- to three-year programs in clothing, cooking, and housework. Most students are adult women, and there is no age restriction. Located in elementary schools, most operate in poor conditions with almost no equipment. Over 200 private institutions, covering 24 occupations, offer professional training to students who have completed 10–11 years of education or to current workers wishing to acquire new skills.

Haiti has 4 regional public universities and 4 additional public institutions, each associated with their respective ministries, and about 200 private institutions (80% in Port-au-Prince). Public and private institutions require fees. The State University of Haiti, located in Port-au-Prince, is the largest with about 10,000 students. Between 100,000 and 180,000 students are enrolled in

higher education. University resources and facility shortages have been exacerbated by various government efforts to control or censor student activities. Such conflicts have resulted in mass demonstrations, university closings, and property destruction (Luzincourt and Gulbrandson 2010).

Health

“Haiti reports some of the world’s worst health indicators; these numbers reflect a reality, which continues to inhibit citizens’ full participation in the development of a prosperous and stable nation” (USAID 2016b, 1). The already weak health system was further debilitated by the 2010 earthquake, which destroyed 50 health centers, two-thirds of the main teaching hospital, and the Ministry of Health. Months later, the health system was further taxed by a cholera outbreak.

Access to Health Care

Haiti lacks a coordinated health care system. Existing facilities are inadequate, and medical staff, support staff, equipment, and treatment options are insufficient (Ekine 2013). About 40 percent of Haitians lack access to essential health services. Overall life expectancy is 63.5 years: 62 years for men and 65 years for women. Only 45 percent of two-year-olds are fully vaccinated. In 2012, 11.6 percent of children under five years old were underweight; in 2016, 22 percent were reported as “stunted.” Attracting and retaining qualified health professionals is challenging; there are about 4 health professionals per 10,000 people. In 2007, there were only 1.3 hospital beds per 1,000 people. Public health care expenditure is the lowest in the Western Hemisphere, 9–10 percent of the gross domestic product (GDP), resulting in heavy reliance on foreign aid (CIA 2016; USAID 2016b).

Maternal Health

In 2015, the maternal mortality rate was 380 deaths per 100,000 live births, a decrease since 2008. The mean maternal age at first birth is 22.7 years, a decrease since 2012. The total fertility rate is 2.69 children born per woman; the adolescent fertility rate is 42 per 1,000 live births. The 2012 contraceptive prevalence rate was 34.5 percent. Infant mortality is 48 deaths per 1,000 live births overall: 52 deaths for males and 44 deaths for females (CIA 2016; UNDP 2015).

Adequate resources to educate and provide care for pregnant women are lacking. For varying reasons, Haitian

women die from obstetric-related complications more often than those in any developed country (Fischer 2016). Most births occur at home; yet, there is only one midwife per 1,000 births (UNFPA 2014; Mellgard 2015). Most post-natal deaths occur because women delay seeking treatment or do not have access to a treatment center. Many treatment centers lack necessary resources or skilled health care professionals. Pregnant women are at risk of death due to AIDS and intestinal infections (Fischer 2016). The leading causes of infant mortality include acute diarrheal disease, intestinal infectious diseases, perinatal infections, malnutrition, and acute respiratory infections (WHO and PAHO 2010).

Several folk diagnoses pose risks to pregnant women and new mothers. For a month after giving birth, mother and baby remain secluded, and women close to the mother provide for her needs. *Vodouists* believe this prevents rapid disequilibrium of the mother's body, which can be passed to the baby, resulting in tetanus or diarrhea. *Vodouists* also believe that distress, fright, or negative emotions can cause the mother's milk to spoil, resulting in diarrhea or skin rashes. Milk spoilage can lead to milk thickening, which is thought to cause maternal depression and impetigo in the infant (WHO and PAHO 2010). Many Haitians also believe in *pèdisyon* (perdition), a condition in which it is believed that a woman can remain pregnant longer than normal, from 10 months up to several years. *Vodouists* believe a priest or priestess can use magic to divert uterine blood from a fetus, leaving it in a state of arrested development. Once cured, gestation is believed to resume.

Some health professionals view this as an erroneous folk diagnosis used to explain infertility. Women are not considered adults until becoming mothers, and infertility can result in lack of economic support from a conjugal partner, making *pèdisyon* a practical solution for some women (Coreil et al. 1996). Others feel that the belief may stem from the large proportion of women affected by arrested pregnancy syndrome, a recognized psychosomatic condition, which can develop after repetitive miscarriages. Fetomaternal Rhesus incompatibility often leads to miscarriage and is common in Haiti; yet, it is often undiagnosed and untreated (Moise 2015).

Diseases and Disorders

Haiti has the highest incidence of HIV/AIDS outside of Africa. The epidemic began in the early 1980s due to sex tourism and inadequate health education. After introduction,

the virus rapidly spread, particularly among women. Since 1985, heterosexual intercourse has been the dominant mode of transmission. The prevalence rate for adult HIV/AIDS in 2014 was 1.93 percent, a decrease since the mid-1990s, when it peaked at 8 percent in Port-au-Prince and 4 percent in rural areas. This drop is likely due to the successful international response to the epidemic, which focused on education, prevention, screening, and access to antiretroviral therapy (ART) (Koenig et al. 2010). In 2014, 62,602 Haitians received ART (CDC 2015). HIV remains a concern; annually, 5,000 Haitian babies are born infected with HIV, and AIDS causes about 20 percent of infant deaths and has orphaned 200,000 children (CIA 2016).

Cholera broke out in October 2010, and Haiti experienced its first cholera epidemic in a century. Cholera is an acute diarrheal disease caused by the bacteria *Vibrio cholera*; if left untreated, it can be fatal. Transmission is linked to inadequate sanitation and a lack of clean water. Cholera is treatable through prompt administration of oral rehydration salts; more severe cases require intravenous fluids and antibiotics (WHO 2016). Cholera spread rapidly due to initial misdiagnosis, lack of available treatment, and inadequate medical infrastructure. The ongoing epidemic has affected about 770,000 people (8% of the population), killing around 9,200. It is the largest cholera epidemic in modern history (Knox 2016). The epidemic is likely a direct result of the earthquake and the heavy rains that followed; subsequent heavy rains and natural disasters continue to perpetuate the epidemic. Roughly 2 million people were forced into overcrowded IDP camps, where living conditions were poor; maintaining proper hygiene and accessing clean water and food were impossible for many.

The suspected source of the epidemic is the Artibonite River; Haitian suspicions centered on a UN military base that housed Nepalese peacekeepers. Base neighbors reported that human waste often spilled into the river. DNA fingerprinting of cholera samples from Haitian patients identified the strain as one found in South Asia. Only after intense international pressure did the United Nations investigate the outbreak, concluding that substantial evidence indicated that Nepalese peacekeepers had brought cholera to Haiti. The United Nations is currently being sued by the Boston-based Institute for Justice and Democracy in Haiti on behalf of cholera victims. The group believes the United Nations should be penalized for its role in the epidemic and is asking the United Nations to install a national water and sanitation system throughout Haiti, to pay reparations to victims and families, and

to publicly apologize. The United Nations contends that it has immunity from lawsuits due to international treaties. The plaintiffs contend that the United Nations forfeited its legal immunity when it failed to launch an internal process to adjudicate the plaintiffs' claims (Amnesty International 2015; Knox 2016). In August 2016, the United Nations finally acknowledged that it was at least partially responsible for the cholera outbreak (MacDonald 2016).

Employment

Haiti is a free-market economy in which jobs are scarce and low quality. The 2010 earthquake caused the loss of almost 90,000 jobs (Springer 2011). There is a shortage of skilled labor that resulted in widespread unemployment and underemployment; more than 66 percent of the labor force lack formal employment. Unemployment is particularly high for women and young people. Almost 70 percent of heads of poor households have jobs, compared to 73 percent of those in nonpoor households. Wages are typically insufficient to pull a family out of poverty (Scot and Rodella 2016). About 40 percent of Haitians depend on the agricultural sector, which is vulnerable due to frequent natural disasters and widespread environmental damage. U.S. economic engagement has increased apparel exports and investment; 2015 apparel exports accounted for about 90 percent of Haitian exports and more than 10 percent of GDP (CIA 2016). However, this industry is widely criticized for low pay, poor working conditions, and long shifts. Additionally, many companies are foreign, making it difficult to track compliance with Haiti's labor laws (Springer 2011).

Currently, Haiti is the poorest country in the Western Hemisphere; 80 percent live under the poverty line. The 2010 earthquake inflicted USD\$7.8 billion in damage; 2011 showed some recovery (mainly due to foreign aid), and GDP growth rose to 5.5 percent. However, this growth slowed in 2015 to 2 percent due to political unrest, severe drought, and the depreciation of the national currency. The Haitian government relies on formal international economic assistance for fiscal sustainability; over 20 percent of its annual budget comes from foreign aid or direct budget support (CIA 2016).

Women at Work

Female labor market participation is 60.9 percent, compared to 71 percent for men (UNDP 2015). Urban female unemployment is almost 50 percent, compared to

30 percent for men; rural unemployment is less overall (27%), but the gender gap is just as high as in urban areas. Many "employed" women are truly unpaid family workers. Self-employed individuals are mainly women; however, male-run businesses perform better. Male-run businesses attain 40 percent higher revenues and are 13 percent more likely to rank in the 30 top-performing Haitian businesses (Scot and Rodella 2016).

Rural women mainly work in agriculture, often playing complementary roles with men (partner work). Men are responsible for farming, tilling, and heavy machinery, while women assist with harvesting and weeding. Rural women also take products such as tobacco, produce, and fish to markets for sale, and many are full-time market traders. Traders often specialize in a particular commodity and become *marchann*, traveling and redistributing trade goods to small-scale vendors. Such women have the potential to become economically independent; however, many continue to serve in traditional household and child care roles. Most professionals (doctors, teachers, school administrators, spiritual leaders) are men, although women have made progress, particularly as advanced nurse practitioners, who are exclusively women (Haiti Net 2016).

Haitian law provides for equal working conditions regardless of gender, beliefs, or marital status; however, it does not explicitly prohibit sexual harassment, which is common. There are no laws prohibiting gender discrimination in hiring or ensuring equal pay (World Bank 2016). Women earn over 30 percent less than men after controlling for observable characteristics (Scot and Rodella 2016). Law mandates a minimum 42-day maternity leave with 100 percent pay (World Bank 2016).

Family Life

Nuclear families are typical, although there may be adopted children, young relatives, or elders as well. Haiti is a patriarchal society where men are typically viewed as heads of the households. The husband is considered the homeowner and is expected to plant gardens and tend livestock. Women are traditionally nurturers, handling domestic duties and child care. A faithful woman cannot be expelled from a household and is considered the property manager and decision maker regarding revenue from the sale of produce and household animals. Men enjoy more social freedoms than women, although women of the elite class have equivalent social status to women in developed countries (Advameg 2016; Cook Ross, Inc. 2010).

Familial relationships are highly salient; consequently, Haitian families tend to have strong ties. Elders often help raise grandchildren, and family members are expected to care for their elders; placing aging relatives into nursing homes is not socially acceptable. A Haitian family has a reputation that impacts its status and respect within society; everything that an individual does reflects and weighs upon the family. Children are expected to be well behaved, respectful, and obedient. Ill-mannered children are considered embarrassments to their families. Physical punishment is a typical form of discipline (Cook Ross, Inc. 2010).

Courtship and Marriage

Young Haitians typically do not date until their late teens; however, teenagers are increasingly sexually active. Men initiate dating; women who do so are viewed as immoral. While dating, the man typically visits a woman at her home and becomes familiar with her family. Couples may also go to dance clubs, movies, or other social events. After several years, a proposal is expected. Traditionally, a woman's father is asked for permission, but such practice is lessening. Most parents do not influence dating or marriage anymore. They expect children to choose spouses from respectable families of similar social status (Advameg 2016; Brice Foundation 2016).

The minimum legal age for marriage is 15 for women and 18 for men. Marriage is expected among the elite to middle classes, but less than 40 percent of the poor legally marry. Wedding costs are the responsibility of the groom or his family. There is no bride-price or dowry, although women are expected to bring certain domestic items to the new household. Urban couples usually have a church wedding followed by a reception where guests typically eat, dance, and socialize until late in the evening (Advameg 2016; Brice Foundation 2016).

Early marriage is more common in rural areas than in urban areas. Couples often cohabit and have children until they save enough money for the wedding and reception. Rural or poor couples may enter into common-law arrangements known as *plasaj*. The husband and wife often make an explicit agreement on the roles each will fulfill. Frequently, the husband agrees to cultivate at least one plot of land, while the wife agrees to perform household tasks, including child care, cooking, and cleaning. With or without legal marriage, a union is recognized as complete once a man has provided a home for a woman

and their first child is born. Couples typically live on property belonging to the man's family (Advameg 2016; Brice Foundation 2016).

In some rural areas, polygamy is practiced, and about 10 percent of married Haitian men have multiple wives. Polygamy is illegal but generally recognized and accepted within communities. The women often live with their children in separate households, although they typically acknowledge each other and may cohabit. It is not unusual for married men (particularly if they are wealthy) to have girlfriends and children out of wedlock, a practice attributed to the desire for a son. Women are expected to remain faithful to their husbands. Divorce is rare; however, separation is common, especially once a couple's children are raised. If separation or divorce occurs while children remain at home, they typically live with the mother or move in with other relatives (Advameg 2016; Brice Foundation 2016).

Politics

Haiti is a semipresidential republic and has a multiparty system with a civil law system strongly influenced by Napoleonic Code. There have been 23 versions of the constitution; the latest was adopted March 10, 1987, and was amended in 2012. The chief of state is the president, and the head of government is the prime minister. The president is directly elected by absolute majority popular vote, in two rounds if needed, for a five-year term; the president is eligible for a single nonconsecutive term. Suffrage is universal at age 18. The president appoints the prime minister from the majority party. The prime minister appoints ministers and secretaries of the cabinet, who must be ratified by the legislature. A bicameral legislature consists of the 30-member *le Senat* (Senate) and the 118-member *la Chambre de deputes* (Chamber of Deputies). *Le Senat's* members are directly elected in multiseat constituencies by absolute majority vote, in two rounds if needed; members serve six-year terms. The members of *la Chambre de deputes* are directly elected in single-seat constituencies by absolute majority vote, in two rounds if needed; members serve four-year terms. When the two meet collectively, it is known as *L'Assemblée Nationale* (National Assembly). There are 50 recognized political parties (CIA 2016).

Women's Movement

Haiti's long history of women's activism began in 1792 when Cecile Fatiman, *vodou mambo*, helped lead the ceremony that launched the slave rebellion, which ultimately

led to Haiti's independence from France. Other Haitian women were active in the rebellion, poisoning slave owners, creating subterfuge on plantations, participating in marronage, and escaping from plantations to join rebel fighters (Bell 2010).

Advocacy for women's rights has been traced to 1820, when a group of elite women successfully abolished the law designating all women as minors. The second wave of the Haitian feminist movement began in the 1930s when the Feminine League for Social Action formed. This, and other advocacy groups, won legal and constitutional rights for women, including the right to hold elective offices (other than the presidency) in 1944 and suffrage in 1950, although electoral fraud and political repression denied true, full suffrage for men and women until 1990. These first- and second-wave feminist movements were composed of elites and intellectuals; poor peasant women (the majority) were not included and remained socially disenfranchised (Bell 2010).

During the brutal, repressive dictatorships of François "Papa Doc" Duvalier (president of Haiti 1957–1971) and Jean-Claude "Baby Doc" Duvalier (president of Haiti 1971–1986), all women were denied political freedoms—a huge step back in women's progress. Such a dramatic loss of freedoms spurred the merging of the women's movement with the antidictatorship movement by 1965. The contemporary (third wave) Haitian feminist movement began in 1986, when the three-decade Duvalier regime ended. Today's movement includes women from all social classes. The demotion in women's rights under the Duvaliers placed all women, regardless of social class, on equal political footing, which brought women of all social classes together in the fight for equality and social justice (Bell 2010).

Haitian women continue to experience male opposition to their political participation and organization. Women are sometimes barred from meetings and organizations, prevented from leaving home, or prevented from becoming engaged. More extreme measures, such as assassination, abduction, arrest, torture, and payback or punishment rape, have been utilized to silence and repress women. Women have overcome such barriers by meeting in secret and organizing autonomous groups focused on emphasizing their needs and rights within the larger social and economic justice movements (Bell 2010).

Over the past decade, women's political potential has grown through new partnerships and coalitions. For example, the National Coalition to Advocate the Rights

of Women (CONAP) is a group of 11 feminist organizations. Other coalitions of groups organize to address issues of violence against women or to represent women of low socioeconomic class. Such coalitions have successfully advocated for new laws protecting women from discrimination and violence. Continued lobbying to increase rights for domestic workers, paternal responsibility, and civil and property protections for women in common-law marriages are more recent foci (Bell 2010).

Haitian women lost a great deal of ground covered by these women's movements due to the devastation of the 2010 earthquake. The economic status of the majority, already poor, has been downgraded. The government's already weak ability to enforce women's rights has become almost nonexistent. Gender consciousness—both of men and women—has declined as other needs take priority (Bell 2010). Unfortunately, the earthquake claimed the lives of several notable women's rights advocates and leaders, including Myriam Merlet, Magalie Marcelin, and Anne Marie Coriolon. Merlet, the chief of staff of Haiti's Ministry for Gender and the Rights of Women and an activist author, returned to Haiti to fight for women's rights after having fled the Duvalier reign. She founded Enfofam, an organization that raises awareness about and honors women through media and collecting stories. Marcelin, a lawyer and actress, established Kay Fanm, a women's rights organization that deals with domestic violence, offers services and shelter to women, and makes micro-credit loans available to women entrepreneurs. She and Coriolon served as top advisers to the women's rights ministry. Coriolon founded SOFA, another women's advocacy and services organization. Her activism helped bring rape to the forefront of Haitian courts, where it had traditionally been dismissed as a crime of passion (Ravitz 2010). Without strong activist leaders such as these women, the future of Haiti's feminist movement may see slower or less success.

Women's Quota

In 2011, *L'Assemblée Nationale* approved several constitutional amendments, including Article 17.1, which states, "The principle of quota of at least thirty percent (30 percent) of women is recognized at all levels of national life, especially in public services" (Mika 2015 para.7). Article 30.1.1 of the Electoral Decree requires political parties to introduce measures to enforce this minimum quota for women. Article 92.1 grants a 40 percent reduction in

registration fees for political parties with at least 30 percent female candidates. Article 129 offers a 25 percent increase of state funding in the following electoral campaign to political parties with at least 50 percent female candidates of which half are successfully elected. However, the Electoral Decree does not stipulate penalties for non-compliance, and neither it nor the constitutional quota are enforced.

In 2015, only 8 percent of registered legislative and 9 percent of presidential candidates were women (Mika 2015). In 2016, the United Nations recognized Haiti as one of five countries with no women seated in parliament. Currently, just three women ministers serve in the cabinet, less than 19 percent (iciHaiti.com 2016b). In 2010–2011, former first lady Mirlande Manigat stood for presidential election and reached the second round, where she lost to Michel Martelly (Shaw 2013). In 2011, Martelly proposed subsuming the Ministry of Women's Affairs and Women's Rights (MWAWR) into the Ministry of Social Affairs, but he retracted due to opposition from women's groups. The MWAWR formulates and implements policies to improve gender equality, but it is underfunded (Shaw 2013). Many women work in public service as heads of agencies and in middle to senior management roles; however, key leadership positions are almost exclusively held by men (Lassegue 2012). There have been two female prime ministers. Claudette Werleigh served from 1995 to 1996 (University of San Diego 2016), and Michele Pierre-Louis served from 2008 to 2009 (Shaw 2013).

Religious and Cultural Roles

About 55 percent of Haitians are Roman Catholic, the country's official religion. Almost 30 percent are Protestant, mainly Baptist (15.4%) and Pentecostal (7.9%). Small populations practice Islam, Baha'i, Judaism, Buddhism, and *vodou* (CIA 2016).

Haitian Vodou

Many Haitians incorporate elements of *vodou* into another religion, most often Roman Catholicism. Haitian *vodou* has West African roots and originated during colonial times, when slaves were forcibly converted to Christianity. Because their native religious practices were suppressed, slaves disguised their *loa* (spirits) with Catholic saints (Gordon 2000). Such amalgamation of different religions, cultures, or schools of thought is referred to as *syncretism*.

Due to syncretism between Catholicism and *vodou*, it is difficult to estimate the number of *vodouists* in Haiti; however, it was recognized as an official religion in 2003 (CIA 2016).

Vodouists believe in *Bondye*, the supreme creator, who does not intercede in human affairs; therefore, they directly worship *loa*, spirits subservient to *Bondye*. When *vodou* came into contact with Roman Catholicism, *Bondye* was associated with the Christian God and each *loa* with a particular Catholic saint. Every *loa* is responsible for a particular aspect of life. *Vodouists* cultivate personal relationships with *loa* through offerings, personal altars, devotional objects, and participation in ceremonies involving music, dance, and spirit possession (Brown 2001).

In *vodou*, the soul is dualistic, consisting of the *gros bon ange* (big good angel) and the *ti bon ange* (little good angel). The *gros bon ange* is responsible for basic biological functions, and the *ti bon ange* is the source of personality, character, and willpower. To *vodouists*, the latter is essential for survival of individual identity; however, it is believed unnecessary to keep the body functioning biologically for continued existence. Therefore, cultivating *gros bon ange* is not as vital. *Vodouists* revere death, believing it to be a transition, not an ending. This is why *vodouists* believe that they can continue to commune with ancestors as well as *loa* through ceremonies, offerings, and altars (Thomas 2013).

Houngans (male priests) or *mambos* (female priests) are believed to be chosen by the dead and receive divination from deities while possessed. *Vodou* does not assign particular responsibilities or limitations based on sex; only titles differ. The religion has gender parity. *Houngans* and *mambos* utilize the symbolic *asson*, or rattle, during ceremonies. The *asson* is traditionally held by *houngans* or *mambos*, along with a *clochette*, or bell. Inside of the *asson* are stones and snake vertebrae, and the outside is covered with a netting of porcelain beads (Rigaud 2001).

Ceremonies take place inside a *hounfour*, or *vodou* temple. After one to two days of preparation (i.e., creating altars, ritual cooking), the service begins with prayers and songs, followed by a litany of the saints and *loa* honored by the particular *hounfour*, and then a series of verses for all the main spirits of the house. Afterward, songs for all the individual *loa* are sung. While singing, participants believe spirits visit and possess individuals, speaking and acting through them. Each *loa* is saluted and greeted and provides assistance to those who ask (Kilson and Rotberg 1976). *Vodouists* believe that if all taboos imposed by their

particular *loa* are followed and all offerings and ceremonies are conducted faithfully, the *loa* will aid them. Ignoring one's *loa* can result in sickness, crop failure, death, and other misfortunes (Simpson 1978). Such ceremonies often last throughout the night and may involve animal sacrifice.

Vodou practice is diverse; small details of service and the *loa* served vary between *hounfours*. There is no central authority in Haitian *vodou*; each *mambo* or *houngan* heads her or his own *hounfour*. Within their homes, *vodouists* may have tables set out for ancestors and the *loa*. These typically have a white candle, a glass of water, and flowers, although pictures or statues of *loa*, perfumes, foods, and other items believed favored by *loa* are not uncommon. Cemeteries and crossroads are also meaningful places for worship (Michel 1996).

Vodou is commonly mistakenly associated with Satanism, witchcraft, black magic, zombies, and voodoo dolls. Such misconceptions are perpetuated or exploited by Western popular culture, a practice that stems from a popular myth that the slaves were able to defeat the French during the Haitian Revolution because their *vodou loa* made them invincible through a pact with Satan (Shen 2015).

Issues

In addition to the many social, economic, political, and environmental issues that Haitian society faces, the Haitian LGBT community contends with additional concerns about their status.

LGBT Rights

Adult same-sex activity has been legal since 1986; however, Haiti does not recognize same-sex marriages or civil unions. In 2013, a protest of more than 1,000 Christian and Muslim Haitians occurred in Port-au-Prince. The protest was reported as a response to a proposal to legalize same-sex marriage; yet, no such proposal existed. During the week of the protest, about 50 homosexual men were beaten by armed gangs, but no arrests resulted (Reid-Smith 2013). The constitution does not prohibit discrimination due to sexual orientation or gender identity, and there are no laws that prohibit such discrimination or hate crimes. The constitution does make certain guarantees to all citizens, including a right to health care, housing, education, food, and social security (Republic of Haiti 1987).

LGBT Haitian crime victims are frequently treated poorly by police. Amnesty International (2016) reports that

LGBT rights organizations were permitted to contribute to training new police recruits; however, no similar training was organized for existing officers. Attacks against LGBT people are not uncommon and are typically not investigated (Amnesty International 2016). Justification for such harassment and abuse stems from traditional gendered attitudes and religious mores. Most Haitians have strong ties to a religion that views homosexuality negatively; therefore, LGBT people are often viewed as immoral, and supporting their rights is seen as in opposition to God.

The 2010 earthquake exacerbated the challenges LGBT Haitians already faced. Religious leaders and public opinion blamed the *masisi* (a derogative term for homosexual) and other “sinners” for incurring God's wrath, causing the earthquake. LGBT individuals suffered attacks and harassment due to this widespread belief. Similar attacks occurred against *vodou* practitioners, as a significant number of *vodouists* are believed to be *masisi*. Many Haitian LGBT individuals find it easier to be open about sexuality and gender expression within *vodou* culture, which possesses little discrimination against LGBT people. Discrimination and violence were common in IDP camps. Gay and bisexual men reported the need to affect a more masculine demeanor to avoid harassment, being denied access to emergency housing, health care, or enrollment in food-for-work programs. Lesbian women reported that sexual violence and “corrective” rape were common in IDP camps; the rape of LGBT men and women in or near IDP camps was widely documented (IGLHRC & SEROvie 2011).

Honduras

Overview of Country

Honduras is located in Central America, bordering the Caribbean Sea between Guatemala and Nicaragua and bordering the Gulf of Fonseca (North Pacific Ocean) between El Salvador and Nicaragua. It is 43,278 square miles (112,090 sq. km), consisting of mountains in the interior and narrow coastal plains. It has a population of 8,893,259, and a high percentage of Hondurans live in the two major western cities of San Pedro Sula and Tegucigalpa, the capital city (CIA 2016). Ninety percent of the Honduran population is mestizo, or mixed Amerindian and European descent. The remaining inhabitants are 7 percent Amerindian, 2 percent black, and 1 percent white. Spanish is the nation's official language. Several indigenous Amerindian languages, including Garifuna and Miskita, are also spoken (Westmoreland 2016). There are many indigenous populations: the Lenca, Pech, Tawahka, Xicaque, Maya Chorti, Misquito, and Garifuna. "The Garifuna are of mixed, Afro-Carib origin and were moved to the area during the colonial period. There is also an Afro-Honduran Creole English-speaking minority group of around twenty thousand who live mainly in the Honduran Bay Islands" (Minority Rights 2017).

Honduras was originally inhabited by a Mayan civilization and colonized by the Spanish in the early 1500s. It gained independence in 1821, becoming part of a short-lived confederation of Central American states before

becoming a separate republic in 1838. Modern Honduran history has included military coups, rebellions, and dictatorships since gaining independence from Spain. From the late 1800s through the mid-20th century, U.S. fruit corporations exerted great control over the country. In 1969, during a World Cup soccer match between Honduras and El Salvador, troops from El Salvador invaded Honduras. In reality, the subsequently dubbed “soccer war” was more about land disputes and demographic and immigration issues than a sport rivalry (Westmoreland 2016).

In 1997, Carlos Flores Facussé became president, and soon after, in October 1998, he had to cope with the catastrophic destruction to Honduras brought by Hurricane Mitch. Thousands were killed and many more thousands left homeless when Tegucigalpa was flooded with water levels that reached 10 feet. Landslides covered entire towns, and nearly three-quarters of the country’s crops were destroyed, which had a devastating economic impact. In the aftermath, the United States became the primary source of economic and logistical aid (History 2009). Ricardo (Joest) Maduro came to power in 2002 with intentions of economic and social reform. However, problems in the essential agricultural sector and rising crime caused people to lose faith in the Maduro government.

Manuel Zelaya was inaugurated as the new president in January 2006 (Westmoreland 2016), but he was forced out of office during a coup d’état in June 2009. On November 29, 2009, Porfirio “Pepe” Lobo Sosa was elected president. Although Human Rights Watch has criticized some actions of his presidency, Lobo did hire a human rights adviser, and he organized a truth and reconciliation commission to investigate the coup. Zelaya returned to Honduras in May 2011. In 2013, Juan Orlando Hernández became the president of Honduras (Westmoreland 2016).

Indigenous History

“The current territory of Honduras cuts across what was a pre-Columbian boundary between Mesoamerica and the more dispersed indigenous communities to the south” (Minority Rights 2017). There are now many distinct indigenous descendants. Among these are the Lenca, Maya, Chortí, Mayagna (Sumu), Tolupan (Xicaque), and Pech (Paya), whose original ancestral communities were organized around fishing, agriculture, and trade. These divisions remained largely intact until the arrival of the Spanish in 1540, who in their quest for silver and gold killed tens of thousands and enslaved as many as 150,000

for the mines and as exports to other countries (Minority Rights 2017). The Spanish also brought the first Africans with them as forced labor. The Afro-Honduran Garifuna society developed in 1797. The Afro-Caribbeans who came to Honduras from St. Vincent continued to speak their own language and preserved their own cultural traditions. In the 1840s, a group of English-speaking free black people from the Cayman Islands also migrated to Honduras’s Bay Islands, forming a distinct group that was self-sufficient. They also maintained their own Creole language and Afro-Caribbean culture (Minority Rights 2017).

Hondurans are 97 percent Roman Catholic and 3 percent Protestant. Honduras is the second-poorest country in Latin America, with approximately 65 percent of the population living in poverty and a per capita income that is one of the lowest in the region. The income gap is vast: 60 percent of the national income is earned by the wealthiest 20 percent of the nation, while the poorest 20 percent earn just 2.02 percent of the income (UNHRC 2015). It also has the world’s highest murder rate (CIA 2016).

Overview of Women’s Lives

In 2015, the UN Development Programme ranked Honduras 131st out of 187 nations based on the Gender Inequality Index (GII, 0.48) among other indices (UNDP 2014). According to the UN Human Rights Council’s *Report of the Special Rapporteur on Violence against Women, Its Causes and Consequences*, “Violence against women is widespread and systematic and affects women and girls in numerous ways. A climate of fear, in both the public and private spheres, and a lack of accountability for violations of human rights of women are the norm, despite legislative and institutional developments” (Manjoo 2015, 4).

Girls and Teens

Girls in Honduras rank roughly equally with boys in the educational setting. They have similar literacy, enrollment, dropout, and grade repetition rates. The Education Policy and Data Center included a study of how Honduras compared to other low- and middle-income countries that included two factors: the primary school net enrollment rate and youth literacy. According to these measures, Honduras ranks at the 68th percentile in access to education and at the 50th percentile in learning (EPDC 2014). Many girls do not finish school; the primary school dropout rate is 6 percent for girls. By secondary school, this number had

more than quadrupled to 34 percent of female youth who are out of school (EPDC 2014). This leaves them vulnerable to low-wage work in future.

Education

In Honduras, the overall educational statistics indicate that universal primary education has yet to be achieved, despite being set as one of the important UN Millennium Development Goals. Nevertheless, statistics also indicate that girls outrank boys in many educational indicators, such as enrollment, transition, and literacy rates. The academic year runs from February through November. Children officially enter primary school at age 6, and the primary school cycle lasts for 6 years (ages 6–11). Students then move into the lower secondary cycle, which lasts for 3 years (ages 12–14), followed by the upper secondary cycle, which lasts for 2 years (ages 15–16). According to the 2014 National Education Profile compiled by the Education Policy and Data Center, there were 1,876,000 students enrolled in primary and secondary education, of which 1,217,000 (65%) were enrolled in primary education. Of youth ages 15–24, 2 percent have no formal education, and 16 percent have attained an incomplete primary education at most. In total, 19 percent of 15- to 24-year-olds have not completed primary education in Honduras (EPDC 2014).

Honduras spends 5.9 percent of its GDP on education expenditures. Primary school enrollment is near 100 percent, and the school life expectancy from primary to tertiary education is 11 years; however, the educational quality is poor, the dropout rate and grade repetition remain high, and teacher and school accountability is low (CIA 2016). While primary enrollment levels are at or near 100 percent, this number also reflects the high level of grade repetition and overage that occurs within the primary education system. The enrollment rate drops to 75 percent in lower secondary school, and the number of students who transition to secondary school is only 70 percent for girls (66% for boys). By upper secondary school, the gross enrollment number for girls is 82 percent (60% for boys). Grade repetition and overage is not as high in secondary school as in primary, but it is still a statistical factor (EPDC 2014).

The Education Policy and Data Center tracked the percentage of students who were out of school in Honduras. This was defined as students who were not currently enrolled in any schooling, which indicates what proportion of children are not currently participating in the education

Women's Voices

Maria Alicia Calles

Maria Alicia Calles, despite her limited education, founded the Unión de Mujeres Campesinas Hondureñas (UMCAH) to give rural Honduran women a voice in their communities. UMCAH works for agricultural reform for female and male farmers and seeks equal standing for women. The organization ensures that illiterate rural women understand their rights and works for expanded land rights and political representation so that women can provide for their families and communities.

Calles's activism includes the presidency of Consejo Coordinador de Organizaciones Campesinas de Honduras (COCOCH), the Coordinating Council of Peasant Organizations of Honduras. Calles has said, "We are a vulnerable sector of the world. Because others speak on our behalf, they decide what they think is necessary for us. That is why we are vulnerable" (IFAD 2010).

—Jane Harris

IFAD (International Fund for Agricultural Development). 2010. "Promoting Women's Leadership in Farmers' and Rural Producers' Organizations." Retrieved from <https://www.ifad.org/documents/10180/498cfa01-fbda-410e-b356-df1203cdf976>.

Women Thrive Alliance. 2016. "Maria Alicia Calles." Retrieved from www.womenthrive.org/maria-alicia-calles.

system and thereby missing out on the benefits of school. For primary school-aged girls, the number was 6 percent. By secondary school, this number had more than quadrupled to 34 percent of female youth who are out of school (EPDC 2014). Both in primary and secondary schools, the greatest disparity can be seen along class lines. The poorest children are out of school at exponentially higher rates than the richest children. For example, of the secondary school students who missed school, 62 percent were in the poorest quintile of income versus 10 percent in the richest (EPDC 2014).

Additional measures include the number of times and the number of students that repeat a grade. Students are more likely to repeat first grade in primary education, with a repetition rate of 8.1 percent for girls (10.4% for

boys). The repetition rate drops for each subsequent year of primary school. The average rate across all five grades of primary school is 4.4 percent (EPDC 2014). The dropout rate, defined as the proportion of students enrolled in a given grade in a given year who are no longer enrolled the following school year, is also a concern in primary school. The dropout percentage for girls is 6 percent (7% for boys) (EPDC 2014).

Another indicator of achievement in education is the literacy rate. In a 2015 estimate, the literacy rate (defined as able to read and write at age 15 and over) is 88.6 percent for women (88.4% men) (CIA 2016). UNESCO reported similar literacy rates: 88 percent for both women and men; however, it also provided more complex age analysis. For the youth population, defined as those aged 15–24, 98 percent of girls were literate as of 2015 (96% of boys). For the population 65 years and older, 50 percent of women were literate (54% of men). The study also demonstrated that for the youth population, the literacy rate has increased each of the 8 years a study was recorded since the first in 2001. The illiterate female population (15–24 years old) is recorded as 15,983 as of 2015 (male 33,142) (UNESCO 2016). It also reported that the youth literacy rate (defined as ages 15–24) is 95 percent, which is higher than that in other lower middle-income countries (EPDC 2014).

The Education Policy and Data Center included a study of how Honduras compared to other low- and middle-income countries that included two factors: the primary school net enrollment rate and youth literacy. According to these measures, Honduras ranks at the 68th percentile in access to education and at the 50th percentile in learning. The most recent Progress in International Reading Literacy (PIRLS) test assessment results were administered in 2006 to grade 6 students; it displays “the percentage of test takers that have fallen below the lowest performance levels and the percentage of test takers that have exceeded the highest performance levels in these assessments” (EPDC 2014). When compared to other countries that took the same reading assessment and fell below the lowest benchmark by 13 percent, Honduran test takers fell below by almost double the number, nearly 26 percent (EPDC 2014).

Gangs

According to a 2012 report on the Status of Gangs in Honduras, more than 4,700 Honduran children and young people belong to gangs, including 447 who are incarcerated in

detention centers. Women make up 20 percent of the overall gang population, and of the 4,700 participants in the study who were women, none were in positions of higher authority (UNICEF 2012). Most had joined between 11 and 20 years old. There are numerous motivations for joining: poverty, coercion, lack of opportunities, and a lack of access to public services. Some join out of social exclusion, likening it to a familial experience. “We were adopted,” they say (UNICEF 2012).

If it is a family experience, it is not a safe one. Over 80 percent of gang members reside in two cities: San Pedro Sula (60%) and Tegucigalpa (21%), the capital, some in neighborhoods known as “lawless zones” where there are no police (UNICEF 2012). Young girls are often inducted into gangs, where they are subjected to levels of violence, including rape. They are often pressured to have sex with other gang members or otherwise sexually exploited. They are forced to carry drugs and are routinely killed in acts of vengeance to settle disputes between rival gang members. Girls are subject to torture, mutilation, and decapitation to erase identity (Manjoo 2015). Gangs are responsible for a great deal of overall violence connected to drug trafficking, extortion, and kidnappings. They also contribute to Honduras having the highest homicide rate in the world at 82.1 killings per 100,000 inhabitants (UNICEF 2012).

For girls who are able to leave gangs, few options are available. There is a high level of retaliation from gang members for leaving. If they can, they have limited opportunities due to their lack of education or the lack of rehabilitation services in prisons. Most who were interviewed for the report on the Status of Gangs stated their sole desire as finding a job and stressed the lack of study aids, counseling, and legal advice that could be provided by government rehabilitation services to help them reintegrate into society. Leaving gangs and leading more productive lives would require this assistance in addition to a shift in the cultural stigma of gang affiliation (UNICEF 2012).

Health

Maternal Health

According to a 2016 estimate, the birth rate in Honduras is 22.8 births per 1,000 population, and the mother’s mean age at first birth is 20.4 in a 2011–2012 estimate (CIA 2016). The maternal mortality rate is 129 deaths per 100,000 live births (2015 estimate), placing Honduras at 69th out of 184 for its country comparison. The maternal mortality rate is the annual number of female deaths per

100,000 live births from any cause related to or aggravated by pregnancy or its management (excluding accidental or incidental causes) (CIA 2016).

The infant mortality rate is 17.7 deaths per 1,000 live births (male 20 per 1,000; female 15.2 per 1,000) in a 2016 estimate. The infant mortality rate compares the number of deaths of infants under one year old in a given year per live births in the same year. This rate is often used as an indicator of the level of health in a country. Honduras ranks 96th out of 225 countries in the country comparison ranking (CIA 2016).

The teen pregnancy rate is 24 percent for girls aged 15–19, making it one of the highest rates in Central America. According to a 2012 report, Honduras has 108 live births for every 1,000 women in this age range, and 30 percent of the pregnant population is under 18 years old. Such a high rate of teen pregnancy has potential immediate and long-term implications for both the health and education of teen girls. It contributes to perinatal, infant, and maternal mortality and contributes to the cycle of poverty through the likelihood of increasing lack of attendance and dropout rates at school (USAID 2016).

Maternity Leave

Mothers are legally entitled to six months of maternity leave, and maternity benefits from social insurance are up to 66 percent of previous earnings. They are also required to receive two paid nursing breaks of 30 minutes each when on the job. Two-thirds of maternity leave is paid for by social insurance and one-third by the employer. There is no parental or paternity leave. Pregnant women are legally protected from dismissal while on the job, during maternity leave, and during a period after they return from maternity leave. Employers who have more than 20 female workers are also required to provide nursing or child care facilities at their workplace or a reimbursement for child care costs. Pregnant and breastfeeding workers are also prohibited from performing dangerous or unhealthy work or from working at night, but the law does not provide for any alternative (ILO 2014).

In practice, there is a significant gap between the number of women who actually receive maternity leave and those who are legally eligible for it. In 2013, the share of employed women who were legally covered by statutory maternity leave was 33–65 percent. However, the number of women who benefited from maternity leave, 10–32 percent, demonstrates that implementation of the law often

does not happen, and the number of women who have access to it is significantly lower than those who are legally entitled to it. Furthermore, vulnerable populations of impoverished pregnant women, such as domestic workers and those working in the *maquiladoras*, frequently work long hours, including night shifts, well into their pregnancy. There are no maternity leaves, and once they have given birth, they continue to work without sufficient nursing breaks or child care facilities. Some workers reported being required to take a pregnancy test prior to employment to circumnavigate the law. This may be in part because an employer is responsible for the full payment of maternity leave cash benefits for women who are not covered by social insurance but otherwise qualify for maternity leave. Additionally, women are not legally guaranteed the right to return to the same or an equivalent position after returning from maternity leave (ILO 2014).

Diseases and Disorders

HIV/AIDS

In 2015, there were an estimated 20,000 Hondurans living with HIV/AIDS and 1,000 HIV/AIDS related deaths. Honduras ranks 74th out of 133 countries that are monitored for the adult prevalence rate of HIV/AIDS. This ranking compares the percentage of adults (aged 15–49) living with HIV/AIDS, which in Honduras is 0.37 percent in the 2015 estimate (CIA 2016). The CIA ranks countries comparatively based on the percentage of adults (aged 15–49) living with HIV/AIDS. “The transgender population is the most affected by the HIV epidemic in Latin America, with a prevalence rate of 35 percent. To put an end to the epidemic, it is essential to ensure the fulfillment of human rights as well as access to health services that respect gender identity” (IAA 2012).

Major Infectious Diseases

There is a high risk of food and waterborne diseases, such as bacterial diarrhea, hepatitis A, and typhoid fever. Dengue fever and malaria are the most prevalent vector-borne diseases, and active local transmission of Zika virus by infected mosquitoes has been identified in the country as of August 2016 (CIA 2016).

Employment

In a 2010 estimate, 60 percent of the population lives below the poverty line. The unemployment rate is 4.1 percent

(2015 estimate), but approximately one-third of people are underemployed (CIA 2016). The 2013 estimated GDP was USD\$18.55 billion, making it the second-poorest country in Central America (Manjoo 2015). As of a 2015 estimate, employment is composed primarily of agriculture at 13.9 percent, industry at 26.6 percent, and services at 59.5 percent. Major exports include apparel, coffee, cigars, bananas, fruit, lumber, shrimp, gold, lobster, palm oil, and automobile wire harnesses (CIA 2016).

There is a high overall level of poverty, which is particularly true in female-headed households. Women head approximately 32 percent of households (Manjoo 2015). The Honduran National Statistics Institute indicates that 64 percent of female-headed households are poor (58.8% of male-headed households). Of the 17.6 percent of total households living in extreme poverty, 17.6 percent are headed by single females (9.2% by single males and 73.2% by households of both sexes). There is a greater number of women among the rural poor, and the rates of both unemployment and underemployment are also two-thirds higher for women than for men. In all households, women have fewer employment opportunities and greater food insecurity. Decisions over family resources and family income are more likely to be made by men, and there is an equally significant gender gap in decisions on access to credit (USAID 2016).

Government protections for gender equity have been enacted; however, while there are some legal statutes, much gender inequality still exists. A National Policy on Women and a Second Plan for Equality and Gender Equity (2010–2022) have been adopted by the government to empower women and promote their economic development. Both the Honduran Constitution, in Article 123 (3), and the Labor Code, in Article 367, support the principle of equal pay for equal work for all workers without discrimination. In reality, there is an extremely unequal distribution of income and high levels of income disparity. Women are paid on average 67.6 percent of the wage earned by men and have an unemployment rate that is double that of men, despite having equal literacy levels (Manjoo 2015).

Maquiladoras

Two major industries in which women are employed are in *maquiladoras* (factories) and in domestic work in private homes, both of which are generally less subject to regulation, which puts women at greater risk to a host of issues: low wages, lack of job security, poor working conditions, and possible exploitation and violence (Manjoo 2015).

Maquiladora plants (*maquilas*) often exist in export processing zones (EPZs). As an industry, they employ roughly 125,000 people, 65 percent of whom are women and most of whom are between 17 and 25 years old and from rural areas (Manjoo 2015). When interviewed for the *United Nations Report of the Special Rapporteur on Violence against Women, Its Causes and Consequences*, the women reported a lengthy list of repeated violations of their rights: “verbal and physical abuse by supervisors, sexual harassment, being subjected to pre-employment pregnancy tests, unfair dismissal and discrimination on the grounds of pregnancy, and denial of maternity leave and other social benefits. . . . They often worked long hours without rest. They also witnessed co-workers succumb to chronic fatigue, depression and musculoskeletal disorders as a result of the hazardous working conditions” (Manjoo 2015, 12).

Women working in EPZs also face a lack of benefits because employers often do not contribute to the social security fund. This leaves workers without access to health care rights, including access to maternity leave, while earning a minimum wage that is less than USD\$0.70 per hour—between 28 percent and 51 percent less than the required minimum wage. Social attitudes about gender impact women’s treatment, including unequal pay: “Employers justify lower wages for women with the stereotype that women’s work is less demanding than men’s work” (Manjoo 2015, 12). Women workers in the EPZs face constant monitoring and scrutiny, reportedly are allowed only two timed bathroom breaks per shift, and are unpaid for any overtime work if they have not met the production requirement for their shift. They also face harassment, blacklisting, and firing for any attempt to form unions or organize a protest (Manjoo 2015).

Domestic Work

“Legislation prohibits discrimination in employment based on sex” (ILO 2014). However, many Honduran women work in private households, and like those who work in the *maquilas*, they are at a high risk of exploitation and subject to low pay, long hours, poor treatment, and lack of benefits. Of the approximately 64,000 domestic workers in Honduras, 20,000 are women. Domestic workers are covered by “social legislation” under Article 131 of the Constitution, but in practice, many are denied such protections. This preempts them from health coverage for illness and maternity or allowance for family members,

including the elderly and orphans. As the law also covers lockouts, accidents, unemployment benefits, occupational diseases, and any other contingencies that could impact employability, not having access to it severely impacts the quality of life (Manjoo 2015).

Child Labor

According to a UN report, there is a high level of child labor, defined as children ages 5–14, in Honduras. The 2012 report indicated that 300,000 children are working, with the highest percentage of them (63%) in the agricultural sector. Child labor within indigenous communities was also prevalent, according to the report (Manjoo 2015).

Family Life

Marriage

According to the UN Global Database on Violence against Women, the child marriage rate in Honduras is 34 percent. This statistic is calculated as the percentage of women between 20 and 24 years old who were first married or in a union before the age of 18 (UN Women 2016).

Same-sex marriage is not legal; in fact, since May 2005, the Honduran Constitution explicitly prohibits marriage or a union between people of the same sex (Equaldex 2017).

LGBT Rights

To determine the degree to which Honduras is protective of or a persecutor of homosexual rights, it is important to examine the constitutional protections afforded to gays, whether they have civil or political rights, whether advocacy exists within the country, and the degree of societal persecution that exists. Considering these criteria, Honduras has made significant legal ground in the past few years; however, there is still a high degree of societal persecution. According to Equaldex, homosexuality was legalized for both men and women in 1985. There is housing and employment discrimination protection for both sexual orientation and gender identity. Since February 2013, the penal code (Article 321) was amended to protect LGBT individuals from discrimination, although no implementation of this law has been found. Similarly, homosexuals are not restricted from serving openly in the military, but they do experience harassment. People also have the legal right to change gender, but doing so requires surgery. Conversion therapy is also legal. But

same-sex adoption is not legal in Honduras. All of this suggests an intermediate level of legal rights for LGBTI people (Equaldex 2017).

Queer Advocacy

Regarding advocacy groups, after 15 years of struggle, on August 28, 2004, the Honduran government finally granted legal recognition to three gay, lesbian, and transgender associations, despite significant protests. Legal recognition is a means by which gay, lesbian, and transgender organizations, like other segments of civil society, can acquire and own property, pay salaries, and take part in legal disputes. It also gives such organizations (and their constituencies) a place and face in society as a whole and gives their membership the power to enjoy full status as citizens and full belonging in their communities (Outright 2017).

Politics

In Honduras, *de jure* gender equality and nondiscrimination rule, but there is still a great deal of *de facto* inequality, including in the legal and political spheres. While the constitution establishes equality among the sexes, in practice, women are often relegated to positions that are not fully equal.

2009 Coup

Politically, the coup that occurred on June 28, 2009, further undermined the position of women: “In a historical context of poverty, underdevelopment and citizen insecurity, the 2009 coup further resulted in serious human rights violations being committed” (Manjoo 2015). Manuel Zelaya, the president at the time of the coup, was forced out of the country by military forces under the claim that he planned to organize a poll on the possibility of holding a referendum on constitutional reforms prior to the November 2009 elections. After his exit, the then Speaker of Congress, Roberto Michelitti, was sworn in as the new president of Honduras. These actions were perceived as a military coup by many in the international community, and sanctions and other economic pressure was imposed on Honduras that further negatively impacted a country with a history of poverty. The socioeconomic impact on citizens contributed to and were exacerbated by high levels of violence from organized crime and gang activity (Manjoo 2015).

Coup's Impact on Women

Reports indicate that hundreds of people were brutally repressed by police both during and in the aftermath of the coup and that several women who had been arbitrarily detained were sexually abused. Illegal arrests, kidnappings, torture, and other kinds of intimidation were also reported. "This type of behavior further served to intimidate women into avoiding the public arena, thus affecting women's effective participation in decision-making processes, both in the public and private spheres" (Manjoo 2015). The military and security forces that were also charged with breaking up demonstrations were reported to be violent as well, and reports indicate that more than 10 people died. In addition to the fatalities, there were also women who disappeared, an occurrence that is happening with increasing frequency. The overall rate of disappeared women in 2008 was 91. In 2013, it was 347, a 281 percent increase in the number of women who have simply vanished (Manjoo 2015).

Position of Women in Government

In 2000, for the first time, the Equal Opportunities for Women Act (EOWA) established a minimum 30 percent quota for women with respect to posts filled by popular vote. Women held 3 out of 17 ministerial positions before the government's restructure, and despite the EOWA, in 2001, women represented only 7.1 percent of elected officials in Congress. It was clear that there was non-compliance with the act. To combat this, a reform of the Elections and Political Organizations Act in 2004 made it a mandatory requirement for political parties to comply with the provisions on participation by women. In 2005, women comprised 24.2 percent of the elected candidates, but women's representation in parliament dropped to 19.5 percent in 2009 (Manjoo 2015). This year was not without gains for women, however, as Honduras had its first female chair of parliament in 2009 (WIP 2017).

At no time has the 30 percent quota established in 2000 been achieved. Nevertheless, in April 2012, Congress increased the minimum quota of women candidates from 30 percent to 40 percent for primary elections by approving an amendment to Article 105 of the elections law. The amendment also specified an increase to 50 percent for future election processes (Manjoo 2015).

In the 2013 general elections, women comprised 40.4 percent of candidates for Congress and 20.8 percent of

candidates for mayor. The results indicate a continued gender gap: women were 24.2 percent of the Congress and 6.7 percent of the mayors in local governments. The judiciary demonstrates greater gender equity. Of the 798 judges and magistrates in Honduras, 398 are women. At the highest level, however, gender inequality persists. There are only 3 women of 15 Supreme Court magistrates; however, in September 2010, a gender unit was established within the Supreme Court (Manjoo 2015).

Issues

Violence

According to the UN Global Database on Violence against Women, as of 2014, Honduras has a Gender Inequality Index (GII) rank of 99th out of 152. The Gender Inequality Index reflects inequality between men and women in reproductive health, empowerment (as measured by government seats and educational obtainment), and labor market production. Honduras has a Global Gender Gap Index rank of 80th out of 145 as of 2015. The Gender Gap Index measures gaps in economic, political, education, and health criteria (UN Women 2016).

Rape

In 2006, one of the primary findings of the Committee on the Elimination of Discrimination against Women was the high level of sexual abuse, particularly incest and rape, against women and girls (Manjoo 2015). Reports indicate that such crimes are increasing, growing 21 percent between 2007 and 2011 (USAID 2016). Of the more than 16,000 complaints related to violence against women that the Statistical Observatory of the Office of the Public Prosecutor received in 2012, almost 20 percent of them were for sex crimes (Manjoo 2015). Between 2011 and 2013, the online database of the judiciary indicates that 2,850 cases related to sexual offenses were registered; however, statistics vary. Honduras' Centre for Women's Rights indicates that 2,851 complaints were filed in 2013 alone (Manjoo 2015). The U.S. Agency for International Development reports that, in 2011, women were victims in 81 percent of the sexual violence cases, and 74 percent of sexual violence victims are between the ages of 10 and 19 (USAID 2016).

Domestic Violence

Domestic violence is the leading crime that is reported at the national level. Of women aged 15–49, 27 percent

stated that they had been subjected to physical violence at some point in their lives. The Statistical Observatory of the Office of the Public Prosecutor received more than 16,000 complaints related to violence against women in 2012, with 74.6 percent related to domestic or intrafamily violence. Between 2009 and 2012, 82,547 domestic violence complaints were filed, disproportionately by women. In 2013, for instance, of 19,458 cases, 92 percent were filed by women compared to 8 percent (1,712) filed by men. There are also a small number of convictions: there were only 134 convictions from 4,992 registered complaints during the 2012–2014 time frame (Manjoo 2015).

Femicide

Women are being murdered in Honduras at an alarming and ever-increasing rate. In 2005, 175 women were murdered. The femicide rate jumped a staggering 246 percent to 606 deaths by 2012, and 97 percent of these cases remain unsolved (USAID 2016). According to the *United Nations Report of the Special Rapporteur on Violence against Women*, femicides across many categories in Honduras have steadily risen (Manjoo 2015). In 2012, the 606 cases of femicide is an average of 51 women murdered each month. In 2013, that number had risen to 629 and the femicide rate to 263 percent. While domestic and intrafamily violence were the leading causes of femicide, new causes such as sexual violence, organized crime, and gang-related violence have emerged as contributing to higher numbers of femicides. One in five femicides is linked to domestic violence, while an estimated 7 percent are tied to sexual violence and an overwhelming 60 percent to organized crime. Access to guns was also cited as a contributing factor. Hondurans are allowed to register up to five firearms, and the majority of those are owned by men (Manjoo 2015).

In February 2013, the Honduran Congress amended the chapter of the Criminal Code on homicide to include the offense of femicide, which is applicable when men have carried out killings motivated by hatred and disdain for women. This offense is punishable by 30–40 years' imprisonment and has been on the statute books since April 2013. Since 2011, 203 convictions have been obtained by the Public Prosecution Service of 549 cases that have been brought to trial involving killings of women (UN Women 2016).

Human Trafficking

Honduras is both a source and transit country for men, women, and children, according to the 2011 *Trafficking*

in Persons Report, which showed that the routes used for human trafficking coincided with those identified with other illegal activities, such as weapons, drugs, and organized crime. Honduras ratified a law against human trafficking in 2012, but no national systemic or consistent data exists on prevention, assistance to victims, or the criminal prosecution of perpetrators (USAID 2016).

Honduran Women's Movement

There is no question that an unprecedented level of violence against women exists. Equally troubling is the inability of the justice system to address the problem as well as efforts to suppress those who protest: "The Honduran government is using its institutions to silence people who speak out and to perpetuate violence against women. The judicial system is one of the greatest obstacles to applying international instruments that would protect women" (Ruiz-Navarro 2015). In response to such oppression, there is an active organized women's resistance movement that aims to change the legal and cultural position of women. One of the central groups is Movimiento de Mujeres por la Paz Visitación Padilla (Visitation Padilla Women's Movement for Peace), whose general coordinator for many years was Gladys Lanza, a leader with more than 30 years of political activism in the women's rights movement. In 2012, Lanza explained the purpose of the organization: "We work with women at the political level, at the organizational level. We have at least 5,000 activists in our movement. We are known as 'chonas.' That's become a byword in Honduras for strong, determined women. Many more women support us and will join our demonstrations but it is the 'chonas' who are the bedrock of our movement" (LAB 2012).

CEDAW, the UN entity for gender equality and the empowerment of women, was adopted in 1979 by the UN General Assembly and is described as "an international bill of rights for women [that] defines what constitutes discrimination against women and sets up an agenda for national action to end such discrimination" (UN Women 2009). Its 2016 report on Honduras concluded that there are significant barriers to women's access to the justice system. In the summary, the committee stated concern

about the barriers to women's access to justice, particularly in cases of gender based violence. It is concerned that the lack of independence and impartiality of the justice system is reinforced by insufficient resources,

poor infrastructure, and lack of specialized units and personnel, including police, prosecutors and judges trained on gender issues, resulting in a dysfunctional and corrupt judiciary and an overall culture of impunity. The Committee is also concerned about the lack of proper investigation, evidence collection, and forensic facilities and capacities, causing lengthy delays in legal proceedings and re-victimization of women. It is concerned about women's reluctance to file complaints due to discriminatory attitudes among law enforcement personnel. (CEDAW 2016)

In the face of such enormous barriers to gender justice, the need for change, and the activism to create such change, is immense. Yet opposition to activism is great: since the 2009 coup d'état against President Manuel Zelaya, more than 5,000 Honduran activists have been criminalized, including Gloria Lanza (Torres 2016). For more than 30 years, in the face of vast oppression, including torture, intimidation, death threats, imprisonment, and, in 1991, a bomb that destroyed her home while she was in it, Lanza has been instrumental in human rights defense. Together with Movimiento de Mujeres and other human and women's rights groups, Lanza has fought for women's increased political representation, recognizing that women's position cannot change until women share equal political power (LAB 2012). In 2012, she commented, "We want to get through Congress a law that increases the quota of female politicians from 30% to 50% and makes it obligatory for men and women to alternate in power, that is, if a man gives up an elected office, then he has to be replaced by a woman. And vice versa. We won't succeed in the short term but we'll go on trying" (LAB 2012). Lanza, who died on September 20, 2016, at age 74—at the time still challenging a conviction against her—did not live to see the day of full gender equality, but other activists continue the fight.

Violence against LGBTI People

Of greatest significance for LGBT people is the lack of physical safety. In 2011, Oscar Alvarez, the minister of security of Honduras, announced that he would create a special unit to investigate crimes against journalists, LGBT people, and other vulnerable groups. Members of the security forces and judicial bodies met with the minister of justice and human rights to discuss the creation of this unit, which was composed of approximately 150 security officers who were to investigate the deaths of women,

journalists, youth, members of gay groups, lesbians, and travesties (transvestites), that had previously not been investigated sufficiently (Outright 2017).

To help combat LGBT violence, international organizations also work with local Honduran organizations. According to a November 2013 report, the Irish-based international human rights organization Front Line Defenders said that since the 2009 coup in Honduras, there had been 101 crimes motivated by sexual orientation or gender identity between 2010 and 2012. To help combat such violence, the group created a radio campaign in support of local Honduran LGBTI rights defenders. The campaign consisted of a series of public service announcements (PSAs), short radio spots designed to promote the recognition of LGBTI rights defenders as engaged in legitimate and necessary work to end discrimination and violence and to foster human rights defense. The campaign featured "eight human rights defenders [giving] their testimony to illustrate the reality faced by the LGBTI communities and those working to promote their rights and end violence and discrimination" (ILGA 2013).

According to the Human Rights Watch's (HRW) *World Report 2016: Honduras*, homophobic violence continues to be a major problem. Between 2009 and 2014, the Inter-American Commission on Human Rights (IACHR) received reports of 174 bias-motivated killings of LGBTI people. While the government had set up a special unit in the attorney general's office to investigate and prosecute such killings in August 2013, out of the 42 cases that had been brought to court, only 10 people had been convicted of such crimes by October 2014. According to the HRW report, "Lesbian, gay, bisexual, and transgender individuals are among those most vulnerable to violence. Government efforts to investigate and prosecute violence against members of these groups made little progress in 2015" (HRW 2016).

Most murders remain unsolved, and research shows that transgender individuals are particularly vulnerable: in the cases of 61 murders of LGBTI individuals reported between 2008 and 2011, only 10 people were brought to trial, and none for the death of transgender women, even though they accounted for two-thirds of the cases (IAA 2012).

Transphobia across government structures at every level is facilitating a systematic climate of impunity with regards to human rights violations committed against transgender activists. Such impunity, which manifests itself in a culture of silence leads to a failure

to file complaints, a failure to adopt a differentiated approach when dealing with such cases, ineffectiveness in the justice system, the existence of discriminatory legislation, and the absence of legislation on gender identity. (IAA 2012)

Violations of Rights of Indigenous People

According to the Minority Rights Group International, indigenous people have gained greater legal and cultural acceptance nationally. Nevertheless, there are several key areas that impact their overall well-being and security, particularly in the context of the systemic historical marginalization and lack of social investment in these populations. Each indigenous community is distinct and has unique concerns, but there are key issues that overlap, some of which are intensified by intersections of ethnicity/race and class with gender. For example, Garifuna students more commonly obtain medical training in Cuba because they traditionally have difficulty gaining entry to the medical faculty of the Honduran National University. Additionally, the first hospital built for Garifuna people did not open until August 2008 under the Honduras-ALBA initiative with President Manuel Zelaya Rosales (Minority Rights 2017).

A widespread concern among many indigenous groups is land rights. While many agreements have been reached between the government and indigenous groups, the issue often remains unresolved or contested. Access to landownership is difficult for indigenous people, and this appears especially true when ethnicity intersects with race. Between February and August 2010, 1,487 landownership deeds were issued to farmers, but less than one-third of these were awarded to women. During this period, women were allocated 28.4 percent of the ownership rights for agricultural land. "Some sources argue that women are largely denied access to and control of productive resources and that, in most cases, they are unable to obtain credit to enable them to be successful farmers. This results in their dependency on their husbands or male relatives being reinforced, and renders them vulnerable to violence" (Manjoo 2015).

Indigenous organizations are concerned about international financial organizations such as the World Bank that have funded an initiative called the Program for the Administration of Lands in Honduras (PATH). The concern with PATH is that it encourages individual landownership over the communal landownership that is traditionally practiced by many indigenous communities (Minority Rights 2017).

Not only do indigenous groups have to contend with financial organizations, they also must deal with other landowning interests, such as national tourism organizations. As some of Honduras consists of land that is remote and difficult to access, such as the northern coast that is inhabited by at least four Garifuna communities, it had a pristine coastline that ultimately attracted a tourist industry intent on developing it. To do so, deals were made to change communal Garifuna property to individual plots of land; pressure was then applied to individual families to sell, and as many families were impoverished, the economic pressure succeeded. According to the Minority Rights Group International, these communities "are under unprecedented threat of disappearance" (2017).

In addition to the threat of the loss of a way of life through the disappearance of traditional cultures, many indigenous populations are also under the threat of harassment and physical violence. In response to the loss of land rights, indigenous activists have worked to retain their land and culture. Garifuna leaders, for example, while working to defend communal territory and resources, have had property destroyed by arson. The Prisoners of Conscience, an indigenous group of human rights defenders, is recognized as an at-risk group by international human rights monitors. In some cases, authorities appear unable to properly pursue justice in response to threats and harassment received by land rights activists, even high-level harassment claims that include "fabricated criminal charges against community leaders that include land seizure and murder. In 2008, Amnesty International continued to cite instances of the use of politically motivated criminal charges to detain indigenous people in an effort to 'obstruct the efforts of indigenous leaders to secure recognition of communities' claim to communal land titles'" (Minority Rights 2017).

J

Jamaica

Overview of Country

Jamaica is located 90 miles south of Cuba and 118 miles west of Haiti (Bouchard 2014). The country is approximately 4,182 square miles (10,831 sq. km) and has approximately 221 miles (257 km) of coastline. The Blue Mountains contain the island's highest point. Due to its location between Europe and the Americas, Jamaica was an ideal place for many to conduct business. It served as a trading post for slaves, exports, and natural resources, such as alumina, bauxite, gypsum, and limestone (Meditz and Hanratty 1987; CIA 2016).

Arawak Indians called Jamaica *Xaymaca* (well-watered) (Facts on File 2014). The Arawak Indians, also known as Taínos, who were reportedly from South America, settled Jamaica circa 700 CE. When Christopher Columbus arrived on the island on May 5, 1494, Jamaica underwent another name change; he called it "Santiago," after the Spanish Saint James (Meditz and Hanratty 1987). The Arawak Indians, who were used as slaves, were decimated by harsh living conditions and diseases carried by Europeans (Facts on File 2014). To replace the lost free labor, enslaved Africans were brought to Jamaica in 1517. In the nearly 150 years after the Spanish had occupied Jamaica, Great Britain gained control over the island in 1655. In 1670, the British acquired Jamaica through the Treaty of Madrid. Between

1640 and 1700, approximately 85,000 slaves were imported to Jamaica. By 1700, 250,000 Africans were enslaved on the island. The increase of slaves was in direct proportion to the rise of sugar production. The slave trade ended in 1807. By 1834, Africans were completely free (Meditz and Hanratty 1987). The slaveholders were given 19 pounds for each slave to compensate for the loss of labor (JIS 2016).

In the 1700s, sugar production was at its highest, which accounted for the need for free labor. However, early in the 18th century, sugar prices began to fall. The price-fixing of the crop did not substantially increase its price. By mid-19th century, to improve the fledgling economy, the British Parliament imported plantation workers from India rather than hire the former slaves. By 1865, the plantation system had collapsed, which led to rioting because of widespread poverty and unemployment. One year after the riots, Jamaica became a crown colony. It was ruled by Great Britain, who appointed Sir John Peter Grant as its first governor (JIS 2016).

In the early 20th century, Jamaicans began to demand their right to be self-governing. In 1944, Jamaica established a universal voting rights and constitution, which created a House of Representatives (JIS 2016). In the same year, two political parties were formed, the People's National Party (PNP), led by Norman W. Manley, and the Jamaican Labor Party (JLP), founded by Sir Alexander Bustamante. Fifteen years later, Jamaica became self-governing. In 1962, Jamaica became independent; however, the Queen

of England remained the head of state (Kurian 2016). In 2006, Jamaicans voted for Portia Simpson Miller, their first female prime minister. She was voted back into office by large majority in 2011 (Kurian 2016).

As of 2013, Jamaica's population was 2,717,991 people. In 2014, most Jamaicans were between the ages of 15 and 34, making up 36 percent of the population. Compared to the census of 2001 to 2011, the Jamaican male population increased at a greater rate than the females. The Population and Housing Census section reported that the population of women significantly dropped from 40,538 in 2001 to 28,917 in 2011. Some Jamaican parishes had more females than males: female-dominated parishes included St. Andrew, St. Catherine, and St. James, and male-dominated parishes were St. Ann, Trelawny, Hanover, Westmoreland, St. Elizabeth, Manchester, and Clarendon (STATIN 2014).

At 98 percent, the majority of the population is of African descent. The next largest ethnic groups are mixed-race people of African or European descent (7%). The smaller percentages of ethnic groups are Chinese and Afro-Chinese (0.2%), East Indian and Afro-East Indian (1.3%), and white (0.2%) (Bouchard 2014). A majority of Jamaicans are Protestant (64%). Under the top three sects under the Protestant classification are Seventh-day Adventist (12%), Pentecostal (11%), and Church of God (9%). The largest non-Protestant religions are Roman Catholic (2.2%), Jehovah's Witness (1.9%), and Rastafarian (1.1%) (CIA 2016). Although not numerous, other religions include Muslim (1,500), Hinduism (1,800), Judaism (500), and Baha'i (270) (Bouchard 2014).

Jamaica is steadily working to reduce its debt, which is estimated at USD\$16 billion (130% of GDP) (CIA 2017). This fiscal responsibility is down from 141.6 percent in 2013, when the gross domestic product (GDP) was USD\$14.36 billion and its growth rate measured only at 1.3 percent, while its inflation rate was 9.3. These numbers make Jamaica the slowest-growing economy in the world. Experts attribute the slow economic growth to the high public debt and social problems such as high unemployment and high crime, which affect tourism, one of Jamaica's largest industries (CIA 2017; STATIN 2014).

Overview of Women's Lives

Despite the election of Jamaica's first female prime minister, Portia Simpson Miller, in 2006 (Facts on File 2014), Jamaican women still face many issues, including

inequality in employment, sexual violence, domestic violence, low numbers in the economic and political arenas, and a high rate of adolescent pregnancy as well as low wages. Jamaica ranks 96th out of 187 countries in the Human Development Index (HDI), which is low compared to other Caribbean and Latin American countries. The HDI measures the progress of human development in these areas: the average number of years of education received in a lifetime by people aged 25 years and older and the total number of years of schooling a child of school-entry age can expect to receive if prevailing patterns of specific enrollment rates stay the same throughout the child's life. The last measurement is standard of living. What makes Jamaica's HDI rates low in comparison to other countries in the region are several factors. In the areas of maternal mortality and adolescent birth rate, Jamaica is the second highest in the region. In regard to female participation in Parliament and the labor force, Jamaica is one the lowest (UNDP 2013). One measure of Jamaican women's overall status is reflected in its 2014 Gender Inequality Index (GII) ranking of 93rd out of 188 countries (value of 0.430), placing it in the high human development category. The GII measures how women fare in reproductive health, empowerment, and the labor market (UNDP 2014).

Girls and Teens Sexuality

Jamaica's adolescent fertility rate for 1,000 women between the ages of 15 and 19 is 58 as of 2015, a continuous decline from a high of 210 in 1967 (World Bank 2017). Exacerbating the problem is the mixed messages both genders receive. Boys are expected to express their masculinity through their sexual prowess. They are also expected to be sexually experienced. Girls, however, are strongly encouraged to remain virgins. They are prohibited from expressing their sexuality on any terms (Smith et al. 2003, 45–46). The Catholic Church and church leaders reprimand sexually active teens (Crawford et al. 2011, 163)

Education

Girls make up 49 percent of children aged three to five years old attending early childhood institutions recognized by the Ministry of Education. While at this level, 52 percent of males are enrolled. In the 378 secondary schools, including independent schools, in grades 7–11, 51 percent are female compared to 49 percent male. By the time males reach

secondary education in Jamaica, they enroll at a smaller percentage than when they began school in early childhood. When males reach postsecondary education, their numbers drop dramatically. Jamaica has 7 postsecondary schools with a total enrollment of 44,330 students. Of that number, only 33 percent of males are enrolled. The older girls become, the longer they stay in school compared to their male counterparts (MOE 2014). The mean years for schooling for Jamaicans are 9.7, whereas the expected number of years for schooling is 12.4 years (UNDP 2015).

Literacy

The highest grade that children experience reading problems is at the high school level (Wilks et al. 2007, 31). Males in junior high had great difficulty with reading compared to females in the same group: 45 percent of males had difficulty in reading compared to 25 percent of females. The study demonstrated that adolescent girls outscored males in every aspect of literacy and math: “Males were nearly four times likely to be ‘not literate’ compared with females” (27). Jamaican women’s higher literacy rate shows in the Gender Equity Index (GEI), which measures inequality between men and women in education, the economy, and political empowerment. In the area of education, Jamaica scores 0.97 (Social Watch 2012).

Health

Access to Health Care

Jamaica has 24 hospitals, 5 special institutions, and 348 primary health care centers (WHO 2013). The health care system has public, private, and nongovernmental organizations (NGOs) (MOHE 2007). The health care system has limited specialization care, such as dentists and nurses, and rehabilitation care in speech and occupational therapy. Most prescription drugs are imported, which makes the cost high for Jamaican patients. Despite Ministry of Health (MOH) efforts to combat HIV/AIDs, malaria, and other illnesses, “the prevalence of non-communicable diseases . . . now accounts for more than 50% [sic] of fatal disease outcomes” (WHO 2013).

According to the Ministry of Health’s Web site, the health care system in Jamaica has been decentralized since 1997. In the same year, each region in Jamaica established four health authorities: South East, North East, Southern, and Western. MOH established these facilities to “deliver care to the population” (2008).

A study conducted by Scott and Theodore discovered that providing health care facilities in each region has not resulted in favorable changes for the poorest in Jamaica. In 2004 and 2007, they discovered that age and gender do not factor into whether a person is more likely to be sick or injured. A Jamaican’s income determines whether he or she is likely to be ill or injured and the length of the illness (Scott and Theodore 2013).

Maternal Health

Jamaica’s life expectancy at birth is 72 years old for men, and for women it is 75. The country’s infant mortality rate for children under a year old is 13 per 1,000 live births, while the birth rate is 18 births per 1,000 people (CIA 2017). Jamaican women do not often visit a health care professional while they are pregnant. Ninety-seven percent of pregnant women received antenatal care at least once. Eighty-seven percent of women had made at least four antenatal care visits during their pregnancies. In 2010, the maternal mortality rate was 110 (UNICEF 2012).

Mental Health

Jamaica overall has a low incidence of suicide, based on 2014 World Health Organization data, just 1.22 persons out of 100,00. Of those who do commit suicide, most are young males aged 20–23; 2016 saw 22 cases in this age group. It is believed that lack of work and economic destitution are the primary contributing factors (*The Gleaner* 2017).

Reproduction

The contraceptive prevalence for Jamaica during 2008 and 2012 was 72.8 percent (UNICEF 2012). Contraceptive prevalence is the percentage of one or more partners in a relationship that use some form of birth control. In 2008, a Jamaica National Family Planning Board (NFPB) survey of 15- to 24-year-olds found that 82 percent of women and 86 percent of men knew where to obtain sexual health information, including contraception (MOH 2006).

The Ministry of Health’s Family Planning and Reproductive Health Programme created a policy to provide contraception to adolescents younger than 16 because minors (girls at age 15 and boys at age 12) were having their first sexual experiences younger than the age of consent. According to the Reproductive Health Survey, free contraception is provided in all 320 health care facilities (STATIN 2008).

Abortions are illegal under Section 72 of the Offences against the Person Act 1861. According to the law, “Any woman who seeks to procure an abortion and any person [who] uses drugs, poisons, noxious substances, instruments or other means to induce an abortion, commits an offence” (“The Offences Against the Person Act.” n.d.).

The Ministry of Health formulated an Advisory Group on Abortion Policy Review to decide whether to decriminalize abortion. At that time, on average, globally, there were 35 illegal abortions for every 1,000 women aged 15–44 (Guttmacher Institute 2016). Jamaicans favor being able to terminate a pregnancy in certain cases. Researchers discovered that “60 per cent of respondents support the legalization of termination of pregnancy under ‘special conditions’ such as ‘incest, endangerment of the woman’s physical or mental health and/or life’” (Linton 2014).

HIV/AIDS

Jamaica’s Ministry of Health conducted a surveillance survey of individuals who had HIV or AIDS during the years 1986–2011. According to the survey, HIV/AIDS is more prevalent in tourist areas and particular parishes. For example, Kingston, St. Andrew, St. James, and St. Catherine parishes account for 50 percent of all HIV cases. Urban parishes, including Kingston and St. Andrew, had approximately 1,570 cases per 100,000 people (MOH 2011). Additionally, the update reported that 661 males and 589 females had advanced-stage HIV. Although the MOH attributed a decrease of HIV/AIDS cases to antiretroviral (ARV) drugs, young women between the ages of 10 and 29 had the largest reported cases of AIDS compared to men in the same age range. However, men between the ages of 30 and 79 have the most incidents of AIDS compared to women in the same age range (MOH 2011). The report also found that 10 out of every 1,000 pregnant women were infected with HIV. The update stated that 595 bisexual males and 494 homosexual males had HIV (MOH 2011). The update did not include or identify lesbians or bisexual females. MOH admitted that the statistics for the homosexual and bisexual men might be underreported due to stigma and the danger of admitting homosexual activity.

Employment

Wages

The minimum wage is USD\$48 a week, or USD\$9.60 per day (U.S. Department of State 2013). In 2013, unemployment

for the country was 16 percent. Unemployment for youths between the ages of 15 and 24 was 34 percent. In 2012, unemployment for females in this age group was 42.6 percent and 27.1 percent for their male counterparts (CIA 2014).

Labor Force

In January 2014, of the approximately 1.3 million total workers in the labor force, women made up 45 percent (STATIN 2014). Women continue to be employed in large numbers in occupations that are considered traditionally female jobs, such as education, health, and social work. For example, 55,500 women are employed in the education sector compared to 19,400 men. For the 2011–2012 academic school year, the Ministry of Education (MOE) reported that in the teaching profession, females outnumbered their male counterparts by four to one (MOE 2014). The health and social work fields employed 27,800 women, compared to 9,100 men. The service sector also employs women in greater numbers. Hotels and restaurants employ nearly twice as many women (66,100) as men (37,100). The January 2014 Labor Force report showed that women’s employment grew in other sectors. Nearly 150,000 women compared to 112,400 men are employed in wholesale and retail of motor vehicle equipment; women (17,900) outnumber men (9,300) in the financial intermediation sector; and women (33,200) are slightly more often employed in public administration and compulsory social security than men (27,800) (STATIN 2014).

Maternity Leave

A benefit for female workers is that they receive 8 weeks of paid maternity leave. Jamaican expectant mothers are eligible for 12 weeks of maternity leave, with an additional 14 weeks if the mother or child is ill.

Family Life

Since 2001, marriages in Jamaica have decreased while divorces have increased. For example, Jamaica’s census indicates that, in 2001, 22,308 legal marriages occurred compared to 18,835 in 2013. In 2001, 1,691 Jamaicans divorced while, in 2013, 2,410 divorces occurred. Jamaicans participate in several types of conjugal relationships that do not include marriage: visiting unions, common-law marriage, and legal marriage. Visiting unions are defined as engaging in a relationship for the woman to receive financial assistance in exchange for physical and emotional

companionship (Handa 1996). After several years in a visiting union, the couple may cohabit or form a common-law marriage (794). After the common-law marriage, the couple may choose to legally marry. To move from cohabitation to marriage, the male must show he can financially care for the female and any children she may have (794). Jamaica does not have a national welfare system; therefore, men become the means by which women gain access to resources to support their families (Dreher and Hudgins 2010).

Jamaican women are expected to have children. If a woman does not have children, she is derogatorily referred to as a “mule.” Jamaican women’s primary responsibilities are considered the home and children. The Jamaican male’s responsibility is providing the economic security of his family (Seegobin 2009). In the past, when a woman worked, it was to provide extra income; however, women are becoming more financially independent through entrepreneurship (Bouchard 2014). When the mother is unable to care for her children, they are not sent to the father who may be able to care for the children financially, but to close relatives or friends. In addition, the mother may become a migrant worker, and her children may live with family members while the mother is away (Seegobin 2009).

Politics

The Jamaican political structure is a representative democracy. Jamaica has four branches of government: head of state, executive, national legislature, and judicial. Queen Elizabeth II is the head of state and is represented by the governor-general. The governor-general is appointed on the recommendation of the Jamaican prime minister, Portia Simpson Miller, who represents the executive branch (PRS Group 2013).

Eighteen is the legal voting age in Jamaica. Women gained suffrage in 1944 (Bouchard 2014). Women hold 8 of the 63 seats in the House of Representatives. The seats are divided among 3 women from JLP and 5 from PNP. Therefore, women hold just 15 percent of seats in Parliament and the Senate, despite a woman being prime minister (U.S. Department of State 2013).

Religious and Cultural Roles

Religious Roles

Although Rastafarians only have 29,000 followers, one of the smallest numbers of congregants in Jamaica, their views of women are in line with Jamaican culture.

Rastafari is a religion that developed in Jamaica in 1930 as a response to the British colonial rule (Thomas 2004). Rastafari began in 1930 because Haile Selassie I became the king of Ethiopia in that same year. Rastafarians believe that King Selassie I is God. Additionally, Rastafarians follow the beliefs of Marcus Garvey, who was also Jamaican. Garvey believed in the self-determination of Africans all over the world (45). The religion has a very definitive concept of women. For example, women are referred to as “daughters.” Obiagele Lake explains the status of Rastafari women as second-class citizens who must defer to the men in their lives. This deference to men is based on the false notion of women’s inferiority and the women’s ability to menstruate and birth children. Many Rasta men see their dominance over women as “a natural order of things as described in the Christian Bible” (4). In addition, women learn how to dress to not corrupt their femininity (4).

Cultural Roles

Dancehall is a Jamaican phenomenon known as *reggae*. Reggae is an elite or middle-class art form (Bakare-Yusuf 2005, 266). Dancehall is the “ruling class” music that rebels against “culture and civilization” (270). Like reggae, the blues and jazz in the United States were considered “lower class” and repugnant due to their style. However, these musical styles are now considered cultured and civilized. Like dancehall in Jamaica, rap and hip-hop in the United States are often considered “lower class” and include songs about violence and objectifying women.

Like rap, the dancehall music deck is a male space. The disc jockey uses homophobic lyrics and metaphors to denounce the homosexual lifestyle. DJs use dancehall to express their masculinity, their heterosexuality, and their sexual prowess. Although the dancehall deck is decidedly male, the dancehall floor is female. Dancehall women use their bodies and the dance not to be a conquest, but to remove the daily constraints and expectations that Jamaican society places on them. The dancehall is not space where women rebel; rather, it “is the arena where women exercise control over their bodies, stimulate sexual desire and call themselves into being” (270).

Issues

Trafficking

Trafficking of sex, drugs, and children is common in Jamaica. Women looking for work are lured into

massage parlors and later are forced into prostitution. Under the Sexual Offences Act 2009, procuration is the luring or procuring of a person into prostitution. The punishment of this offense is a fine or 10 years in prison (UN Women n.d.).

Children are vulnerable to trafficking when parents send their children to families with more resources for better opportunities. Sometimes they are coerced into prostitution and domestic servitude. The local “dons” who take advantage of the family’s misfortune are outside of the authorities’ control. Because of the authorities’ inability to control the dons, trafficking persists (U.S. Department of State 2013).

Single mothers are lured into drug trafficking because they are unable to provide for their children. These women, called “cocaine mules,” swallow bags of cocaine and travel to England. Inevitably, the women are caught and jailed in London. Therefore, their children remain in Jamaica to fend for themselves (Gillan 2003). Many of these women do not understand the seriousness of their crimes nor the potential severe penalties that the United Kingdom will impose. Not only is the mother punished, but the children as well. The children of drug traffickers suffer educationally, financially, psychologically, and nutritionally. In addition, without their mothers, they are separated from their siblings and fall prey to begging and prostitution (Klein 2004).

Violence

“Jamaica has one of the highest per capita homicide rates in the world” (Stephenson 2012). In 2011, 1,125 murders in Jamaica occurred in the first three months. Between January and March of 2012, 272 murders and 282 shootings occurred (39). In those same months, 300 sexual assaults were reported (40). The World Health Organization (WHO) considers violence as a health problem (Le Franc et al. 2008). WHO defined violence as “the intentional use of physical force or power, threatened or actual against . . . another person, or against a group or community . . . that either results in or has a high likelihood of resulting in injury, death, psychological harm, maldevelopment, or deprivation” (411).

This inclusive definition, does not exclude the possibility of physical or mental harm. Jamaica has the highest rate of violence against women (Le Franc et al 2008). The violence is still high after Jamaica passed the Domestic Violence Act in 1995 and amended it in 2004. Like the WHO

definition, the Domestic Violence Act includes all forms of violence, including sexual, physical, and mental abuse (Stephenson 2012).

Sexual Violence

Women were the most likely victims of sexual coercion. Jamaica has the highest rate of sexual coercion compared to Barbados, Trinidad, and Tobago (Le Franc et al. 2008). Twenty percent of Jamaican women experienced rape before the age of 20. The victim frequently knows the perpetrator, for example, her husband, a family member, or acquaintance. Sexual violence occurs more frequently between ages of 19 and 22 and less frequently for those 27 and older. The Ministry of Health and Environment reported in its 2007 annual report that 1,477 females and 80 males visited a public hospital for sexual assault (MOHE 2007).

One of the laws in Jamaica that addresses gender-based violence is the Sexual Offences Act of 2009. The act includes offenses such as rape, marital rape, grievous sexual assault, buggery, sex trafficking and procuration, sexual offenses in relation to children, and sexual offenses in relation to persons with mental impairment (UN Women n.d.). This law defines rape as sexual intercourse without the woman’s consent. If a woman is given false information about the sexual act or is physically threatened, she has not given consent.

The Sexual Offences Act addresses sexual offenses against children, including sexual intercourse with a child under 16 years, adults in a position of authority, procuring sex with children, or sexual interference and grooming. Sexual intercourse with a minor is having sexual intercourse with a child under the age of 16. The penalty for having sex with a minor is 15 years in prison. The act also mandates a maximum sentence of life in prison and a minimum sentence of 15 years in prison for people in positions of authority who have sex with a minor (UN Women n.d.). A new section makes a provision for those who sexually touch or groom a child for sexual purposes. The punishment for this criminal act is 15 years in prison. However, according to a UNICEF report on sexual violence against children, “men often believe they have a right to engage in sex with girls under their care” (Hahn 2012).

Beauty Standards

Much of the Jamaican beauty standards were set during slavery. During slavery as well as now, in Jamaican society, mulatto, “browns,” “browning,” or persons who are of

mixed race are considered the standard of beauty. Patricia Mohammed noted that people of dual racial identities were being elevated in local songs and European paintings. Italian painter Agostino Brunias created three images, “The Barbados Mulatto Girl 1780,” “A Negro Festival Drawn from Nature in the Island of St. Vincent,” and “The West Indian Washerwoman,” where the mulatto was the dominant figure (30). Mixed-race women were considered beautiful in part because their color was similar to whites or Europeans. Because of a woman’s light complexion, she had preferential treatment. During slavery, a mulatto woman had the best jobs, such as being a house slave rather than a field slave (40). Although Mohammed cautions that the degree of privilege mulattos received may be overrated, she contends that “both Black and mulatto female slaves were better placed to benefit from their intimate associations with Whites” (38). Mulatto male slaves did not have the same privileges as the female slaves; they were considered a threat to the power of the white male’s authority (30). The notion of a brown or light complexion during slavery made its mark in unusual ways in the contemporary Jamaican society.

Mohammed contends the “browning” or mulatto beauty standard is not exclusively based on physical features. She states, “A combination of aesthetic ‘acceptability’ from the point of view of white male society, together with the economic and social entrepreneurship of the more fortunate in this class of women contributed to the attractiveness of the mulatto woman” (43). The “aesthetic of acceptability” has translated in contemporary times to beauty competitions where the majority of the winners are light-skinned and in the use of chemicals to lighten one’s complexion.

In 1955, to celebrate Jamaica’s tercentennial anniversary as a British colony and later as a country, the government of Jamaica decided to have a beauty contest. This beauty contest, called Ten Types—One People, was unique in that contestants would represent a particular nationality and color (Rowe 2009, 39). Examples of names include “Miss Ebony,” “Miss Mahogany,” “Miss Satinwood,” “Miss Apple Blossom,” “Miss Pomegranate,” “Miss Sandalwood,” “Miss Lotus,” “Miss Jasmine,” and “Miss Allspice” (44). If these types were numbered 1 to 10, the darkest woman would be 1 and lightest would be 10. Therefore, “Miss Ebony” represents dark-skinned Jamaican women, while “Miss Allspice” represents women with part Jamaican and part Indian (India) heritage (44).

The Ten Types—One People beauty pageant reflected the country’s motto and a reaction to the event. In hopes

of unifying the country, the government of Jamaica created a slogan, “Out of Many, One People,” to recognize the many different types of racial groups in Jamaica as well as to unify them. The Ten Types beauty contest was intended to reflect the motto of the country and serve as a response to the Miss Jamaica beauty contest. The Miss Jamaica contest was notorious for selecting only light-skinned, mixed-race women, which for many people implied that a light complexion was the standard of beauty and that dark skin was ugly.

In reaction to the Ten Types—One People beauty pageant, another event, Caribbean Fashion Week, included designers and models of all nationalities and throughout the color spectrum (Cooper 2010, 387).

A practice that many feel is a direct result of the preference for a light complexion, which started during slavery, is skin bleaching. Skin bleaching is when a dark-skinned person changes his or her skin color through chemicals. Some of the chemicals are homemade or mixed with products sold on the market, such as Dermaclear, Nadinola, and Topiclear. In addition, some state that a bleaching pill exists (Charles 2003, 715). Skin bleaching is neither an exclusively Jamaican nor African practice; it is practiced throughout the world. Skin bleaching is mentioned in the dancehall songs and is a lecture topic at the University of West Indies (Brown-Glaude 2013).

Jamaican females primarily bleach their skin to become more attractive to Jamaican males and to avoid colorism, which is “the process of discrimination that privileges light skin people of color over their dark skin counterparts” (Charles 2011, 376). However, when males bleach their skin, it is viewed by others as a homosexual act. In March 2011, Vybz Kartel, a dancehall deejay, was invited to lecture at the University of the West Indies (UWI) to discuss his skin bleaching and to defend his heterosexuality (Brown-Glaude 2013, 53).

M

Mexico

Overview of Country

The United Mexican States, commonly known as Mexico, is the fifth-largest country in the Americas and measures 758,449 square miles (almost 2 million sq. km). It has a population of approximately 125 million. With coasts along both the Atlantic and Pacific Oceans, it shares a border with the United States to the north and Guatemala to the south. Its varied climate includes tropical, subtropical, and temperate regions, and it has a diverse topography owing to its two mountain ranges that run north to south—the Sierra Madre Occidental and the Sierra Madre Oriental.

The Aztecs, part of the nomadic Chichimecas, who once lived in present-day Mexico's northern frontier, including parts of the American southwest, began their migration to the Valley of Mexico in the early 1100s. By the time of European contact, this small nomadic society had employed warfare and intimidation to subjugate the region's sedentary societies and established the Aztec Federation—roughly the size of present-day Mexico. The federation, a decentralized imperial empire, was the largest in the Americas, with approximately 15–25 million inhabitants. The Aztec capital, Tenochtitlan, located in what is now Mexico City, with its approximately 200,000 inhabitants, was the largest city in the Americas at the time (McCaa 1997).

After the Spaniards and their indigenous allies, especially the Tlaxcalans, conquered Tenochtitlan (1519–1521), Mexico remained a Spanish colony for three centuries—part of the Viceroyalty of New Spain—encompassing what is now Mexico and Central America, the southwest United States, the West Indies, and the Philippines. Despite a demographic collapse caused by disease and exploitation, which destroyed approximately 90 percent of the native population in the 1500s, indigenous society and culture survived and rebounded in the 1600s and 1700s. Because the Spanish colonial system depended on Indian villages for its survival, indigenous society remained intact throughout the colonial era, albeit in a modified form. Along with indigenous peoples and Europeans, the importation of approximately 200,000 predominantly male enslaved Africans during the colonial era created a racially and culturally diverse society (McCaa 1997). Religion was an important aspect of Spanish colonization. The Spanish Crown put considerable resources into converting the indigenous population to Catholicism, relying on the regular clergy, including the Franciscans, Augustinians, Jesuits, and others. From this, a syncretic form of Catholicism that incorporated indigenous elements developed.

Mexico became independent from Spain in 1821. Shortly after, Central America broke off (1823) and became an independent entity called the United Provinces of Central America, which later divided into five separate nations. Twenty-five years later, as spoils of the Mexican-American

War (1846–1848), the United States annexed the northern half of Mexico and shortly thereafter acquired more territory through the Gadsden Purchase (1853), leaving Mexico with its current boundaries.

Liberalism became dominant in the 19th century, with liberals' victory over conservatives and the Catholic Church during the Reform era of the 1850s. Mexico modernized in the latter part of the 19th century, an era marked by industrialization, railroad construction, and booming exports. The early 20th century was also an era of change, as Mexico experienced a violent revolution (1910–1920) followed by a decade of reconstruction. In the late 1990s and early 2000s, Mexico experienced significant population growth. High birth rates and decreased infant mortality rates have led to today's large population of young people. Mexico is more urban than rural, and Mexico City, the largest city and the country's capital, is home to 23 million inhabitants. As a diverse nation composed of cities, towns, and traditional villages, Mexico's population is predominantly mestizo (a blend of natives, Europeans, and Africans). In some coastal regions, such as Veracruz, there is a stronger African heritage than in other areas. Indigenous societies are more prominent in Central and Southern Mexico; the states with the highest percentage of indigenous peoples are Oaxaca, Veracruz, Chiapas, Puebla, and Yucatán. Mexico's indigenous population is calculated at 8–11 percent of the total, and there are 56 recognized indigenous languages. In Oaxaca and Yucatán, more than half the population speaks an indigenous language; otherwise, Spanish is spoken by the vast majority of Mexicans (Fox 1999).

Overview of Women's Lives

The Gender Inequality Index gives one perspective of women's overall condition, Mexico ranks 74th of 188 countries (.373) (UNDP 2011). Furthermore, race, class, and region affect females disparately, making distinguishing women's experiences, despite their common gender.

Girls and Teens

Education and Gender Roles

Male and female literacy rates are similar, and Mexico ranks 81st out of 142 countries in literacy (CEDAW 2012). While this suggests gender parity nationally, at the primary and secondary school levels, there are regional differences. Southern Mexican states, with the largest indigenous populations, rank lower on educational attainment for women

than central and northern states, such as Chihuahua, the Federal District, and Nayarit (Frias 2008). Reflecting this disparity, in urban areas, the illiteracy rate for women is 5.3 percent, considerably lower than the 18.2 percent illiteracy rate for women in rural areas (CEDAW 2012). Economics partly explains this disparity; educational pursuit places an economic burden on impoverished and indigenous families. A 2011 study found that indigenous girls drop out before middle school more frequently than their male counterparts. Limited financial resources are a factor in indigenous girls' school dropouts, but cultural responsibility to fulfill a gender role as caregiver can also pressure females to leave school (Mijangos-Noh and Cardos-Dzul 2011, 73).

To encourage children to stay in school, Mexico launched Prospera, a social assistance program in the 1990s (previously Oportunidades). The government maintains that no political strings are attached to receiving benefits (Smith-Oka 2013, 9, 46). Eligible families or mothers receive direct cash payments when they continue their children's primary and secondary education and take them for regular check-ups and preventive health care at local clinics (UNDP 2011; Smith-Oka 2013, 44–45, 77). Food grants are also distributed, supplementing nutrition for young children and pregnant or lactating mothers. In 2011, more than 58 percent of the eligible population in Chiapas and Oaxaca participated in Prospera. The program decreased child malnutrition by 17.2 percent, increased secondary school enrollment for girls by 11 percent and boys by 7.5 percent, and increased the number of children under the age of five seen by health care professionals from 30 percent to 60 percent (UNDP 2011). Prospera has supported nearly 6 million families; however, many women live in remote environments, making travel to clinics difficult (World Bank 2015; Smith-Oka 2013, 77).

Teen Pregnancy

CEDAW found that Mexico reduced education for sexual and reproductive health and rights despite a high teen pregnancy rate of 67.3 per 1000 in 2004 (OECD 2007; CEDAW 2012, 9). This high rate affects young women's educational attainment. By itself, teen pregnancy is not necessarily a reason for dropping out of school, but socioeconomic disparities, pregnancy, and child care take priority over schooling, especially in communities where motherhood conveys more social standing than education (Campero et al. 2014). A study of impoverished Chiapan women concluded that for over half of the women, unpaid family caregiving duties

negatively affected their or their daughters' educational outcomes (Bergstrom and Heymann 2005, 273). Since 2004, the governmental grant program Programa de Becas para Madres Jóvenes y Jóvenes Embarazadas (PROMAJOVEN) has worked to address this issue by providing educational grants to young mothers and pregnant teens 12–18 years old who wish to continue or complete their education through the secondary level. In 2013, PROMAJOVEN provided grants for 17,094 teen girls and increased care coverage in rural and indigenous areas.

Recreation and Health

In 2006, the Mexican National Health and Nutrition Survey found that 32.5 percent of girls and teens were overweight or obese. In 2009, another study found that 31.4 percent of girls and teens between the ages of 10 and 19 watched television for seven or more hours per week and that 42.5 percent spent less than four hours a week doing physical activity. School nonattendance, urban living, and a higher rate of screen time increased the likelihood of youths being overweight (Morales-Ruán et al. 2009).

Education

Mexican girls have slightly higher enrollment for primary and secondary education than boys, though this is reversed for higher education (WEF 2014). Among those with a college education, there are 78 women for every 100 men. Women are underrepresented in certain disciplines and among professional researchers (Frias 2008, 228). Nevertheless, women have achieved more educational than economic parity. In the 15–29 age bracket, men are three times more likely to be employed or enrolled in educational training than women (OECD 2015). States with large indigenous populations have especially poor educational attainment overall (Frias 2008, 228). In 2012, CEDAW highlighted the labor market's gender segregation and how it resulted in lower wages for women. To combat this disparity, CEDAW recommended encouraging young women to pursue male-dominated fields, such as technical vocations (CEDAW 2012, 9; Frias 2008, 226).

Health

Access to Health Care

Mexico has significantly expanded health care coverage over the past decade, improving from the 1990s when

about half of the population lacked coverage (OECD 2015); many paid for health care out of pocket or did without, even though being uninsured violated a 1983 constitutional amendment ensuring Mexicans' right to health protection (Stebbins 1993, 212). In 2003, Congress voted to reform the Ley General de Salud (General Health Law) and the Ministry of Health implemented Sistema de Protección Social en Salud (Social Protection in Health), which provided comprehensive health care to poor families who did not have access to social security. Seguro Popular (People's Insurance), or public insurance, gave access, by law, to comprehensive health care for all. Despite this increased coverage, regional disparities persist because care is limited by geography and poverty. Wealthy Mexicans are unaffected by problems in the public health system because they routinely use private hospitals. The new health reform helped Mexican women because the former health care system was tied to formal employment; many Mexican women failed to qualify. Many Mexican and indigenous women still face considerable problems accessing health care due to poverty, geography, race, or all three.

Maternal Health and Reproduction

Under Mexico's health care system, all women have rights to reproductive care and family planning, services endorsed as early as the 1970s to limit population growth and promote small, healthy families (Smith-Oka 2015, 100). Women have access to condoms, birth control pills, intrauterine contraceptive devices (IUDs), and sterilization. Governmental programs and private organizations, such as Fundación Mexicana para la Planeación Familiar (the Mexican Family Planning Foundation), focus their efforts on women who use contraceptives to control their family size. Nevertheless, females who lack education, live in impoverished areas, and are in their teens often lack access to family planning strategies. Additionally, some follow official Catholic doctrine, which disapproves of contraceptives (Smith-Oka 2015, 100–101).

Diseases and Disorders

The HIV/AIDS epidemic started in Mexico in 1983 and has infected 0.3 percent of the population, which is among the lowest percentages in the Americas (Strathdee et al. 2012). Despite these positive statistics, in certain regions, such as the U.S.-Mexican border, cases of HIV/AIDS are on the rise. HIV/AIDS is concentrated among men who have sex with men, those who inject drugs, and sex workers.

According to 2013 estimates, the number of people living with HIV/AIDS is between 140,000 and 230,000. In 2013, the reported deaths from HIV/AIDS were 4,971. Under Mexico's health care policy, people infected with HIV/AIDS can receive antiretroviral therapy (ART); in 2014, more than 98,000 received ART treatment (Secretaria de Salud 2015, 27, 31, 73).

Obesity is a significant problem affecting Mexican women and men. Mexico surpasses the United States in adult obesity; almost one-third of the population in each country is obese (UNFAO 2013, 77–79). Additionally, over 70 percent of Mexican adults were overweight in 2014. Socioeconomic factors such as poverty and educational disparities contribute to these rates (OECD 2014, 3). The government combats obesity by encouraging exercise, taxing junk foods and soda, and collaborating with Coca-Cola for the Ponte al 100 Program (literal translation is “put the 100,” though “reach for 100” may better represent the meaning) (Rosenberg 2015; OECD 2014, 6).

Abortion

Mexico, like other Latin America countries, restricts women's ability to have abortions. It has fewer limits than El Salvador, Nicaragua, and Chile, which ban abortion in all circumstances. Laws vary from state to state, and abortions are only permissible under specific circumstances: a

threat to the woman's life or health, rape, incest, serious malformation of the fetus, an accidental miscarriage, or economic hardship, such as when a woman already has three children (Domínguez 2001, 19). In 2007, Mexico City decriminalized abortion. With more than 20 million residents, it became the most populous area in Latin America to legalize abortion. All Mexico City Ministry of Health hospitals and clinics are required to provide abortion services during the first 12 weeks of a pregnancy. Mexico City residents receive the service for free, and nonresidents pay a small fee. As of October 2013, approximately 90,000 abortions had been performed in Mexico City (Becker and Olavarrieta 2013). In reaction to Mexico City's law, other parts of the country and over half of Mexico's 31 states amended their constitutions by declaring that the right to life starts at conception (Wilson et al. 2011, 175). Reformed state laws permit the prosecution of women who have abortions as well as those who perform them. In some states, if a woman cannot prove she miscarried, she can be prosecuted for having an illegal abortion (Malkin 2010; Gaestel and Shelley 2014).

Indigenous Women's Reproductive Justice

Indigenous women have been targets of coercive techniques to limit their reproduction and have become skeptical of public health services. In 2013, the National

Women's Voices

Lucila Bettina Cruz Velázquez

Lucila Bettina Cruz Velázquez is a human rights defender in Oaxaca, Mexico. She is a member of the Assembly of the Indigenous Peoples of the Tehuantepec Isthmus in Defense of Land and Territory, the movement of Civil Resistance against High-Electricity Prices, and the National Network of Women Human Rights Defenders in Mexico. As with many other human rights defenders, she lives under threat, and since 2011, she has been provided with precautionary protection measures because she was assaulted by state police. She has worked against the negative impacts of wind farms on traditional indigenous lands and has therefore been subjected to judicial harassment, including charges of affecting national consumption and national wealth for which she was acquitted in 2015. According to Cruz Velázquez, the energy companies coerce farmers into accepting low-paying contracts. She is demanding new contracts that honor the rights of indigenous farmers.

Vance, Erik. 2012. “A Case of Big Wind Bullying in Mexico?” *The Christian Science Monitor*, February 28. Retrieved from <http://www.csmonitor.com/World/Americas/Latin-America-Monitor/2012/0228/A-case-of-Big-Wind-bullying-in-Mexico>.

Commission to Prevent and Eradicate Violence against Women reported that 27 percent of sterilized indigenous women were not consulted before the procedure—only the women's partners were consulted (U.S. Department of State 2015). Additionally, the maternal mortality is higher for indigenous than mestizo women. According to the Human Rights Index (2013), Mexico's maternal mortality is 49 deaths per 100,000 live births, but in states with a large indigenous population, the rate is much higher. According to 2011 statistics, Tamaulipas has the country's lowest maternal mortality rate at 15.7, and in Guerrero, a state with a large indigenous population, the rate is six times higher at 90 (UNICEF 2013, 4). Indigenous women's limited access to health care, fueled by socioeconomic factors, and suspicion of hospitals and clinics contribute to this higher mortality rate (Smith-Oka 2015, 103–104).

Employment

There is a gender gap in Mexico's formal labor market. About 78 percent of men have jobs, but only 45 percent of women are employed. These statistics do not capture the large number of women who work in the informal work sector—work that is unregulated, unmonitored by the government, unreported in the nation's gross national income, low-paying, and sometimes seasonal and illegal (OECD 2015).

Maquiladoras

More than 5 million Mexican women and men are employed in manufacturing work, many in the *maquiladoras*, factories that are often foreign-owned, predominantly by U.S. companies attracted by tax breaks, low wages, and the close location to the U.S. border. Products made in *maquiladoras* range from clothing to drones. In 2010, workers in *maquiladoras* in Juarez started at USD\$10 per day (Beaubien 2011). However, with an average weekly wage of 500 to 600 pesos (roughly USD\$40–\$50), workers in border towns earned more (Bacon 2015).

A recent report found that women comprised more than half of the textile, high-tech equipment (control navigation), electronics, and medical equipment workers. Factory owners target women, appealing to stereotypes about their abilities, such as manual dexterity to sew proficiently. Additionally, “*maquiladora* employers . . . showed a preference for hiring female workers, many of them still in their teens, who, managers believed would be more compliant”

(Lee and Lee 2010, 186). Finally, companies targeted women because they could pay them lower wages than men; employers asserted that women did not need to earn much because their pay supplemented their husband's. However, many female *maquiladora* workers were and continue to be the primary providers (Giles 2006, 9–10).

Discrimination and violence toward women are prevalent in *maquiladoras*. Most managers are men, in contrast to the large female workforce. There have been reports of sexual harassment, such as women having to reciprocate sexual advances by men to keep their jobs or to get benefits such as vacation days or pay bonuses (Parboteeah and Cullen 2013, 175). Some companies enforce pregnancy testing as part of the hiring process, do not hire pregnant women, or tell women they will be fired if they became pregnant (HRW 1996). Pregnancy discrimination is still an ongoing problem that has never been “full[y] investigat[ed],” and some link this continuing discrimination to the outsourcing of *maquiladora* jobs from Mexico to Central America and Asia (Tuttle 2012, 179–180; Lee and Lee 2010, 185).

Limited regulation and weak enforcement allows *maquiladoras* to pollute, threatening the environment and its inhabitants. Workers from varied industries can be exposed to toxic lead, brominated flame retardants, products that have aldehydes, mercury, potassium hydroxide, nickel, and many other chemicals and metals that can negatively affect workers (Lee and Lee 2010, 184, 185–186). Chemical components in batteries can irritate or burn skin and may cause birth defects and other reproductive problems. *Maquiladora* workers have higher mortality rates for cancer than elsewhere in Mexico (Lee and Lee 2010, 186). Environmental hazards from work sites spread to communities, causing poor air quality and contaminated water, especially when factories use local water supplies as toxic waste dump sites. The extent of these health problems has yet to be fully determined (Adeola 2011, 137).

Domestic Workers

Domestic workers face a high degree of exploitation. It is a labor sector that is largely unregulated and segmented by gender and ethnicity. Indigenous women, who do not speak Spanish as their primary language, make up about 80 percent of domestic workers. Social, cultural, and economic forces have segregated indigenous women into these low-paying jobs (Jimenez 2007, 139). These largely uneducated women typically start domestic work at a very young age, around 12–15 years old (Schwenken and Heimeshoff

2011, 70). Limited work opportunities in rural areas also contribute to why young women migrate to cities to gain employment and then end up as domestic workers.

Domestic workers who live with their employers typically earn less than half the minimum wage, which is 73.04 pesos per day (about USD\$4 in 2016), and work 14–16 hours a day, six days a week. More favorable estimates cite 12-hour days and pay slightly above USD\$2 per day (Schwenken and Heimeshoff 2011, 71). While Chapter 8 of the Federal Labor Law includes protections from physical and verbal violence and provides for meal breaks and clean sleeping quarters, working hours are unregulated. However, enforcement is lax to nonexistent, and, as of 2011, the minimum wage for domestic workers established by the National Commission of Minimum Wage had not been implemented (Schwenken and Heimeshoff 2011, 70–71; ILO 2015, 12). Further, many employers and domestic workers are ignorant of the law. Since 2000, the Mexico City–based Centro de Apoyo y Capacitación Empleadas del Hogar (Center for Assistance and Training of Domestic Workers) has advocated for domestic workers' rights and served as a placement agency that finds domestic workers employment with a guaranteed daily wage (Schwenken and Heimeshoff 2011, 70–71).

Birthing Assistants

In rural Mexico, many indigenous women work as *parteras*, traditional birthing assistants, which has pre-Columbian roots. While the Mexican government prefers the use of hospitals and clinics, many indigenous women still rely on *parteras* due to tradition and the distance to clinics. Recently, indigenous and rural women have increased their use of hospitals and clinics and limited the use of *parteras*. Adapting to change, *parteras* sometimes go with their clients to hospitals and clinics and are present for the delivery process (Smith-Oka 2013, 86–87). Many *parteras* have obtained midwifery certification, an accreditation blending traditional practices with contemporary health care (Smith Oka 2013, 85). Accreditation provides access to modern tools, such as gloves, gauze, measuring tape, thermometer, a scale to weigh a baby, and a Pinard stethoscope, enabling *parteras* to assist during birth in new ways.

Support for Pregnant Females and Mothers

Mexico has enacted restrictions and protections on women's employment, mainly for those who are pregnant and nursing, a group that is not permitted to stand for long

periods, work overtime, work after 10:00 p.m., nor be exposed to abnormal atmospheric pressure, chemicals, and other harmful materials. Women workers, including domestics, are granted 12 weeks off with full pay for maternity leave, 6 weeks before and after childbirth. Sixty-day extensions can be added, usually at half pay. Paternity leave is not available (ILO 2014, 48, and appendices II, IV, V). To avoid these restrictions and protections, some employers fire workers who are pregnant or on maternity leave. Women who are fired or dismissed largely have no recourse against their employers (ILO 2014, 91–92, 99).

The Programa de Estancias Infantiles para Madres Trabajadoras (Federal Day Care Program for Working Mothers), which provides child care for children ages one to four (longer for children with disabilities), was launched in 2007 to aid working mothers of impoverished families. Aside from income, the program does not have other conditions for eligibility. In 2011, more than 10,000 centers served 300,000-plus children. Along with child care, the program generated over 45,000 child care provider jobs, most filled by women (ILO 2014, 112; OECD 2012, 213).

Family Life

Data from 2008–2012 showed 22.9 percent of Mexican women were married before reaching 18 years of age (UNICEF 2013). In the event of divorce, either spouse may initiate the separation (SIGI 2014). In 2004, 1 in 10 marriages ended in divorce (OECD 2007). Women sometimes move in with their husband's family if the newlyweds cannot afford their own home. In a study of wives living in this condition in rural Mexico, women frequently described a life of silent servitude accompanied by feelings of loneliness or depression due to isolation from their natal family and friends. Women in urban areas enjoyed greater personal agency and reduced suffering in their in-laws' home than their rural counterparts (Pauli 2008, 175, 182). The percentage of households headed by women is low in comparison to other Latin American countries, but it is rising steadily (Chant 2002, 547, 551).

A 2014 U.S. Agency for International Development report asserted, "Patriarchal attitudes that impede women's human rights are a root cause of violence against women." For many men, machismo makes it difficult for them to accept real or imagined economic inferiority to their female partners, which can result in aggression against wives and children (Olivera and Furio 2006, 109). Traditionally, the expectation is that female family

members provide the majority or entirety of the housework and child care labor (Chant 2002, 552). Furthermore, the decision-making process within the family unit was often understood to ultimately be the prerogative of the husband (Covarrubias 2013). Juan Suárez-Villegas (2014) describes male and female gender identities in Mexico as wholly separate and mutually exclusive, where only the reeducation of boys and men will alleviate to the benefit of both genders.

While a growing number of women earn greater financial independence through their rising participation in the labor market, they often do so with little to no reduction in their domestic responsibilities. The result is a double burden, where women participate in paid labor and politics on top of housework and child care (Suárez-Villegas 2014, 188). A 2013 study found that social perceptions and moral arguments keep large numbers of women out of the workforce after marriage (Covarrubias 2013). Many respondents felt that to engage in salaried work after marriage would convey a failure to meet familial obligations in the home. Given that Mexican social beliefs place importance on women to be considered good mothers, this can keep many women from formal work. Furthermore, if a woman takes on work outside the home, it can be seen as threatening to the husband's social role as the family's sole economic support (Covarrubias 2013).

Within some Afro-Mexican communities, women participate in a custom called *la huida*, where potential husbands take young women hostage until they are married. It is seen as typical in some communities, and girls who have participated as well as the community leaders say it is nonthreatening Mexican authorities have treated the tradition as a form of kidnapping (Archibold 2014).

Politics

Antecedents to Mexico's federal republic can be traced to the late colonial era, especially the 1812 Spanish Constitution, aspects of which were utilized in the 1824 Constitution of the fledgling independent nation. Today's citizens vote by direct election for Mexico's president every six years. No reelection became a fixture after the 1910 revolution when politicians sought an alternative to Porfirio Díaz's three-decade dictatorship (Russell 2010, 296–299). Mexico's legislative branch is a bicameral assembly separated into two chambers: the Chamber of Deputies and the Senate. The Chamber of Deputies consists of 500 members elected for three-year terms. The Senate's 128 members

follow the presidential election cycle of a six-year term. Legislators cannot be reelected for consecutive terms. A simple majority passes regular legislation, while constitutional reforms must have a two-thirds majority (Seelke 2012, 11).

Mexico has three main political parties: Partido Acción Nacional (PAN, National Action Party), founded in 1939; the Partido de la Revolución Democrática (PRD, Party of the Democratic Revolution), founded in 1989; and the Partido Revolucionario Institucional (PRI, Institutional Revolutionary Party), founded in 1929 under a different name. There are also several smaller political parties. The PRI dominated the presidency and Congress during the 20th century. PAN won the presidency in 2000 and 2006, with the PRI regaining it in 2012.

Mexico has never had a female president, lagging behind other Latin American countries, such as Chile, Argentina, Brazil, Costa Rica, Ecuador, Bolivia, Belize, Nicaragua, and Panama. However, there have been female leaders at the national level. Josefina Vazquez Mota (1961–) ran for president in 2012 for PAN. She previously worked as the secretary of social development under President Vicente Fox, from 2000 to 2006, and the secretary of public education under President Felipe Calderón, from 2006 to 2009. In 2015, Margarita Zavala (1967–), a PAN deputy in the 2006 Mexican Congress and the wife of former president Felipe Calderón, announced her intention to run for the presidency in 2018, possibly as an independent (Atanasio 2015).

Mexican women have made political gains elsewhere. Women account for more than one-third of Mexico's federal legislators across the lower house and the Senate; this is comparable to Nordic countries, and it is more than in the United States. Furthermore, women serve as governors, mayors, and leaders of political parties. Griselda Álvarez (1913–2009) was the first female governor in all of Mexico, serving as governor of Colima from 1979 to 1985 (Rodríguez 2003, 40). Beatriz Paredes Rangel (1953–) served as governor of Tlaxcala (1987–1992), Mexican ambassador to Cuba, and president of the PRI (Rodríguez 2003, 154, 166). In 1999, Rosario Robles (1956–), a member of PRD, became the first female mayor of Mexico City. She has also served as the head of the PRD (2002–2003), secretary of social development (2012–2015), and secretary of urban and agrarian development (2015–) (Rodríguez 2003, 150; IBP 2015, 30; OAS 2016). Amalia García (1951–) served as president of the PRD and governor of Zacatecas (2004–2010). Many more women have

served as governors and in a range of capacities in government ministries (Camp 2011, 355).

Women's Suffrage

Women fought for their political rights in the early 1900s, but the idea of female suffrage met resistance in revolutionary Mexico. The Mexican Revolution had anticlerical elements, which is defined as “the church [as] the enemy of social justice, enlightenment, and progress” (Marías 1982, 69). Men in power, suspicious of women’s link to the Catholic Church, contended that if women were granted the right to vote that priests would influence them, undermining the revolution’s progressive agenda. Revolutionists noted that the Association of Catholic Women and the League of Catholic Women favored the church. Furthermore, in 1918, women in Jalisco boycotted the state, owing to the government’s plan to implement anticlerical elements of the 1917 constitution. Additional obstacles to women’s suffrage included a cultural attitude that women were intellectually and morally inferior to men and unable to cope with the pressure of being politically active (Marías 1982, 77).

Hermilia Galindo (1886–1954) and Elvía Carrillo Puerto (1878–1967) paved the way for women to participate in politics. Galindo served as secretary for President Venustiano Carranza (1917–1920) and became a candidate for deputy of the fifth constituency of Mexico City in 1917. She was voted into office but denied the position because the law prohibited women’s participation (Marías 1982, 32–37). Elvía Carrillo Puerto’s sibling, Felipe Carrillo Puerto, was the governor of Yucatán, and he granted women political rights in 1922. In 1923, she ran for the fifth district in Yucatán and won with over 5,000 votes. However, Carrillo Puerto and other women who earned offices were denied when her brother died and his enemies gained control of the government of Yucatán. She moved to San Luis Potosí and ran for the Chamber of Deputies in 1925. With the support of male politicians and the public, she won. However, opponents refused to seat her under Article 60 of the Constitution. She went back to Yucatán and organized Liga Orientadora de Acción Femenina (League of Feminine Action) that fought for women’s suffrage throughout the 1930s (Morton 1962, 9–11).

Support for women suffrage continued through the 1930s. Edelmire Escudero founded the Feminist Revolutionary Party, which in 1934 supported presidential candidate Lázaro Cárdenas of the Partido Nacional Revolucionario (eventually the PRI). After his election, feminists

organized for women’s right to vote, forming the Sole Front for Women’s Rights and the United Front for Women’s Rights. Additionally, Cárdenas set up the Feminist Action section within the PNR. In 1937, Cárdenas publicly championed women’s full political rights and sent the Senate a constitutional amendment that would change Article 34, thus defining citizenship by adding “men and women” and allowing women to vote and hold political office (Marías 1982, 143). The amendment was not ratified, and when Cárdenas left the presidency, women were still unable to vote (Marías 1982, 138–144). Women finally gained the right to vote for local elections in 1947 and national elections in 1953, later than several Latin American countries, including Venezuela, Uruguay, Panama, Guatemala, El Salvador, Ecuador, Dominican Republic, Chile, Brazil, Argentina, and Bolivia (Morton 1962, 83–84).

Gender Quotas and Parity

Mexico is one of many countries with political gender quotas (Dahlerup 2005, 141). The remaining Latin American countries without quotas are Chile, Guatemala, and Venezuela (Piscopo 2014, 2). Mexico started utilizing quotas in the 1990s, and they have recently become more effective. Congress established provisions for gender quotas in 1996, with a “recommendation” that parties diversify by requiring no gender hold more than 70 percent of candidate slots (Baldez 2004, 235). This strategy proved unsuccessful because parties were allowed to select women for alternate spots (*suplentes*). Congress revised the law in 2002, requiring 30 percent of each party’s candidates for deputy or senator be women, effectively closing the loophole (Baldez 2004, 235). In the 2002 midterm elections, women gained more than 22 percent representation (Dahlerup 2005, 146). Later, the quota increased to 40 percent, but scandal broke in 2009: political parties subverted the gender quota law by having women run in the main candidate (*propietarias*) slot while having a male candidate run as the alternate. When a woman won, she resigned, and the male candidate assumed the position, a strategy that was agreed upon by the male and female candidates beforehand (Froimovich et al. 2013, 25). Women replaced by men were called *Juanitas* (Piscopo 2014, 37).

In 2014, Mexico transitioned from gender quotas to parity, that is, fifty-fifty representation of men and women within the national legislature (parity can be expanded to state and local levels). Senator Marcela Torres Peimbert championed the shift on ethical grounds, stating “parity

does not mean a gift or concession; it means making Mexico a more just country” (Piscopo 2015, 7). Supporters maintain parity closes loopholes within the quota system. Parity was in place for the 2015 midterm elections for the lower house in Congress and will continue to have an impact, as women currently constitute about 42 percent in the lower house and about 33 percent in the Senate (IPU 2015).

Religious and Cultural Roles

Starting in the mid-19th century and continuing to the present, Protestantism has made inroads in Mexico. Nevertheless, over four-fifths of Mexicans today are Catholics (Pew Research Center 2016). The Virgin of Guadalupe, with its colonial-era origins, is still a very popular symbol of Mexican Catholicism and cultural fusion. Día de los Muertos (Day of the Dead), celebrated at the onset of November, during which Mexicans create altars with offerings of flowers, candles, or food to honor deceased family members, is another example of syncretism. Día de los Muertos blends Catholic and pre-Colombian religious beliefs. Pan-Roman Catholic feast days (All Saints’ Day) combine with Aztecs’ preoccupation with death, which manifested itself in feast days in honor of the deceased (Brandes 1997).

While the Catholic Church and the conservative gender ideology associated with it have limited women’s opportunities to fully participate in it, some options exist. Convents were prominent from the colonial era until the mid-19th century Reform Era, when many were shut down. Becoming a nun was a career option not only for whites, but also indigenous women. Mexico’s most famous nun, Sor Juana Inés de la Cruz (1651–1695) enjoyed the freedom being a nun offered her to study and write, and her writings continue to be read today.

Since independence, women have participated in voluntary Christian lay associations. Starting in the mid-19th century, some religious associations have had predominantly female members and leadership and have exerted considerable independence (Chowning 2010). For example, the Catholic lay organization the Ladies of Charity of St. Vincent de Paul had more than 20,000 active members and more than 20,000 honorary members in 1910. It remains active today (Arrom 2007). Social Catholicism, strengthened by Pope Leo XIII’s 1891 encyclical *Rerum Novarum*, influenced female religious associations to engage in charity work; these associations also played cultural and political roles. After church repression during the 1850s Reform Era, female participation and activism

The Virgin of Guadalupe

As the story goes, the Virgin Mary appeared to a Mexican peasant named Juan Diego in 1531 and asked him to see to it that a church be built in her name on that spot. She called herself “Santa Maria de Guadalupe.” Many scholars believe the name *Guadalupe* was actually a mistranslation of the Aztec word *Coatlallope*, which means “one who treads on snakes.” The Virgin appeared to Diego as a dark-skinned person, and her story was told in an indigenous language.

As the people of Mexico converted in large numbers to Catholicism, the figure of the Virgin of Guadalupe grew in importance, and in 1737, she became the patroness of Mexico City. In 1910, Pope Pius X named her patroness of Latin America. In the 19th century, she also became associated with Mexican nationalism. She was especially embraced by the women of Latin America. For contemporary feminists, she has provided an opportunity to examine the archetypes of women in Latin America and reinterpret them as aids in resistance to sexist oppression.

aided the Catholic resurgence during the Porfirian era (1876–1910). Female lay religious organizations also supported the church when it came under attack during the 1910 Mexican Revolution. Women later aided pro-church rebels when the Cristero Rebellion against the state broke out in the late 1920s.

Issues

Domestic Violence and Femicide

Violence against women, a global problem, is widespread in Mexico (CMDPDH 2012). Some suggest that Mexico’s machismo/marianismo culture encourages violence

against women because machismo encourages men to be aggressive, self-confident, and hypersexual, and marianismo encourages women to display purity, moral superiority, and passivity. Without disputing this analysis, recent interpretations of gender and culture are more nuanced (Coerver et al. 2004, 199–204). Mexico has enacted laws to fight violence against women; but some are inadequate, and enforcement is deficient. In 1996, the *Ley de Asistencia y Prevención de la Violencia Intrafamiliar para el Distrito Federal* (Law for the Assistance and Prevention of Intrafamily Violence for Mexico City) was passed, but it only applied to Mexico City (Falcón 1999, 344). In 2007, Mexico enacted the national *Ley General de Acceso de las Mujeres a una Vida Libre de Violencia* (Law on Women's Access to a Life Free of Violence), but it has proved difficult to implement. Furthermore, domestic violence often goes unnoticed and unreported. Cultural factors in underreporting include the idea that such violence is a private matter and a characterization of female reporters as impure (Amnesty International 2008, 3). Laws themselves also contribute to underreporting. Some make violence against women difficult to prove. For example, in some states, women are required to have two witnesses for police to investigate a charge (Amnesty International 2008, 7; HRW 2015).

Femicide, violence against women that causes death, is an enormous problem in Mexico. Mexico ranks 16th in the world for homicides against women, and many cases go unsolved (CMDPDH 2012). Femicide has many causes, takes place in many contexts, and has been exacerbated by the proliferation of Mexican drug cartels and the drug war, waged most intensely by former Mexican president Felipe Calderon (2006–2012) and today by President Enrique Peña Nieto. The drug war and organized crime have contributed to femicide by perpetuating the extreme form of violent machismo. Women are often caught in the crossfire between the cartels and the police. Women who associate with organized crime through familial ties or relationships are often the targets of rival gangs. Rape and violent deaths are used to send messages to rival gangs, the government, and the community (UNHCR 2015, 4, 6, 38, 48). Furthermore, women who “tend to be young, poor, illiterate or with little schooling, single mothers, and are responsible for the care of their children and other family members” are involved in cartels and are commonly used as drug mules to transport contraband throughout Mexico and into the United States (Scheller 2014). Women can die carrying the drugs or be imprisoned. Eighty percent of Mexican women in prison, Centro Federal de Readaptación

Social (Federal Social Readaptation Centers), are serving time for drug-related sentences (Scheller 2014).

In 2009, the *Comisión Nacional para Prevenir y Erradicar la Violencia Contra las Mujeres* (National Commission to Prevent and Eradicate Violence against Women) was created to address domestic violence and femicide (CMDPDH 2012). By 2013, nearly all Mexican states and the Federal District had laws criminalizing femicide. However, in some states, if perpetrators can prove infidelity, they receive a reduced sentence. Despite legislation, many states, including Chiapas, Chihuahua, Durango, Guerrero, Michoacán, Oaxaca, Sinaloa, Sonora, and the Federal District, have seen a dramatic increase of femicide (Amnesty International 2013; CMDPDH 2012). In August 2015, Mexico issued a gender alert because over 1,500 young girls were missing and about 70 percent of murders of women had gone uninvestigated (De Cicco 2015).

Dozens of women, including Congresswoman Xochitl Arzola Vargas, have protested against this increased violence and inadequate government response outside Mexico's Interior Ministry. Feigning death, women lay lifeless surrounded by chalk outlines and evidence markers (De Cicco 2015). Femicide and its relation to the drug war motivated the UN High Commissioner for Refugees to issue an alert of a potential refugee crisis. Interviews by U.S. officials found that 82 percent of 16,077 women from Honduras, El Salvador, Guatemala, and Mexico had credible fears of persecution or torture and have been allowed to seek asylum (UNHCR 2015).

Marginalization of Afro-Mexicans

Enslavement of Africans was not as widespread or numerous in Mexico as compared to other parts of the Western Hemisphere. When slavery was abolished by decree in 1829, only a few thousand enslaved Africans remained. This, combined with postrevolutionary Mexico's reputation as a center of racial equality, contributed to the lack of acknowledgment of racism against Afro-Mexicans until recently. A 2004 report for the UN International Convention on the Elimination of All Forms of Racial Discrimination stated, “Mexico acknowledges that racism, racial discrimination, xenophobia and related intolerance continue to exist at all levels of Mexican Society” (Sue 2013, 189).

Reflecting this, in 2003, the Mexican government created the *Consejo Nacional para Prevenir La Discriminación* (CONAPRED, National Council for the Prevention of Discrimination) to promote equality and protect all citizens

from discrimination based on ethnicity, sex, age, disability, health, and sexual orientation. Furthermore, insensitivity to race became bad publicity. President Vicente Fox, for example, caused outrage in both the United States and Mexico in 2005 when he opined that Mexicans “are doing the work not even the blacks want to do there in the United States” (Sue 2013, 114). Journalist Eduardo Añorve Zapata asserted that Fox’s statement overlooked black Mexicans and those with combined African and Mexican heritage who migrate to the United States for work. Such statements reinforce Mexico’s belief of “nonblackness” (Sue 2013, 114–115).

Like Zapata, a 2011 CONAPRED campaign acknowledged Afro-Mexicans and protested racism with its slogan “For a Society Free of Racism” (Sue 2013, 192). In 2015, the government, in reaction popular pressure to recognize Mexico’s African heritage, allowed Afro-Mexicans to choose *black* as their ethnicity in the national census (Edwards 2015). The census recorded 1.4 million Afro-Mexicans.

Human Trafficking

Human trafficking is a widespread and lucrative illegal business in Mexico. A 2010 estimate calculated 20,000 people trafficked, but many believe that the number is far higher, possibly as many as 50,000. U.S. officials maintain that “Mexico is a large source, transit, and destination country for men, women and children subjected to sex trafficking and forced labor” (U.S. Department of State 2014). The destinations for victims are often tourist cities, such as Mexico City, Tijuana, and other border towns. Human traffickers often victimize the most vulnerable, including rural women, children, indigenous people, and migrants. Traffickers also victimize men, exploiting them as forced labor. Many victims are tricked with the promise of employment opportunities or marriage (U.S. Department of State 2014). The Mexican government protested trafficking in 2000 by signing the UN Convention against Transnational Organized Crime, which included the “Protocol to Prevent, Suppress and Punish Trafficking in Persons, Especially Women and Children.” In 2007, the government also enacted *Ley para Prevenir y Sancionar la Trata de Personas* (Law to Prevent and Punish Trafficking), which penalizes those convicted of trafficking with prison sentences of 6–12 years. Aspects of the law made it hard to prosecute traffickers, and the government revised it in 2012 and 2014.

Furthermore, protecting witnesses has proved difficult. The specialized protection and housing that survivors

Mujeres y Cultura Subterránea

Mujeres y Cultura Subterránea, A. C. (MCS) (Women and Underground Culture), officially emerged in 2000 as a collective vision and praxis in Mexico City, Mexico. Inés Morales and Susana Quiroz, two poor Mexican lesbian filmmakers, began MCS through their collaborative friendship in the 1990s. Their life’s work has been to create vibrant representations of communities that are often victimized or rendered invisible. MCS shares political and poetic stories by producing documentary videos with fictional elements and by offering creativity- and health-focused workshops and training in skills and trades to address injustices in local communities.

As its name reveals, the group’s methodology of work is rooted in underground culture, giving an urban street view based on a “punk style” do-it-yourself ethos. MCS tells the complex stories of marginalized women, children, differently abled people, LGBTIQ communities, and elder generations and highlights the structural violence they face in Mexico City.

Their films include *Gritos poeticos de la urbe* (1995), *Ciudad adicta* (1998), *La dimension del olvido* (1999), *Pisadas femeninas sobre el asfalto* (2000), *Lunas de pasión* (2006), and *Sueños del Polvo* (2014). MCS has screened their films internationally, including at the *Twelfth Women of Color Film Festival* at the University of California Santa Cruz. The Global Fund for Women, Semillas, La Media Luna, and others have supported MCS.

Since the first Marcha Lésbica in Mexico City in 2003, MCS has been central to the *Comite Organizador de la Marcha Lésbica Mexico* by reaching out to musicians and lesbians in poorer barrios. For more information, visit their Web site: <http://www.mujeresyculturasubterranea.org>.

—Susy Zepeda

of trafficking who help prosecute their traffickers need is lacking in many countries, including Mexico. Another roadblock to prosecution is underreporting. Like prostitutes, victims often do not come forward because they can be criminalized by the law, and they fear reprisals from traffickers. In 2013, the United States granted USD\$1.9 million to nongovernmental organizations (NGOs) in

Mexico, the Dominican Republic, and Honduras to help combat human trafficking (Seelke 2015, 9–10). Nevertheless, trafficking remains a significant problem.

LGBTQ Community

The LGBT (lesbian, gay, bisexual, transgender) community within Mexico has made significant gains. Same-sex marriage was first legalized in Mexico City, and the Supreme Court ruled that all of Mexico's 31 states had to recognize the marriages performed in Mexico City. The Supreme Court ruled in favor of same-sex couples adopting children in 2010 and that couples could claim health and social security benefits from the government in 2014. Only three states have followed the Federal District and legalized same-sex marriage: Chihuahua, Coahuila, and Quintana Roo (HRW 2015, 383). The Mexican government has changed the Civil Code to allow transgender individuals to legally change their names and gender (Arnal 2014, 6). Both Patria Jiménez (elected in 1997) and Benjamín Medrano (elected in 2013) have represented the queer community. Jiménez was the first openly gay member in any Latin American legislature (Rodríguez 2003, 189). Despite advancements in Mexico for the LGBT/queer community, homophobia persists.

N

Netherlands Antilles/Dutch Caribbean

Overview of Country

The Netherlands Antilles (also known as the Dutch Antilles or the Dutch Caribbean) is located in the Caribbean Sea. The islands extend across 500 miles, bringing them 50 miles off the coast of Venezuela. As a country, it was made up of six islands: Aruba, Curaçao, Bonaire, Saba, Sint Maarten, and Sint Eustatius. In 1986, Aruba separated from the Netherlands Antilles and became its own self-governing country. In 2005 and 2009, Curaçao voted to be a self-governing nation with the Kingdom of Netherlands. In October 2010, the formal dissolution of the Netherlands Antilles became effective. As a result, Curaçao and Sint Maarten became self-governing. Bonaire, Sint Eustatius, and Saba (BES) became municipalities of the Netherlands (PAHO 2012). Bonaire and Sint Eustatius are now called the Netherlands in the Caribbean or the Caribbean Netherlands. The Netherlands, Aruba, Curaçao and Sint Maarten are now considered the Kingdom of Netherlands (Government of the Netherlands n.d.).

Aruba

Alonso de Ojeda landed on Aruba in 1499. The Caqueto Indians of the Arawak tribe, also known as the Amerindians, first inhabited Aruba. These inhabitants were

simultaneously fishers, hunters, and gathers. In 1513, the Spanish enslaved the Caqueto people to work on the Spanish plantations currently known as the Dominican Republic and Haiti. According to historians, by 1862, the Amerindians were decimated (CIA 2017a).

The Dutch colonized Aruba in 1636. Formerly a part of the Netherlands Antilles, it became a self-governing country within the Kingdom of the Netherlands in 1986. Aruba began the process of becoming completely independent, but halted this in 1990 (CIA 2017a).

Many Arubans speak multiple languages, including English, Spanish, and Portuguese. Dutch and Papiamentu are the island's official languages. As of July 2016, Aruba's population was 113,648. Under the age of 15 years, males (10,068) outnumbered females (9,999). Additionally, Aruba had more men (7,441) between the ages of 15 and 24 than women (7,366). However, over the age of 25, women outnumbered men in all age groups. The birth rate out of 1,000 live births was 12.5. The death rate was 8.3 (CIA 2017a).

Bonaire

The history of Bonaire began approximately 1,000 years ago when the Caiquetios sailed from Venezuela. In 1499, the Spanish, specifically Alonso de Ojeda and Amerigo Vespucci, landed on the island and claimed it. However, not seeing commercial value, they departed, taking along

with them enslaved Caiquetios to work on Hispaniola (InfoBonaire 2017).

In 1634, the Dutch colonized Bonaire and Curaçao (CIA 2017b). The Dutch West Indies made the island a large plantation and brought the first enslaved African slaves to work in agriculture, cultivating maize and harvesting salt. In the following 182 years, the islands changed hands many times. However, the 1816 Treaty of Paris returned the island to the Dutch. Bonaire is now a part of the ABC (Aruba, Bonaire, Curaçao) islands, and in 2010, the island became a special municipality of the Netherlands (InfoBonaire 2017).

Bonaire's population is 18,905 people. Eighty percent of the population is of Dutch nationality. Sixty-four percent of the island inhabitants' first language is Papiamentu (CBS 2015). In 2015, the number of women increased 22 percent compared to 17 percent for men. However, the majority of the population is men (52%) (Statistics Netherlands 2016).

Saba

Saba is a part of the Leeward Islands. The island is an extinct volcano that was discovered by the Europeans in 1632. The Arawak Indians first inhabited the island. Like the other Caribbean Netherlands islands, many European colonists claimed it before the Dutch acquired it in 1816 (Caribya! 2017).

Saba has 1,947 inhabitants, 978 men and 969 women. There are 278 children under the age of 15, and 103 men are older than age 65. Fifty-five percent of the population was born elsewhere, such as the United States, Canada, or the Dominican Republic (Statistics Netherlands 2016).

Curaçao

Curaçao is part of the Windward Islands and was settled by the Arawak Indians. In 1634, the Dutch colonized the country (CIA 2017b). The island, which is 30 miles off the coast of Venezuela, is twice the size of Washington, D.C. (CBS 2011). The highest point of elevation is Mount Christoffel, which is 1,230 feet. The flattest part of the island is Table Mount. Curaçao's population is 150,563, with 68,848 men and 87,715 women, or 84.3 men per 100 women. Most live in the south-central area of the island near the oil refinery, the harbor, and the government offices (CBS 2011).

Curaçao became the center of slave trade. The island was so dependent on the slave trade that slavery was not abolished until 1863. Some sources state that the abolition of slavery hurt the island's economy. As a result, Curaçao's economy did not fully recover until the 20th century, when

oil was discovered. In 1954, the island became of a part of the Netherlands Antilles. In two referendums held in 2005 and 2009, the people voted for Curaçao to become a self-governing nation. The wishes of the Curaçao people did not occur until 2010, when the Netherlands Antilles was dissolved (CIA 2017b).

Sint Eustatius

Sint Eustatius (also known as Saint Eustatius and Statia) is 6 miles long and 3 miles wide and has two distinct volcanos. Sint Eustatius was colonized by the French and English in 1625. In 1632, the Dutch, who initially named it Niuew Zeeland, claimed it from the French and English. Between 1664 and 1674, Sint Eustatius was taken 10 times. By 1780, Statia became a center of trade, including for slavery. In November 1776, the island was the first foreign government to recognize the United States as an independent country and became a major source of supplies for the North American colonies.

Sint Maarten

The first inhabitants of Sint Maarten (also St. Maarten) were from the Amazon basin, likely the Arawak, followed by Christopher Columbus, the first European to see Sint Maarten and claim it for Spain in 1493. The island did not appear on a map until 1516, as Sam Mtim, when the Spanish began colonizing it. In 1648, Spaniards left the island to the French and Dutch to fight over. It changed hands 16 times until the 1817 Treaty of Paris, which drew the boundaries it has today (UNDP 2011).

In 1633, the Spanish took it back from the Dutch. In 1648, the Dutch and the French split the island. The Dutch side of the island is named Sint Maarten, while the French side is called Saint Martin (or St. Martin). In 1863, slavery on the Dutch side of the island was abolished. The decline of the economy in 1939 was attributed to the establishment of a free port. In the 1950s, Sint Maarten became a place for vacationing tourists. In 1954, the island became a part of the Netherlands Antilles, and in 2010, it became an autonomous country within the Kingdom of the Netherlands (CIA 2017c).

In 2016, Sint Maarten's total population was 41,486. Of that number, 21,007 women lived on the island compared to 20,479 men. Males 19 years old and younger slightly outnumber females of the same age. However, between the ages of 20 and 34, women slightly outnumber men. This trend also occurs for almost all ages 45 and older (CIA 2017c).

Overview of Women's Lives

The Dutch Caribbean islands are included in the UN list of Small Islands Developing States (SIDS), along with many of the other islands in the Caribbean and the Pacific (IFAD 2016). By joining in this way, the islands can promote their resilience and protection, and this affords international comparisons, such as the Gender Inequality Index (GII). Taken as a whole, the SIDS calculated GII was 0.474 in 2014, placing it above the world value of 0.449 (UNDP 2015). Women in this region are supported by UN Women to promote women's leadership, economic empowerment, and nondiscrimination and planning and to combat gender-based violence. Successes include the institutionalization of the Caribbean Institute for Women in Leadership program, which promotes women's, including young women's, participation in politics; strengthening domestic workers rights; the creation of national action plans to combat violence against women; and encouraging countries' compliance with the Convention on the Elimination of All Forms of Discrimination against Women (CEDAW) goals (UN Women 2017).

Girls and Teens

Girls often grow up with a large extended family. If their mother is young, their grandmother may step in and act as a second mother. While girls generally like and are proud of their islands and small communities, they recognize the sometimes limiting opportunities, including poor schooling, family violence, and poverty. Many escape to the European Netherlands, and some return to help develop their home islands (Kloosterboer 2013 15).

Dutch Caribbean girls and teens, like those around the world, enjoy sports such as soccer (or football), which they participate in through the Oualichi Women's Soccer Association. Sint Maarten recently hosted a soccer tournament where the Oualichi Women's Soccer Team, CVV Willemstad from Curaçao, Sv. Oemasoso from Surinam, and the Bonaire Female Selection all competed. Soccer is relatively new for Bonaire and Sint Maarten and less so for Curaçao (721new.com 2015).

Education

The Minister of Education, Culture, and Science is responsible for Bonaire, Sint Eustatius, and Saba's (BES) education policies. The future goal is for students in BES to have a diploma comparable to the one students receive in the Netherlands (Rijksdienst Caribisch Nederland 2016).

Bonaire has seven government-funded primary schools, one secondary school, and vocational schools. Saba has one government-funded primary and one secondary school (CBS 2015). Saba workers who are born on the island have lower levels of education (CBS 2015).

Aruba

The Aruban government almost entirely finances the national education system, except private schools. Aruba has three types of general secondary education schools: MAVO, HAVO, and VWO. Students attend MAVO schools for four years and get a general secondary education. HAVO is the higher general education and lasts five years. VWO is a preuniversity education that lasts six years (Visit Aruba 2017).

In 2014, the net enrollment for preprimary education for females was 98.5 percent, compared to males at 99.3 percent. Primary education enrollment for females (99.4%) and males (99.1%) were nearly equal. In tertiary education, gross enrollment was doubled for females (23.04%) compared to males (10.14%). Aruba's total literacy rate for 2015 was 99.37 percent. For adults 15 years and older, the percentage for males was 97.54 and 97.51 for females. In 2014, Aruba ranked 111th in gender inequality in education compared to other countries (UNESCO 2016a).

Curaçao

At 99 percent, almost all Curaçaoan children enrolled in primary education in 2014; there was little difference by gender at this level of schooling (UNESCO 2016b). In 2011, 76 percent of children enrolled in secondary education, but more girls enrolled (80%) than boys (73%). This gap increased for tertiary, or postsecondary, education. In 2015, 12 percent of Curaçaoan men attended, representing half the rate of women. Twenty-eight percent of women enrolled in tertiary education (UNESCO 2016b).

Employment

Aruba

In 2010, 60.5 percent of females 15 years and older participated in the Aruban labor market. Many work in government and the tourism sector. In 2010, 17.4 percent of males compared to 23.7 percent of females were employed in the tourism trade (Aruba Demographics 2015).

Aruban women in 2014 never made more than a 78.1 employment percentage rate. This percentage includes women of all ages. Women aged 35–39 (78.1%) and 40–44 (78%) have the highest rates of employment among all women, while men aged 40–44 (87.2%) have the highest employment rate among men and women (CBS 2014b, 53).

In 2010, unemployment was lower among women than men across several age groups. Females in their teens and early twenties (46% and 21%, respectively) had a slightly lower unemployment rate compared to males (48% and 23%, respectively). During their childbearing and child-rearing ages of 25–44, more women, approximately 10 percent, were unemployed compared to approximately 9 percent of men. This reversed for women aged 45 and older, when Aruban women, about 7 percent, had a lower unemployment rate than men, about 8.7 percent, the same age (CBS 2014b, 53).

According to Aruban labor market data, women outnumbered men in education, sales and service, clerical workers, trade, real estate, public administration, and the restaurant and hotel sectors. For example, less than 3,000 men compared to nearly 5,000 women were employed in education. In service and sales, there are approximately 7,500 women employed and 5,000 men. In the hotel and restaurant industry, 4,000 men are employed and approximately 9,000 women. More women are in real estate and public administration, with over 8,000 employed in both industries, compared to more than 4,000 men in both industries (Aruba Demographics 2015).

Bonaire

Sixty-nine percent of the Bonaire population between the ages of 15 and 74 work. Seventy percent of the men work, while 65 percent of the women work. In 2014, the unemployment rate was 6.4 percent, or 700 people out of work, 337 males and 341 females. In the same year, the labor force was 10,637, and of this, 5,835 were male and 4,801 female (Statistics Netherlands 2016, 29).

Curaçao

The total employed population in Curaçao was 63,493 people; of these, 32,143 were women and 31,350 men. Conversely, at 3,671, fewer men (10.5%) were unemployed compared to 5,841 (15.4%) women (CBS 2013).

Approximately 1,500 Curaçao women earn a monthly income of 500 Antillean guilders (ANG) or less (USD\$280), while nearly 1,000 men earn this monthly income. More

men (14,692) earn ANG 3,001 (USD\$1,676) compared to women (11,377) (CBS 2013).

Saba

Sixty percent of women and men are employed on Saba. Although women (771) outnumber men (746) in terms of total population, more men (452) are employed than women (448). Many are employed by the government, in the tourism industry, in construction, in culture and recreation services, and in other business industries; this includes Dutch nationals who move to Saba (CBS 2015, 64–67).

Sint Eustatius

The labor force in St. Eustatius in 2014 totaled 2,240. More men worked in the technical industries than women, and more women worked in the service, health and welfare, and teaching areas. Fifty-five percent of women worked full-time compared to 68 percent of men. Sixty-five percent of women worked part-time versus 70 percent of men. Income garnered follows a person's age, typically, with younger people earning less and people earning more as they gain experience and better paying work (Statistics Netherlands 2016, 92–99).

Sint Maarten

Sint Maarten's employed population total for 2013 was 19,137. Of that number, 9,729 males (90.1%) were employed and 9,408 females (91.6%). The unemployed population of men was 1,067 compared to 866 women. The total unemployment rate was 9.2 percent. The men's unemployment rate was 9.9 percent compared to women's rate of 8.4 percent. Youth employment rate was 25.9 percent. Men in the age groups of 25–44 (397) and 45 and older (360) were the highest unemployed group compared to women 25–44 (325) and 45 and older (293). Women 25–44 years old were the highest unemployed in all age groups. The employment statistics included 15-year-olds (Department of Statistics of St. Maarten 2013).

The minimum hourly wage in Sint Maarten is ANG 8.56 (USD\$4.78). The monthly wage is ANG 1,483.73 (USD\$828.9). In 2013, women (789) earned a monthly income of ANG 500 (USD\$280) or less than men (580). More than 3,000 women earned ANG 1,001–2,000 (USD\$559.22–\$1,117.32) compared to 2,813 men. More women are in this income range than any other pay range, including the pay range of males (Department of Statistics of St. Maarten 2014).

Discrimination and Income Disparity

Dutch Antillean people face three times the unemployment rate of their white Dutch counterparts. The African Dutch Antillean is also discriminated against in employment and pay rates.

Health

Access to Health Care

Health care is accessed through a network of care facilities through private foundations and companies. Each island has a hospital, with those on Curaçao and Sint Maarten providing more services for which the smaller islands are not equipped. These are complemented by clinics, pharmacies, and nursing homes. Employees have access to health insurance whether in the public or private sphere. The Social Security Bank provides compulsory insurance for those working for private businesses (PAHO 2012).

Maternal

Maternal mortality rates were the same in 2015 for Aruba, Curaçao, and Sint Maarten. Rates fall into three categories for maternal mortality: high-income, middle-income, and low-income women. The rates are 496 for low-income, 180 for middle-income, and 10 for high-income (World Bank 2017). The higher-income Caribbean Netherlands women have the better chances of surviving childbirth.

Fertility rates

Aruba

In 2015, the fertility rate 1.84 percent (CIA 2017a). In 2014, Aruba had 1,376 live births. Of these, 725 were male, and 651 were female babies. The birth rate in Aruba in 2014 was 12.7 percent. Out of 100 girls' live births, Aruba had 111.4 male births. The number of births to single parents out of 100 was 65.7. The fewest live births were those women 15 years or younger as well as women 45–49 years old. Each group had 2 live births. The majority of women with the most live births were those ages 30–34 with 350 and 20–24 years with 343. Teenagers (ages 15–19) had 131 live births (CBS 2014b).

Curaçao

The mean age when Curaçao women had children increased from 27.2 (2001) to 28.2 (2011). This number includes all live births. The age a woman had her first child

decreased from 26.5 years (2001) to 25.8 (2011). In 2011, most children, 66 percent, were born into single-parent households compared to 58 percent in 2001. In the same years, 32 percent of children had married parents, down from 39 percent in 2001 (CBS 2011).

The total infant mortality rate per 1000 children in 2016 was 8.3 percent. More male children (9.1%) died at birth than females (7.6%) (CIA 2017b). Of the total live births in 2013, 987 were male and 972 female. Women younger than 15 years old had 3 births. Teenagers (ages 15–19) had 181, and women aged 25–29 had the most live births (491) for the year. Women aged 45 and older had 7 live births. The average age of the mother at the first child's birth was 28.9 years (CBS 2013).

Sint Maarten

The 2016 fertility rate is 2.06, with 8.3 deaths per 1,000 live births. For males, the infant mortality rate was 9.1 deaths per 1,000 births. For females, the number of deaths was 7.6 per 1,000 births (CIA 2017c).

In 2011, 93 girls ages 14–19 had more than child. In addition, approximately 700 women ages 25–29 had 1 to 10 or more children (Department of Statistics of St. Maarten 2014).

Contraception

Aruba

In 2014, 3,120 people registered in the Family Planning Foundation, 2,672 people visited the clinic, and 1,676 visitors were teens (less than 20 years old). Total new registrants for 2014 were 662. Of the total, 389 were teens, 49 males, 340 females, and 233 were adults (CBS 2014b).

In 2014, the Family Planning Foundation donated 35,500 condoms. Other types of contraceptives include 1,570 oral contraceptives, 636 injectable birth control, and 78 IUDs (CBS 2014b).

Curaçao

The Foundation for the Promotion of Responsible Parenthood distributed 28,812 contraception methods in 2013. Of the total varying types of birth control, 6,323 were the birth control pill. Approximately 18,000 condoms were distributed (CBS 2013).

Diseases and Disorders

Aruba

In the decade of 2010, 126 Aruban men 25–44 years old reported having HIV/AIDS. In the same age group and

decade, 45 women were reported acquiring the disease. In the age range 45–64, 50 men reported having HIV/AIDS compared 22 women. Therefore, Aruban men between the ages of 25 and 64 were more likely than women in the same group to contract the virus. In 2014, 24 males tested HIV-positive and only one female. Aruba did not have registered AIDS cases in this year (CBS 2014b).

Curaçao

In 2013, Curaçao had 122 newly registered known cases of HIV. Of those known, 76 were males and 46 females (CBS 2013). In 2015, Curaçao had 960 HIV-registered patients. In the same year, 171 patients died, 12 moved abroad, and 547 were in clinical care. Two-thirds of those infected contracted the disease through heterosexual intercourse (United Nations 2016).

Sint Maarten

In 2011, 18 newly registered HIV-positive cases were reported. Ten of the new cases were men, and the remaining were women. Each group of women between the ages of 20 and 24, 25 and 29, and 35 and 39 have two newly reported cases. These groups are the highest for all age sets. Men (40–44) have three newly reported cases (Department of Statistics of St. Maarten 2014).

The first Zika virus was identified in Uganda, Africa, in 1947. The first human case of the virus was in 1952 (WHO 2017). The virus made a recent appearance in Brazil in May 2015 (*Daily Herald* 2016b). In 2016, the virus appeared in Venezuela (WHO 2017). Saba's first case came in June 2016 (*Daily Herald* 2016a). By September, St. Maarten had 54 confirmed cases (SXM Talks 2016).

The virus is initially transmitted by an *Aedes* mosquito. The virus can also be sexually transmitted from the host to another. The infected person may experience mild to severe (paralysis) symptoms. However, this virus might not only affect the host; it can also cause birth defects in unborn children if a pregnant mother is infected (CDC 2017).

Family Life Marriage and Sexuality

Aruba

In 2010, 11,928 Aruban couples were married without children, and 38,343 couples were married with children. Nearly 25,000 children lived in a house with only their mothers. However, 2,131 Aruban children lived with only their fathers. Approximately 10,200 children lived with

both parents who were not married or were cohabiting. Some 3,466 couples cohabitated who did not have children (CBS 2010). In 2014, 617 couples were married. In the same year, 468 couples divorced, or for every 100 marriages nearly 76 couples divorced. In addition, 65.7 children out of 100 live births were born to a single parent (CBS 2014b).

Bonaire

Almost 42 percent of Bonaire's households were single. Fourteen percent of the population were unmarried couples. Bonaire had the largest population of married couples (29.1%) compared to Saba and Sint Eustatius. In January 2014, 12.51 children lived in a single-parent household (CBS 2015).

Saba

In January 2014, 52.11 percent of Saba households were single. Nearly 15 percent of households were made up of unmarried couples. Approximately 22 percent of the population was married. Despite the high number of single households, only 9.74 percent of the children lived in single-parent households (CBS 2015).

Sint Eustatius

Like Saba, on Sint Eustatius, slightly more than 52 percent of the population is single. More than 12 percent of the population lives as unmarried couples. Twelve percent of Sint Eustatius children live in single-parent households (CBS 2015).

Sint Maarten

Data from 2008 show that there were 232 marriages and 108 divorces in St. Maarten out of a population of about 39,000 (2012 estimate) (NationMaster.com 2003–2017).

LGBTQ

Same-sex marriages performed in the Netherlands are recognized and protected under the islands' laws; however, they are not performed in the islands. Protections in housing and employment are not secured, though same-sex activity is legal as is serving in the military. Except for Aruba and Bonaire, it is not legal for persons to change their gender, limiting the rights of transgender people (Equaldex 2017).

Politics

Aruba

Aruba is a country within the Kingdom of the Netherlands. The Queen of the Netherlands, Queen Maxima, appoints the governor for a six-year term. The prime minister is

the head of the country and is a part of a seven-member Council of Ministers. Parliament, which is the legislative part of the government, is made up of 21 elected officials (Aruba Travel Guide 2017). Of the 21 elected, 8 are women (CBS 2014b).

Curaçao

The Curaçao Parliament has nine seats. Three of the seats are held by women (CIA 2017b).

Saba

The island of Saba is a special municipality of the former Netherlands Antilles. The island is a part of the Kingdom of the Netherlands. Therefore, the King of the Netherlands, Willem-Alexander, is the head of Saba's government. The king appoints the island governor to a six-year term. The two other branches of Saba's government are the Executive Council and the Island Council. The Executive Council is appointed by the Island Council. The Executive Council includes the island governor and two commissioners. The Island Council is a five-member legislative body. Its members are elected by Saba islanders. The Island Council serves a four-year term. Of the five elected officials, one woman was elected to the council (Public Entity Saba 2017).

Sint Maarten

As with Aruba and Curaçao, Sint Maarten is an independent country within the Kingdom of the Netherlands. It has a Council of Ministers, which includes the prime minister and six additional ministers. Of the total seven ministers, one woman holds an office (Government of Sint Maarten 2017).

Judicial System

Prison

The Institute for Criminal Policy Research provided statistics of women in prison in Aruba, Sint Maarten, and Curaçao for 2014. The statistics were for one day in 2014; therefore, the numbers can only be an estimate of the number of prisoners in the institution.

Aruba

In Aruba, the female prisoner rate per 100,000 of the national population is 5.8. The number of women imprisoned fell from 23 in 2007 to 6 in 2014, which represented 3.5 percent of the total prison population. Aruba has only

one prison, Aruba Correctional Institution (Korrectie Instituut Aruba, KIA), in which men, women and juveniles are housed. The total capacity is 310 prisoners (ICPR 2014).

Curaçao

The prison population rate in the Curaçao Detention and Correctional Center (Sentro di Detenshori Koreshon Korsou, SDKK) is 225 per 100,000 of the national population. The total prison population is 348. The percentage of the total population who are women is 3.2 percent. The total number of female prisoners was 11 in 2014, a reduction from 41 women prisoners in 2007. As in Aruba, Curaçao has only one prison on the island to house women, men, and juvenile detainees (ICPR 2014).

The Netherlands 2015 *Human Rights Report* found that Aruba, Curaçao, and Sint Maarten had substandard conditions as a result of inadequate medical care, including mental and dental health facilities. In addition, all three prisons had reports of violence, intimidation among prisoners, prison staff mistreatment, and police abuse of detainees (U.S. Department of State 2015).

Sint Maarten

In 2012, Sint Maarten's prison population in Pointe Blanche was 180 out of the national population of 46,400. Sint Maarten has only one prison that houses juveniles, men, and women. The percentage of female prisoners is 5 percent. World Prison Brief (WPB) does not provide the total number of women detainees for 2007 or 2014 (ICPR 2014). As of 2015, Point Blanche is overcrowded due to renovations on the prison (U.S. Department of State 2015, 3).

Religious and Cultural Roles

Aruba and Curaçao are predominately Catholic, at 75 percent and 72 percent, respectively. Protestants make up less than 5 percent of the religiously affiliated persons on each island. At 6 percent, Pentecostal Curaçaoans is the next largest group. Those who claim no religious affiliation are 6 percent in Curaçao and 5 percent in Aruba (CIA 2017a, b; CIA 2017b).

Sint Maarten is primarily Protestant at 41.9 percent. Of these faiths, Pentecostals are the largest, at 14.7 percent, followed by Methodist at 10 percent, Seventh-day Adventist at 6.6 percent, and other faiths. Roman Catholics number the largest religiously affiliated at 33 percent. Like the other islands, Sint Maarten is predominately Christian; however, its diversity includes Hindus at 5.2 percent and

Muslim/Jewish at 1.1 percent. At 7.9 percent, the religiously unaffiliated also comprise a notable minority (CIA 2017c).

Bonaire, Saba, and St Eustatius are similarly religious; over 80 percent on each island identify as Christian, with Catholics being the most numerous. Christians on Bonaire, Saba, and St Eustatius number 70 percent, 40 percent, and 25 percent, respectively. Saba's diversity includes 6 percent Muslims, and at 18 percent, it has the largest group of the religiously unaffiliated. Overall, women on these islands, especially older women, tend to practice more than men. Additionally, those with the highest education levels tend to practice more (CBS 2014a).

Issues

Abortion

Curaçao

Although abortions in Curaçao are legal, the government's attitude is one of tolerance rather than support. The number of abortions per 1,000 women aged 15–45 was 38. Eleven of the 102 general practitioners on the island perform abortions (Boersma 2011). A study looked at Curaçao women's attitudes toward abortion and found a high incidence of unintended pregnancies. Factors contributing to the high incidence include a cultural norm where discussing sexuality is taboo, the transitory nature of some relationships, the cost of contraception, and a lack of knowledge about contraception. Fifty percent, or 60 of 120 respondents, reported not having reliable knowledge of contraception. Seventy-three of the women reported that they used birth control pills but believe that long-term use is harmful. Seventy-one of the Curaçao women have an experience using a condom. However, the reasons they gave for not using a condom included reduced pleasure and possibility of breakage. Forty percent of the women studied had had an abortion. Twenty-eight had had one abortion and 12 percent more than one abortion. The women reported that they had abortions between the ages of 15 and 41 (Van den Brink et al. 2011).

Bonaire, Sint Eustatius, and Saba

As of October 2011, abortion in the Bonaire, Sint Eustatius, and Saba (BES) islands became legal. However, at the time, no doctor on the island had applied for a permit to provide abortions. Despite this, Edith Schippers, the minister of public health, well-being, and sports, claimed that 50 percent of pregnancies end in abortion, indicating that doctors were quietly providing this service. To prevent

unintended pregnancies, BES's basic health insurance covers the contraception pill (Annemieke 2012).

Prostitution

The Dutch Caribbean has legal and regulated prostitution. This includes the islands of Sint Maarten, Saba, Sint Eustatius, Aruba, Bonaire, and Curaçao. According to a study, sex workers are required to take a weekly test for sexually transmitted diseases and a health screening. Women of lighter skin are imported into the region because the darker-skinned locals are considered undesirable to tourists. Therefore, women are permitted to enter the country on three-month prostitution visas. Unfortunately, the importation of sex workers leads to illegal sex trafficking. The victims of sex trafficking are often forced into prostitution to pay for their travel and boarding. Many of the victims are unaware that they will be sex workers (Walker 2012).

Trafficking

The Trafficking Victims Protection Act (TVPA) categorizes severe forms of trafficking as sex trafficking where a commercial sex act occurs by force, fraud, or coercion or to a minor. Trafficking also includes the recruitment, harboring, transportation, provision of, or obtaining of a person for labor or services through force or fraud for the purpose of involuntary servitude. The most susceptible persons to trafficking are children, those in the commercial trade, and construction workers. The U.S. Department of State categorizes trafficking by tier placements. Countries are placed in one of four tiers. Aruba and Curaçao are classified in Tier 2. Although they do not meet the minimum TVPA standards, they are progressing toward meeting those standards (U.S. Department of State 2016b).

In 2011, 4 victims were identified as victims of human trafficking for all of the Dutch Caribbean. Because all Dutch Caribbean victims are counted as coming from the same place, rather than by island, victims are difficult to identify (Maduro 2013). In 2013, 2 traffickers were sentenced and convicted. Aruba uses checklists to surface trafficking activity, but not always at the times when activity is likely to happen. Those at risk include women from other countries who work in the commercial sex trade and foreign men and women working in the construction and service industries (U.S. Department of State 2014). St. Maarten conducted its largest investigation into trafficking in 2015 and freed 14 sex trafficking victims and charged 6

defendants. Those most at risk for trafficking are women and girls from other countries (U.S. Department of State 2016a).

Sexual Violence

Curaçao

In 2011, 27 rapes and sexual assaults were reported in Curaçao. This number is down from 57 reports in 2010 (OSAC 2014).

Sint Maarten

On Sint Maarten, 13 rapes and 4 sexual assaults were reported in 2012. Four illicit sexual abuse occurred. Six rapes of girls between 12 and 15 years were reported. In addition, 4 rapes of girls younger than 12 years old occurred (Department of Statistics of St. Maarten 2014).

Domestic Violence

The Caribbean Netherlands has laws against domestic violence, all categories of rape, sexual harassment, and female genital mutilation (FGM). These crimes, except spousal rape and FGM, carry a fine and sentence of 15 years in prison. If convicted, the spousal rapist will serve an 8-year sentence. FGM, which is classified as a “harmful traditional practice,” has a 12-year maximum prison sentence.

Nicaragua

Overview of Country

Nicaragua is one of seven countries that form Central America. Costa Rica borders it to the south and Honduras lies to the north. It is the largest country in Central America, encompassing an area of 50,336 square miles (130,370 sq. km), which is slightly larger than the state of Pennsylvania (CIA 2015). The central interior of the country is mountainous, ascending to the highest point, Pico Mogton, at 7,998 feet (2,438 m). The Atlantic coastal plains region is extensive, while the Pacific coastal territory is narrow and interspersed with volcanoes. Located near the

border with Costa Rica, Lake Nicaragua is the largest fresh lake in Central America. Spanish is the official language of its more than 6 million inhabitants. The majority of Nicaraguans, 69 percent, identify as mestizo, of Amerindian and European descent (CIA 2015). The remainder of the population is composed of 17 percent white, 9 percent black, and 5 percent Amerindian (CIA 2015).

Three indigenous groups inhabited the area prior to the arrival of Europeans: the Niquirano, the Chorotegano, and the Chonta (Merrill 1993). Each had its own culture and language. The Spanish began colonizing Nicaragua in the 16th century, settling primarily in the western region. The English settled in the Caribbean coastal region. Nicaragua secured its independence from Spain in 1821 and established itself as an independent republic in 1838. The English continued to occupy the eastern region of the country until the mid-1800s. British interest in the country was its geographic location, which provided an important route for commercial transit. In 1860, under the Treaty of Managua, the British government ceded its control of the Miskito coastal region to Nicaragua (Sy-Wonyu 2005).

Throughout the 19th and 20th centuries, internal conflict persisted in Nicaragua. The initial unrest developed between liberals, primarily merchants and professionals, and conservatives, the landowners. Liberals wanted the city of León to be the country's capital, while conservatives pushed for Granada. In the end, Managua was chosen with the hope of subduing the conflict. In 1856, William Walker, an American, seized control of the government and became the first president of the country. He was ousted the following year, but the United States continued its presence in the country. U.S. Marines occupied Nicaragua from 1912 to 1933. For the next 40 years, Nicaragua was held under the control of the Somoza family, whose authoritative rule gave rise to more internal opposition.

Nicaragua's 1979 social revolution is the only one in that region. The Frente Sandinista de Liberación Nacional (FSLN, Sandinista National Liberation Front) overthrew the Somoza regime, drawing the attention of the United States and other international governments. The new leadership instituted widespread social, economic, and political changes. More conflict ensued as a new counterrevolutionary group gained force. The Contra War, in which the United States provided covert military assistance to the opposition military, dominated the nation throughout the 1980s. Pressured by the international community to hold democratic elections, FSLN representative Daniel Ortega won the presidency in 1984. In 1990, an opposition

coalition defeated Ortega, and Violeta Barrios de Chamorro became the first female president of Nicaragua.

Into the early 21st century, Nicaragua's internal politics have been contested nationally and internationally. Reports of widespread election irregularities dominated multiple elections, including the 2008 and 2012 municipal elections, the 2010 and 2013 regional elections, and the 2011 presidential election. In 2006, former Sandinista president Daniel Ortega was reelected president after losing the previous three elections. He was reelected in 2011, ignoring a constitutional ban on presidents serving consecutive terms in office.

Changes in Nicaragua's political landscape have affected domestic policies. In 2014, the government approved the construction of an interoceanic canal to rival the Panama Canal. Local residents who fear the environmental impact of the project will be detrimental to the area have challenged the decision.

Social programs in health, education, and employment enacted under the Sandinista government have suffered due to budget constraints. Nicaragua continues to struggle to provide its citizens with access to a standard of living that meets their essential needs. It is the second-poorest country in the region, behind Haiti (World Bank 2015). Even though the per capita gross domestic product (GDP) has been growing, from USD\$4.9 billion in 2014 to USD\$5.3 billion in 2016 (CIA 2017), 45 percent of the income goes to the wealthiest 10 percent of the population, and the poorest receive just 14 percent (UN Girls Education Initiative n.d.). Almost 43 percent of the population lives below the poverty line, and more than 80 percent of the poor population lives in rural areas where people have limited access to resources needed to improve their livelihood (CIA 2015). Life expectancy is 74.4 years, and the infant mortality rate is 21 deaths per 1,000 live births (World Bank 2015). In comparison to Honduras and El Salvador, two countries with similar population sizes, Nicaragua ranks lowest in expected years of schooling—10.5 versus 11.6 and 12.1, respectively. In 2013, Nicaragua's Human Development Index (HDI) was 0.614, a continuous improvement since 1980, but it remains the lowest among Latin America countries (UNDP 2014; *Eye on Latin America* 2014a).

Women have achieved success in organizing and raising awareness about the challenges they regularly confront due to gender inequality. However, they continue to struggle with access to health care and education as well as equality in the workplace, which is reflected in its Gender

Inequality Index (GII) value. In 2013, Nicaragua received a 0.458, ranking it 90th out of 149 countries (UNDP 2014). The Gender Gap Index, which measures gaps in access to resources and opportunities between women and men, ranked Nicaragua 12th out of 145 countries (World Economic Forum 2014). Nicaragua is the only Latin American country to be ranked in the top 20 of the Index.

Girls and Teens

According to the UN Development Programme (2014), Nicaragua's teen birth rate is 100.7 births per 1,000 for young women aged 15–19, and the rate of teenage pregnancy is one of the highest in the Western Hemisphere. Young girls in rural areas are more likely to become mothers during adolescence than those living in an urban environment. Approximately 42 percent of Nicaragua's population lives in rural areas, where there are higher rates of poverty (UNESCO 2012). In these areas, 7 of every 10 people are low-income, and 3 of every 10 children are undernourished (PAHO 2007). Because of poverty and lack of education, many young women, especially in marginal urban and rural areas, have low self-esteem, no future expectations, and nothing else to do except have a baby.

Recent statistics indicate that 62 percent of women had given birth before the age of 20 (Guttmacher Institute 2008). A 2006 report found that 11 percent of Nicaraguan women had become sexually active before the age of 15 (Guttmacher Institute 2006). The Ministry of Health reported that, from 2000 to 2009, the number of births to girls aged 10–14 increased by almost 50 percent (Amnesty International 2014). Girls who become pregnant are expelled from school, thus decreasing their opportunity to continue their education. Sexual education is prohibited in schools, and abortion is illegal; both contribute to Nicaragua's relatively high rate of teen pregnancy.

Sexual violence against girls and young women is high. According to official police statistics, in the first half of 2012, the Police Unit for Women and Children reported 1,862 cases of sexual violence. Children 14 years old or younger were 1,048 of the victims, and 80 percent of the victims were 17 years old and younger (Amnesty International 2013). In 2013, the Instituto de Medicina Legal, the national agency responsible for investigating violent crimes, reported 6,069 sexual violence offenses. Of these offenses, 88 percent of the victims were female. The highest number of victims were girls aged 13 or younger, 42 percent, 2,537 cases, followed by girls aged 14–17 at 30

percent, 1802 cases (Corte Suprema de Justicia 2013). More victims are reporting offenses to authorities, but rape and sexual abuse are typically underreported crimes; thus, the actual number of girls and young women who are victims is unknown.

Under Nicaraguan law, statutory rape is defined as sexual intercourse with a child under the age of 14, but the law is not enforced. In many cases, the perpetrator is a relative, and victims fear speaking out against the individual. In 2010, Amnesty International completed an in-depth report focusing on personal interviews with victims of sexual violence. In it, victims stated they often did not report sexual abuse because the perpetrator was a known relative (Amnesty International 2010).

The primary reasons for maternal morbidity, illness, or mortality among pregnant young women are suicide or attempted suicide and complications during pregnancy, childbirth, and puerperium (six weeks after childbirth when the uterus returns to normal size). Domestic and sexual violence, injury, and poisoning were other named causes. Adolescents aged 15–19 caused an estimated 32 percent of self-inflicted injuries (meaning intentional self-harm) (PAHO 2007). Of all the deaths classified as maternal mortality, one-third occurred among adolescent girls (2012).

Nicaragua is a signatory on the UN Convention on the Elimination of All Forms of Discrimination against Women (CEDAW). That agreement obligates the country to provide equal rights and opportunities to men and women in sports, physical education, and recreational activities. But according to studies, Nicaraguan girls and young women are not encouraged to participate in sports. In fact, they often confront barriers to playing sports and physical activity. Outside of physical activity mandated at schools, only a small percentage of girls participate in sporting activities, either formal or informal, while the majority of boys do (Rock, Valle, and Grabman 2013, 51). Nicaraguan girls receive less support from their families, confront more safety issues when playing sports, and are subjected to gender stereotyping regarding physical activity (52). A lack of physical activity can lead to more health risks and illnesses in females, such as obesity, diabetes, and cardiovascular disease. The Nicaraguan government has passed laws to promote equal opportunity for females to participate in physical activity and receive equal treatment. A lack of opportunity still needs to be addressed, and more government initiative is needed to create and promote physical activity and sports participation so

Women's Voices

Lucía Robelo

My name is Lucía Robelo. I grew up in Nicaragua during the times of the last Somoza Regime, in the 1960s.

Censorship was widespread. *La Prensa*, the only opposition paper, was repeatedly closed down and imposed a hefty fine before it could be reopened, just for reporting the truth. Readers deposited a contribution to pay for the fine in a bank account opened up for that purpose. A few days later, *La Prensa* was up and running again.

Jokes circulated about how dumb Somoza members of the *Guardia Nacional* were and how dumb Somoza himself was (“Tachito”). The truth is the *guardias* were poor and hungry, and corruption was only natural.

Carrying a gun gave these *guardias* a sense of power without responsibility or consequence. “Accidents” happened often. My own brother fell victim of an accidental bullet from a drunk *guardia nacional*’s rifle when the *guardia* started shooting in midair at a local patron saint’s celebration in Managua. These kinds of deaths were common occurrence. My brother was only 18.

Orejas were also common—nonmilitary spies for the regime. The expression *las paredes hablan* (walls can hear you, and they will speak up) was used to hush someone when talking about politics in private conversations. You never knew who to trust.

Those were really repressive times.

One of the jokes went something like this: A drunkard was apprehended for yelling in the middle of the street: “Death to the most corrupt president of the Central American nations!” The *guardias* soon came to apprehend him by saying, “Come on, you are going to jail.” The drunkard said, “But I have not even said who it is!” To which the *guardias* quickly replied (and this was the punch line), “And who else is it gonna be? Come on, let’s go to jail.” Humor was a way to numb the general feeling of powerlessness and the pain about the *desaparecidos* that dominated the times.

I have lived in the United States for several decades. But I am not sure I have ever overcome that sense of fear about speaking up about issues that I learned when I was growing up in Nicaragua.

Nicaraguan girls can maintain a healthy lifestyle and achieve genuine equal access (57).

Education

The Ministry of Education manages the educational system. According to the constitution, education is a basic universal human right. Prior to 2007, the country had an Autonomous School Model. Under that model, school control was decentralized, and local councils composed of parents, school principals, teachers, and students were responsible for the decisions regarding the academic and material realms of the school (King, Özler, and Rawlings 1999, 3). Since then, the government has prioritized free access to education for all Nicaraguan children and has taken steps to monitor the education system rather than have it be under the authority of local units. Current education officials have criticized the previous autonomous system for its lack of monitoring educational funds (Visser-Valfrey et al. 2010, 20).

The school year runs from January to December, and education is compulsory from ages 6 to 12 (Education Policy and Data Center, 2012). The government spent 4.5 percent of its GDP on education in 2013 (CIA 2014). Teachers in Nicaragua earn 10–25 percent less than other comparable professional or technical workers (Bruns and Luque 2014, 86).

Students enter primary school at the age of 7, and enrollment is for 6 grades. Secondary school is divided into lower secondary, consisting of grades 7 to 9, and upper secondary, consisting of grades 10 and 11. In principle, one year of preprimary, primary school, and secondary school are free and compulsory; however, schools require uniforms and charge fees for books and materials, which families are expected to pay. Such costs can lead to students dropping out of school early. Eighteen percent of children of official primary school age are not enrolled in school, and a majority of these students, 28 percent, reside in rural areas. For secondary school, 43 percent of students are out of school, and 60 percent of these students live in

rural locations (Education Policy and Data Center 2012). Critics of Nicaragua's educational system say that classroom instruction often promotes gender stereotypes in the country and subordinates women in Nicaraguan society (IPS News 2010).

The literacy rate, or those aged 15 and older with the ability to read and write, is 82.8 percent in Nicaragua. For women, the estimated literacy rate as of 2015 is 83.2 percent, slightly higher than for men at 82.4 percent (CIA 2015). Nicaragua has one of the highest dropout rates in the region. In 2009, the dropout rate was 52 percent, substantially higher than Guatemala, 35 percent, and Honduras, 24 percent (UNESCO 2012). In 2011, only 55.2 percent of girls completed their primary education. In addition, girls' transition from primary to secondary enrollment dropped 2.8 percent in the same year (Education Policy and Data Center 2012). The mean years of schooling for women ages 25 and above is 6.2 compared to 5.8 for males of the same age population (UN Women 2015). The lack of completion among early years of schooling continues for girls, which limits their ability to access higher education. Reasons for dropping out include pregnancy as well as fulfilling family expectations, such as care of younger family members or helping with household chores.

The National Council of Universities (NCU), a separate entity from the National Ministry of Education, governs higher education and technical education. The NCU is primarily responsible for enacting higher-education policy in Nicaragua as well as approving the creation of new universities and vocational colleges and disseminating funds directed to higher education. In 2001, only 6.4 percent of the female population achieved higher education (WHO 2015). That rate increased to 19 percent, showing strong growth, compared to men at 17 percent (*Eye on Latin America* 2014a). However, only 5 percent of teen girls living in rural areas attend university (PAHO 2007).

Health

In 2013, the average life expectancy for women was 78 years, a consistent increase since 2001 when it was 73. For men in 2013, the life expectancy was 72 years. The five leading causes of death among Nicaraguans are malignant tumors, cerebrovascular diseases such as atherosclerosis, heart disease, diabetes, and chronic kidney failure. Men suffer from these conditions at a higher rate, 51 percent, than women. Among women, cancer-related deaths have become a health concern. In 2011, 1,671 women died from

some form of cancer. The most frequent diagnosis was cervical cancer, 22 percent, or 374 deaths (PAHO 2012). Female deaths from breast and liver cancer followed with 11 percent each of all cancer-related mortalities. Ten percent of women died from stomach cancer (PAHO 2013).

Access to Health Care

Health care is mainly provided by the Ministry of Health (MINSA) and is financed by taxes. About 70 percent of the population is covered by MINSA (Sequeira et al. 2011). Under the Ortega administration, the government restored the right to free universal health care (IMF 2011). The Nicaraguan Social Security Institute (INSS) finances health care for about 10 percent of the population employed in the formal sector (jobs of 40 hours per week that pay regular wages). A small percentage of people purchase private insurance. In 2013, while the government spent 8 percent of its GDP on health expenditures, an estimated 35–40 percent of people did not have health care services (Sequeira et al. 2011). Residents in rural areas, where people are scattered and the availability or use of services is low, suffer from the lowest levels of health care coverage (Doctors for Doctors n.d.). For example, in Nicaragua's Caribbean region, which covers approximately 55 percent of the country's territory, there are only three hospitals (Sequeira et al. 2011). As of 2013, there was just one physician per 1,000 people in Nicaragua.

Maternal Health

Nicaragua's estimated fertility rate is less than 2 children per woman, a decrease since 2001, when the rate was 3.2 (CIA 2015; PAHO 2007). The total fertility rate decreased from 3.6 children per woman in 1998 to 3.2 in 2001, though this differed based on income. Women with the lowest incomes had a higher actual fertility rate than their desired fertility (5.5 actual versus 3.8 desired) than women with high incomes (1.7 actual versus 2.5 desired) (PAHO 2007).

The maternal mortality rate is 95 per 100,000 live births. Postpartum hemorrhage is the leading cause of maternal mortality, accounting for 48 percent, followed by puerperal sepsis, 15 percent, and eclampsia, 14 percent. Several factors were associated with maternal mortality; they include high fertility, short birth spacing, limited coverage and quality of prenatal care, less attendance at birth, and less care for complications. Maternal mortality rates remained high in rural areas and in areas with limited access to

health care, low educational attainment, and high poverty (PAHO 2007).

Recent UN data indicate more women use contraception to prevent pregnancy. In 2015, 75 percent of women reported using a modern form of contraception, an increase since 1993, when less than 45 percent of women indicated doing so (USAID 2016). Contraceptive options include the contraceptive pill, intrauterine devices (IUDs), injectables, and male condoms (SWISSAID n.d.; USAID 2016).

Diseases and Disorders

Nicaragua has a low rate of HIV infection, and in 2010, estimates of adult prevalence of the disease was about 0.2 percent, or about 7,700 people living with the disease (Espinoza et al. 2011). Unfortunately, the number has been increasing. In 2001, there were 3700 reports of HIV cases, which increased to 7,700 in 2010 (Colasanti et al. 2013, 16). Experts believe that Nicaragua's isolation due to the 1980s economic blockade, low HIV infection rates among drug users, a controlled sex trade, and a ban on the sale of blood have contributed to the low infection rate. Those most at risk for contracting HIV are men who have sex with men. However, over the past few decades, the infection rate among women has increased sharply. The Nicaraguan National AIDS program now includes "housewives" as well commercial sex workers as at-risk groups (Colasanti et al. 2013, 16).

The challenges for women to prevent infection involve confronting their partners about HIV and safe sex in a culture where machismo, or male dominance and superiority, still thrives. Furthermore, social stigmas and discrimination of homosexuals and people with HIV contribute to Nicaraguans not getting HIV tested. The government has taken steps to increase HIV diagnosis by decentralizing the administration of rapid HIV tests.

Employment

Over the years, Nicaraguan women's participation rate in the labor force has grown almost 13 percent, from 35 percent in 1990 to 47.9 percent in 2013. Male participation rates decreased from 83.1 percent to 80.3 percent during the same time. The unemployment rate for women aged 15 and older was 7.5 percent in 2013 and 7.0 percent for men (UN Women 2015). The government has adopted policies banning gender discrimination and sexual harassment in the workplace. Employers must also provide at least 12 weeks of paid maternity leave.

Women work in the agriculture, service, and industry sectors. The percentage of women in the service sector decreased slightly, from 39.5 percent in 1993 to 36.1 in 2009. Conversely, female employment in agriculture has grown slightly, from 6.9 percent in 1993 to 10.3 percent in 2009. Female employment grew in the industry sector; in 1993, women's employment was 13.1 percent, and by 2009, it was 15.1 percent (ECLAC 2015b). One area where women dominate in employment is in the export-processing zones (EPZs). More than 75 percent of women are employed in EPZs as opposed to men (UNIFEM 2008).

EPZs are business areas formed to promote commercial and industrial exports. The majority of EPZs in Nicaragua are in the garment production industry, accounting for approximately one-third of the country's exports (Frederick, Bair, and Gereffi 2015, 409). These zones are excluded from environmental and labor regulations, and accountability and grievance procedures remain concealed (UNIFEM 2008). The increase of EPZs in the apparel industry has been attributed to the Central American Free Trade Agreement (CAFTA), which allows "duty-free access to the U.S. market" (Frederick, Bair, and Gereffi 2015, 404). Less than 15 percent of the total employees in EPZs are male (UNIFEM 2008). Low wages and employment violations have characterized labor practices in EPZs (McCallum 2011).

Women typically earn less than men, have less job security, work longer days, and are often concentrated in temporary work and home-based subcontracting (PAHO 2007). Regardless of schooling, women on average earn less than men. According to the Economic Commission for Latin America and the Caribbean, for every USD\$100 earned by a Nicaraguan man, a woman only earns USD\$89.70 (ECLAC 2015b).

Nicaraguan women led the movement for workplaces to adopt guidelines known as "Employment Yes, but with Dignity," which encourages employers to treat women equally in the workplace. Unfortunately, following them is voluntary, and women often accept poor working conditions and bad wages, despite the code's specifications. Women workers have complained that employers have not met the guidelines, and so they continue to contend with low wages, lack of child care, and unsafe late-night commutes from the work to home. Some changes have occurred in the working environment, such as more fresh air and light, a cleaner workplace, and emergency exits (UNIFEM 2008).

Women's employment in the informal sector is higher than men's. Informal-sector work includes unpaid care

and domestic work, such as housework (preparing meals and cleaning); care of people (children, the sick, people with disabilities, and the elderly); collecting water and fuel; and voluntary work in the community. Women spend approximately five hours a day on domestic work activities and care of people in comparison to men, who spend less than 50 minutes per day (UN Women 2015).

As part of its antipoverty program, the Nicaraguan government instituted the *Hambre Cero* (Zero Hunger) program to help women who work in the agriculture sector. The program provides rural women a production package, which includes animals and seeds, materials, technical training, and a savings program. Between 2007 and 2010, the program provided funds for 59,755 rural women and their families (Hoyt n.d.).

Women living in rural poverty often migrate when seeking employment. These internal migrants tend to stay close to Managua and other urban areas to take advantage of work opportunities as domestic servants and other jobs in the informal sector (PAHO 2007). Women leave behind their families, often children, in the hope of earning enough money to better support them. Nicaraguans who migrate abroad primarily go to Costa Rica or the United States. In 2001, more Nicaraguans reported having relatives in Costa Rica than the United States, 55 percent compared to 36 percent, respectively (Hobbs and Jameson 2012, 2454). For poorer Nicaraguans who want to leave their homeland, Costa Rica is a low-cost, accessible option and involves less risk. Nicaraguans with financial means migrate to the United States. For many women, Costa Rica is a more viable option than the United States. Although data is scarce on female migration, studies show that women were 46 percent of those who applied for migration amnesty in Costa Rica; they tend to be from rural, poor households, with little education, and are under the age of 15 (D'Angelo and Marciacq 2002).

Land Rights

Under the Sandinista government, large land properties were expropriated and redistributed as cooperatives and to individual landowners as small landholdings to create state farms to produce foods for domestic consumption. The Chamorro government attempted to recognize individual property rights while protecting the rights of land recipients under the social changes instituted by the Sandinista government. Land rights continue to be an important issue where 9 percent of landowners control 56 percent of

the farmland and where 61 percent of the smallest farmers hold only 9 percent of the land area. The government has made progress to improve women's access to landownership. Under the law, women have equal access to inherit, own, and manage financial assets. However, Nicaraguan customs continue to give men control over land and its use (USAID 2011). In addition, women without landownership struggle to obtain credit and often have difficulty claiming their rights.

Women's organizations have tried to fill the need for land equality in Nicaragua. The *Fundación Mujer y Desarrollo Económico Comunitario* (FUMDEC, Women and Community Economic Development Foundation) is one local nongovernmental organization (NGO) dedicated to improving women's access to land and developing their agricultural skills and knowledge. According to FUMDEC, by owning property, a business, or any type of asset, women then hold power to negotiate and have confidence to play an integral role in improving their livelihood (Pena, Maiques, and Castillo 2008, 65).

Family Life

The importance of family is apparent in Nicaragua. In fact, Chapter IV of the National Constitution states, "The family is the fundamental nucleus of society and has the right to protection by society and the State" (World Family Declaration n.d.). By law, women must be at least 18 to marry without parental consent, and men must be 21. But, a 14-year-old female can get married with parental authorization. For males, the minimum age is 15 (UNICEF 2016).

The importance of family that is recognized by Nicaraguan law is often not evident in the actual home. The number of female heads of household has grown. In 2003, 39.1 percent of the nation's urban households had a female head, an increase of almost 6 percent since 1993 (CEPAL 2007). Scholars contend that *machismo* is one factor contributing to the high rate of female households. *Machismo* includes womanizing, gambling, drinking, and other acts of independence, regardless of marriage status or fatherly expectations (Hagene 2010, 31). Many Nicaraguan women are expected to accept such behavior by their husbands or the fathers of their children without protest. In addition, women in such situations cannot depend on men for economic survival. In these situations, the woman is the sole provider for the family's economic and emotional well-being (31).

LGBT Rights

In 1992, the Nicaraguan National Assembly passed what was called “the worst anti-LGBT legislation in the Americas” (Kampwirth 2014, 323). During Violeta Chamorro’s presidency, the National Assembly passed Article 204 that criminalized sexual activity between persons of the same sex and legally sanctioned sexual practices related to procreation (Babb 2003, 309). Although the penalty of one to three years in prison was not regularly enforced, the threat was apparent. The ruling ignited an opposition movement by gay and lesbian groups protesting the law. In 2007, when FSLN regained control of the government, leaders revised the Penal Code, Article 204 was eliminated, and the government approved a series of articles that banned discrimination based on sexual orientation (Kampwirth 2014, 324).

Women have been recognized as the most active leaders for LGBT rights in Nicaragua. During the 1990s, AIDS-related NGOs, such as Nimehatzín and Xochiquetzal, and feminist NGOs, such as Puntos de Encuentro, founded by women, dedicated their work to demanding equal rights for gays and lesbians (Babb 2003, 310). LGBT groups such as these were key players in the country’s adoption of a Gay Pride celebration, held every June. However, LGBT families have yet to achieve the same equal rights as opposite-sex families. In 2012, the National Assembly proposed a Family Code that excludes families headed by an LGBT couple (Kampwirth 2014, 330).

Politics

Nicaraguan women have made strides in the political arena. The country is divided into 17 political and administrative departments. Unlike neighboring countries—Honduras and Costa Rica—voting is not compulsory in Nicaragua. The minimum age to vote is 16, and women won the right to vote in 1955. In the 2011 parliamentary election, voter turnout in the country was 79.09 percent (International Institute for Democracy and Electoral Assistance 2011). The Nicaraguan government has instituted quotas for women’s political representation. The goal of these quotas is to promote gender balance within political positions.

A 2000 Electoral Law requires political parties, or a coalition of parties, that participate in the National Assembly elections to include 50 percent men and 50 percent women candidates in their electoral lists. The percentage of seats occupied by women grew from 15 percent in 1990 to 21 percent in 2011 (ICPD 2012). Nicaragua has a “closed-list”

system for its unicameral Parliament (Htun 2007). With a closed-list system, a person votes for a party list, and party leaders determine the order in which candidates are listed. This system tends to elect more women than open-list systems, where a person votes for an individual candidate (Htun 2007). According to Nicaraguan law, candidate lists must alternate between male and female candidates. In 2011, of the 92 seats in the Nicaraguan Parliament, women held 37 (Quotaproject 2011). This rose to 42 in 2013.

There are three main political parties in Nicaragua—Frente Sandinista de Liberación Nacional (FSLN, Sandinista Front for National Liberation); Partido Liberal Constitucionalista (PLC, Liberal and Constitutionalist Party); and Alianza del Movimiento Renovador Sandinista (MRS, Sandinista Renovation Movement). Each party has instituted quota provisions for female representation. The FSLN holds 40 percent of the candidate list, the PLC has a combined quota of 40 percent of women and youth representation, and MRS has a quota of at least 40 percent women on its candidate list (Quotaproject 2011).

With the quotas for female participation, the percentage of women elected nationally has changed over time. In the 1990 and 1996 elections, 17 percent and 11 percent, respectively, of the deputies elected were women (Clulow 2005). By 2016, women held 45 percent of the national assembly’s seats (Inter-Parliamentary Union 2016).

Women have had more success winning mayoral and city council elections. In 2013, 40 percent of Nicaragua’s mayors and 24 percent of the city councillors were female (ECLAC n.d.). Newly elected female politicians often need guidance to face the challenges in their positions. International NGOs, such as UN Women and the National Democratic Institute, have been integral to helping women gain these skills (NDI 2013).

Religious and Cultural Roles

The Catholic Church plays an important role in Nicaraguan life and politics. In 2005, 58.5 percent of the population followed the Roman Catholic Church (CIA 2015). The illegalization of abortion is a direct example of the influence of the Catholicism in the country. Prior to a widespread 2006 publicity campaign by the church pushing for the illegalization of “therapeutic abortions” (ending pregnancies resulting from rape or where women’s lives or health are in danger), the National Assembly allowed them if three specialists from the Ministry of Health and the woman gave their consent (Human Rights Watch 2017).

Protestant religions are starting to attract followers in Nicaragua. In 2015, 23.2 percent of the population identified as Protestant; the majority identify as Evangelical, 21.6 percent (CIA 2015). In 1993, 17.3 percent of the population identified as Protestant (Hallum 2003, 173). Factors contributing to the growth of Evangelicalism include the personal relationship followers have with the pastor, the intense study of the Bible, and the strict moral code (Pisani, Pisani, and Duncan 2001, para. 44). The combination of the faith's moral code (no smoking, drinking, dancing, swearing, gambling, or extramarital sex) and the requirement that spouses be faithful and financially responsible have improved the socioeconomic environment for Nicaraguan women whose families have converted to Evangelicalism (Pisani, Pisani, and Duncan 2001, para. 46).

Although divorce is legal, 44 percent of Nicaraguans say divorce is morally wrong. Among those who identified as practicing a particular faith, 53 percent of Protestants and 38 percent of Catholics agreed that divorce is morally wrong (Pew Research Center 2014a, b).

Nicaraguan women are actively involved in their communities. As the Sandinista movement grew during the 1970s, female supporters of the revolution formed the first women's organization in Nicaragua, the Association of Nicaraguan Women Confronting the National Problem (AMPRONAC) (Isbester 2001, 5). Since then, women have been able to create feminist organizations separate from the revolutionary movement. One example is the Matalgalpa Women's Network, which began in 1992 and considers itself completely autonomous and without affiliation to any church, political parties, or related groups. Women's organizations have focused on promoting citizenship and sexual rights and stopping violence in the country.

After the Sandinista movement gained control of the country in 1979, the new government did not take aggressive steps to change the status quo for women's rights (Daniel 2000, 20). Cuts in social services made by post-Sandinista government officials forced women to choose between community involvement and seeking employment. In addition, a growing antifeminist movement spread in Nicaragua, garnering support from powerful groups such as the Catholic Church, Evangelical churches, and state agencies such as the Ministries of Health and Education (Kampwirth 2011, 10).

Recently created government programs have relied on women's participation to accomplish their goals. They include Programa Amor (Program Love, emphasizing the importance of early childhood encouragement); Agua

Segura (Safe Water); and Plan Parto (Plan Pregnancy) (Neumann 2013, 804). Programs like these focus on important challenges that many Nicaraguan women confront daily. Women continue to carry the primary care for their families, child care, cooking, and the like, and they struggle to balance both. For many families, mothers tend to rely on their daughters to absorb household obligations. Opponents have argued that government programs such as these contribute to the deeply rooted gender roles in which community work is considered "women's work" (Neumann 2013, 807).

Issues

Racism

Racism is not typically discussed in Nicaraguan culture. People engaging in racist behavior are considered "barbaric," and discrimination of others because of their differences is viewed as offensive (Kain 2006). Nonetheless, racism does exist. The black and indigenous populations, 9 percent and 2.2 percent of the total population, respectively, have been the victims of racism (CIA 2015). Insufficient data has been collected about black and indigenous populations, in part because of their relatively small numbers. Both groups primarily reside in the Atlantic coastal region of the country, colonized by the British, which is relatively isolated from the western region's metropolitan areas. The Afro-Nicaraguan population is mainly descendants of slaves brought to the country to work in agriculture. The country's indigenous populations have been driven from their lands and forced to work for international companies seeking to exploit Nicaragua's natural resources.

The remote locations of Afro-Nicaraguan and indigenous communities have led to marginalization and limited access to basic social services. The Miskitos, the largest indigenous population in the country, suffer from high rates of illiteracy and alcoholism. Access to health care is limited. Doctors usually originate from the western region of the country and are unable to communicate with local residents because of language barriers. Similar challenges are evident in education, where bilingual education is limited and residents feel their language and culture are marginalized in the classroom (Kinney and Norris 2013). Although the law prohibits discrimination, Afro-Nicaraguans and indigenous people are paid a lower rate and are not offered employment because of their lack of Spanish (Kain 2006).

Both groups seek to improve their present circumstances through civic engagement and developing programs to fight against racism, discrimination, and exclusion. In fact, the Miskitos succeeded in creating its own local political party—YATAMA (meaning “sons of mother earth” in the Miskito language) (Kinney and Norris 2013). The party is not recognized at the national level.

Violence

Violence against females continues to be a serious concern; domestic and sexual violence are the most frequent violations of women’s rights. In 2007, estimates found that 30 percent of women between 15 and 49 years old had been physically abused by their partners (PAHO 2007). Femicides, or murders of women at the hands of men, are numerous, and according to reports, there were more than 700 femicides committed in 2012, making the rate of women’s deaths at the hands of their intimate partners or former partners 64 per 100,000 inhabitants (Witte-Lebhar 2012; ECLAC 2015a). This high rate of violence against women compelled the government to take steps to prosecute offenders and protect women.

The National Assembly passed Ley 779, *Ley Integral contra la Violencia hacia las Mujeres* (Law 779, Integral Law against Violence against Women) (Asamblea Nacional 2012). In it, the government defines *femicide* as a form of gender-specific abuse that is distinct from “normal” homicide. The law provides sentencing guidelines for offenders and makes it a crime to not report cases of violence, including sexual abuse (Witte-Lebar 2012). Unfortunately, the government has not appropriated sufficient funds to enforce the law. The law explicitly states that new judges be assigned to handle Law 779 cases, and the Public Ministry contends that it will need to hire new prosecutors and create offices to assist victims of gender-based violence (Witte-Lebar 2012).

Nicaraguan women’s groups have praised the approval of Law 779, but they, along with international human rights groups, such as Amnesty International, condemned the government’s failure to enforce the law. In 2013, the government took steps to weaken Law 779. The National Assembly voted to retract the part of the law that bans mediation that could lead to women being subjected to further abuse by their accusers (Konczal 2013). The ban also allows accusers of certain crimes to be allowed mediation rather than face criminal prosecution (Amnesty International 2013).

Abortion

In 2006, the National Assembly banned all forms of abortion in Nicaragua, making it the only Latin America country with a blanket abortion ban. Supporters of the ban include the Catholic Church; Daniel Ortega, the president of Nicaragua; and members of the Ortega administration, who state that, according to government statistics, prior to the ban very few abortions occurred in the country. Nicaraguan women’s groups such as the *Movimiento Autónomo de Mujeres* (Autonomous Women’s Movement) vehemently oppose the ban and have gathered signatures of fellow opponents to challenge the law (Getgen 2007). External pressure from international organizations such as Amnesty International, Human Rights Watch (HRW), and the UN Office of the High Commissioner for Human Rights on the Nicaraguan government to relax the ban has made little progress. Under the ban, women as well as health care practitioners are subject to lengthy prison sentences. The law also forbids providing medical treatments to pregnant women that may inadvertently terminate a pregnancy (Witte-Lebhar 2010). The law does not provide options for girls and women who became pregnant due to rape or incest. Opponents of the ban insist that Nicaraguan women will suffer from serious mental anguish as well as physical harm that may result in death.

O

Organization of Eastern Caribbean States (OECS)

Overview of Country

The Organization of Eastern Caribbean States (OECS) was established on June 18, 1981, when seven Eastern Caribbean countries signed the Treaty of Basseterre. OECS members are Antigua and Barbuda, the Commonwealth of Dominica, Grenada, Montserrat, Saint Lucia, Saint Kitts and Nevis, and Saint Vincent and the Grenadines. Anguilla and the British Virgin Islands (BVI), both British Overseas Territories, are associate members (OECS 2016).

The OECS mission outlined in the Treaty of Basseterre is to encourage regional and international cooperation among member states, promote unity and solidarity, advocate for the regional recognition of international law, and increase economic integration among member states. In the 1970s, the regular members agreed to enter a formal arrangement to meet these goals—particularly of achieving economic development—to compensate for their smaller populations and physical sizes.

The OECS Central Secretariat is located at Morne Fortune, Castries, Saint Lucia, and is headed by the director general. OECS member states share a common currency, the Eastern Caribbean dollar (ECD\$2.70 = USD\$1). The Eastern Caribbean Central Bank acts in an administrative capacity over

the organization's currency for the seven OECS governments and the government of Anguilla; the British Virgin Islands uses the U.S. dollar as its currency (OECS 2016). The OECS is composed of physically small member states.

The total population of the OECS on January 26, 2017, is 680,079 (Worldometers 2017), with a national breakdown as follows:

- Antigua and Barbuda: 93,266, with 52.63 percent female
- Dominica and Grenada: 73,353 and 107,850, respectively, with female populations at 49.53 percent and 49.39 percent, respectively
- Saint Kitts and Nevis: 56,780, with 50.01 percent female
- Saint Lucia: 187,768, with 51.26 percent female
- Saint Vincent and the Grenadines: 109,788, with 49.2 percent female
- Anguilla: 14,906, with 52.06 percent female
- The BVI: 31,200, with 52 percent female

Montserrat has the lowest population in the OECS at 5,168, as of January 26, 2017, largely due to the eruption of the Soufriere Hills volcano that began on July 18, 1995, causing two-thirds of the inhabitants, approximately 8,000 people, to immediately evacuate the island. Females comprise 50.01 percent of Montserrat's population. On average, the female population of the OECS is 50.77 percent of the entire population (CIA 2016).

Ethnicity in the OECS is on average 84.89 percent black or of African descent, except for Saint Kitts and Nevis (CIA 2016). The population is largely descended from African slaves, with only a small portion on some islands representing the Amerindian population, mixed-race individuals, and other ethnic groups, including European Caucasians. Dominica and Saint Vincent were home to the Garifuna, a people of Kalinago and African descent, until their forcible removal to the island of Raotán and eventual migration to the Central American coast (Shepherd 1999, 17). The major religious groups in the OECS are Protestant, comprising 75.32 percent of the population; in Saint Kitts and Nevis, Anglican is the largest Protestant group. The next most populous religion in the OECS is Roman Catholicism.

Girls and Teens

Antigua and Barbuda

The government of Antigua and Barbuda charged Lebrechtta Nana Oye Hesse-Bayne with producing a document outlining the nation's 20-year adoption of the Beijing Platform for Action (BPfA). The document outlined six vulnerable factors, two of which affect girls and teens. Girls have the greatest opportunity for success if they obtain a strong educational background, which is only possible with support from their immediate or extended families. Yet, the BPfA-based report notes that of the twelve critical areas of concern, "the girl child" remains a category of "moderate progress" (Hesse-Bayne 2014). This statement suggests that, despite the progress that has already been made toward improving the lives of girls in Antigua and Barbuda, there is still much to be done. Young single mothers can be at an economic disadvantage if they do not receive familial or state-sponsored support. Of these forms of support, familial may be more helpful, as it typically involves finances, emotional support, and child care.

Dominica

Some gender-based issues disproportionately impacting girls and teens in Dominica are discrimination, an inadequate juvenile justice system, teen pregnancy, abuse, and human trafficking. Children with disabilities and the LGBT community face discrimination (Humanium 2013). In rural areas, children with disabilities have no access to education. There are only two schools in Roseau, the capital, that accommodate children with disabilities. In

Table 1 OECS Member States and Their Size

Island(s)	Area
Antigua, Barbuda, and Redonda	170.8 square miles (442.6 sq. km)
Dominica	289.9 square miles (751 sq. km)
Grenada	132.8 square miles (344 sq. km)
Montserrat	39.4 square miles (102 sq. km)
Saint Kitts and Nevis	100.8 square miles (261 sq. km)
Saint Vincent and the Grenadines	150.2 square miles (389 sq. km)
Anguilla	31.1 square miles (91 sq. km)
The BVI	58.3 square miles (151 sq. km)

Dominica, homosexuality is penalized. Penalties for consensual homosexual sexual intercourse are 25 years of imprisonment or commitment to a mental health facility. There are no juvenile courts, so children are, essentially, penalized as adults. For example, a child can be sentenced to life imprisonment, and children are not segregated from adults in jails, which can lead to additional abuses.

Teen pregnancy is a major concern in developing nations, and this issue, along with abuse and human trafficking, touches girls and teens more than any other portion of the population. A report by the International Monetary Fund (IMF) states that 60 percent of adolescents ages 15–19 disclosed having sexual intercourse, but only 25 percent of these participants acknowledged using contraception for every sexual encounter. Low contraception use among Dominican adolescents is surprising given the availability of free contraception at clinics. Among households with teens under the age of 18, 17 percent reported teen pregnancies. Of these households, 80 percent were single-parent homes (IMF 2006, 17).

Child sexual abuse is gaining more governmental and public attention. In April 2016, pastor and assistant chief welfare officer Oliver Wallace held an open meeting in Peebles Park to discuss child abuse in Dominica. Wallace stated that between 2010 and 2015, there were 900 reported cases of child abuse; 80 percent of those cases involved child sexual abuse (Dominica News Online 2016a). Jemma Azille-Lewis, the coordinator of the Child Abuse Prevention Unit, stated that, in 2015, 128 children were sexually abused in Dominica; 73 of those cases involved children 10 years old and younger (Dominica News Online 2016b). Given Dominica's population, this number is high, but the willingness of government officials to publicly address these issues bodes well for a process of resolution.

Human trafficking is on the rise globally; the developed and developing world both profit from this form of abuse. While UN reports suggesting that Dominica and other OECS member states are unwilling to address human trafficking, the opposite seems to be the case regarding Dominican law and its enforcement. There are two Dominican laws that can apply to human trafficking: the Sexual Offenses Act (1998) and the Offenses against the Person Act (2003). These laws are less than 20 years old, implying that the government of Dominica actively addresses sexually based crimes, including sex trafficking. As an example of the Dominican government's commitment, in 2014, Dominica intercepted a human trafficking ring responsible for sending English-speaking workers to neighboring French-speaking Guadeloupe (Kentish 2015).

Grenada

Girls and teens in Grenada face issues such as poverty, HIV/AIDS, teen pregnancy, physical and sexual violence, and underage sex with older men. Humanium reports that while the World Bank classifies Grenada as an upper middle-income nation, 56 percent of the population under the age of 25 lives in poverty, which is significant, as 25 percent of the population is under the age of 14 (Humanium 2013). A large percentage of the nation's young living in poverty leads to an increase in child labor. While it is illegal for children under the age of 14 to work, there is little monitoring to ensure that children are not working or that the children 15 years old and older who are working follow the guidelines.

The greatest health challenge Grenadian girls and teens face is the prevalence of HIV/AIDS and other sexually transmitted infections. Currently, condom use and other forms of birth control are available, but there is a hesitance to utilize them that is possibly related to a lack of sex education in both the schools and homes. Limited sex education and birth control use led to teen pregnancy on the island, and pregnant teens are dismissed from school, which leads to higher rates of poverty among women and their children.

Physical violence in the form of corporal punishment is an issue in Grenada that remains difficult to combat because of a culture that largely permits this form of discipline. In Grenada, "sexual violence is a recurring problem," with around one-third of Grenadian children suffering sexual violence (Humanium 2013). Incest is one cause of sexual violence. It is a widespread issue, and many cases

go unresolved due to stigma, resulting in victims and their families not reporting it.

Humanium (2013) notes that UNICEF is concerned by the rise in "sugar daddies" offering "protection" to young girls in exchange for long-term sexual favors. Legislation exists to protect girls under the age of 16, the age of consent; however, those laws demonstrate a gender bias, as they do not protect boys. In addition, older male perpetrators are rarely subject to legal ramifications when they have long-term sexual relationships with underage girls.

Montserrat

UN Women's "Montserrat: Overview of Country Gender Equality Status" (2015) notes that female unemployment was 4.1 percent in 2011. The same overview, citing the UNESCO Institute for Statistics, found that, in 2007, female net enrollment in secondary school was 96 percent. However, a 2004 UN Women's report on Montserrat found that 33.5 adolescents per 1,000 gave birth (UN Women 2015). The nation has no gender policy or national strategic plan on gender-based violence, but in 2013, no intimate-partner homicides occurred. In addition, Montserrat has neither signed nor ratified the UN Convention on the Rights of the Child (UNCRC).

Despite appearances of being free of violence against women (VAW), in December 2013, an author using the name "An anonymous young lady" submitted a poem titled "The Concealed Secrets of Montserrat" to *Montserrat Reporter Online* listing the many issues faced by girls and teens on the island. The poem mentioned sex trafficking by "big fish," early prostitution initiated by "mothers marketing their daughters," teen pregnancy that is "now more common than colds," pornography, incest, domestic violence, and sexually transmitted infections. No official reports exist to support these claims, which the author states are because "many want to hide the truth of the situation under the carpet" and the "police's excuse is always lack of proof. No evidence." In fact, little to no official valuable information is available on issues involving girls, teens, or women to dispute this writer's contentions. If even a portion of the claims made in this poem can be proven, Montserrat faces the possibility of a lost generation of girls and teens who may very well grow and perpetuate many of these social issues. However, without any statistics to back these claims, any additional information on girls and teens in Montserrat remains unknown.

Saint Lucia

Humanium (2013) identifies seven issues relevant to children in Saint Lucia. Those issues are poverty, corporal punishment, sexual violence, child labor, the right to an education, the right to health care, and alcohol and drug addiction. Poverty in Saint Lucia remains an issue reflected by the fact that 25 percent of the entire population lives in poverty. Poverty affects children in several ways, including access to food on a consistent basis; half of all Saint Lucian children lack access to a secure food source. Poverty also places children in the position of working to help support their families. Saint Lucia is like most countries that rely on agriculture: there are few safety regulations or restrictions. Children in rural areas in Saint Lucia often work with their families to harvest bananas. The children of the working poor can be excluded from obtaining an education. Until the 2006–2007 school year, Saint Lucian children who did not pass the Common Entrance Examination were excluded from attending secondary school (Commonwealth Network 2017c), thus contributing to the continuation of the cycle of poverty.

In addition, there are many children whose parents cannot afford to access health care. Humanium (2013) reports that HIV/AIDS is rising among teenagers, while the number of children born underweight and “teen health issues such as mental, developmental, and reproductive health problems” remain slow to address and resolve. One of the health-related issues that continues to increase is teen alcohol and drug abuse. While many children between the ages of 10 and 19 drink and smoke marijuana, incidents are lower among females than males.

Saint Lucian children also face corporal punishment and sexual violence. In Saint Lucia, children and teens can be subjected to a “reasonable” amount of corporal punishment by their parents, guardians, caregivers, and teachers. The issue is the definition of *reasonable*; the adults responsible for reprimanding children and teens often allow punishment to become abuse. Saint Lucia’s Criminal Code (2005) attempts to deal with sexual offenses while respecting children’s rights. For example, children under the age of 12 cannot be charged with rape (88). The age of consent is 16 years of age (88), and adolescents under the age of 21 cannot be charged with unlawful sexual connection (90). The Criminal Code (91) offers a strict penalty of life imprisonment for sexual contact with a child under the age of 12. The issue with sexual violence in Saint Lucia is that because of the social stigma, familial relationships, or

fear of retribution, many victims do not report offenders, despite the avenues available, making it difficult for police to enforce the Criminal Code.

Saint Kitts and Nevis

Jacqueline Sealy-Burke (2007) produced a report for UNICEF identifying three forms of abuse in Saint Kitts and Nevis that affect girls and teens. They are neglect, physical abuse, and sexual abuse. Of these three, neglect cases comprise the largest number at 84 cases, or 61.7 percent of all reported cases. Physical abuse cases numbered 27, or 19.8 percent, and sexual abuse numbered 11 cases, or 8.08 percent. Of the sexual abuse cases, 18, or 33 percent, were committed against children (4). In addition, the report states that teen pregnancy—particularly among girls and teens under the age of 16—is rising. The chief medical officer noted that pregnancies among girls and teens between the ages of 10 and 14 were increasing, which could reflect an increase in sexual abuse or a lack of sex education as a part of the curriculum or in the home.

Another child-specific issue that children in Saint Kitts and Nevis face is the juvenile justice system. Children can be held criminally responsible beginning at age eight, which means that children can also be imprisoned at this age. Because there are no juvenile facilities, these children are housed in prisons with adults, where they are subjected to additional abuse and isolation. The code of justice also allows for children to be punished by whipping, which is administered by a police officer in the presence of the child’s parents and civil servants (Humanium 2013). The child is subjected to a medical exam before the punishment is administered.

Saint Vincent and the Grenadines

The UN Women’s National Review of the Beijing Platform for Action + 20 (Ellis & Associates 2014) reveals that the major issue for girls and teens in Saint Vincent and the Grenadines (SVG) is pregnancy. A 2013 news report noted that, in 2012, 8 girls, or 17.9 percent, between the ages of 11 and 14 gave birth in SVG (Caribbean360 2013). The 2007–2008 country poverty assessment noted that 49.3 percent of women in SVG “had their first pregnancy between 15 and 19 years of age” (Ellis & Associates 2014, 15). The 60.2 percent of women who had children in their teens live in the poorest 20 percent of the population, which connects teen pregnancy to long-term poverty. In addition, in SVG, teenage girls who become pregnant are

not allowed to continue their education, and underemployed or unemployed single mothers contribute to the cycle of mother-child poverty.

Another element to teen pregnancy in SVG that is troubling is the fact that many of the children's fathers are older men, with multiple sexual partners, in relationships with children and teens. The presence of older men in this cycle, who are not necessarily contributing to the care of their children from these relationships, are the elements of exploitation and abuse. The age of consent in SVG is 16; therefore, these relationships are illegal by nature. Children ages 11–12 may not be aware of sexual intercourse, relationships, or consent. Sexual relationships between girls of this age range and older men may rest solely on the older man sexually abusing children. Teen girls may be sexually exploited by these older men, trading sex for money or material items. These relationships not only produce another generation of children living in poverty, but mothers, who are victims, enter an inescapable cycle.

The SVG Division of Gender Affairs in the Ministry of National Mobilisation instituted some programs to combat the cycle of poverty caused by teen motherhood. A program helps teen mothers return to school to complete their secondary education. Student mothers receive financial assistance for day care, school uniforms, and transportation.

Anguilla

In Anguilla, the girls and teens are impacted by disabilities and teen pregnancy. A Caribbean Development Bank (2009) report notes that the Arijah Children's Foundation is working toward helping children with disabilities, particularly those in preschool, as this population is not receiving the required resources. In addition, Arijah attempts to provide more outreach to the parents of children with disabilities, but it finds this task difficult because many parents refuse to accept that their children have disabilities. As with the rest of the region, Anguilla has problems combating teen pregnancy, which could stem from a variety of sources, including child sexual abuse, incest, or sex trafficking. Yet, there are few figures available.

British Virgin Islands

Teens and girls in the British Virgin Islands (BVI) often participate in at-risk sexual behavior, which can lead to teen pregnancy. Minister of Education and Youth Myron Walwyn stated that teen pregnancy was becoming a major

issue in the country, and the evidence provided was 12 pregnant teens in secondary schools in the 2014–2015 school year alone (BVINews.com 2014). Unprotected sex increases the number of unplanned pregnancies and incidents of sexually transmitted infections. While Walwyn claimed that teen pregnancy is typically a topic that many nationals would rather avoid, it must be addressed, and not necessarily by the government, which is already overtaxed. Walwyn also mentioned that the increase in teen pregnancy may be the result of more focus on young men than on young women, demonstrating a gender bias in how youth issues are addressed. Although there are many civic organizations in the BVI working together and with the government to address youth issues, these organizations are not offering concrete solutions, such as sex education or job preparation; instead, they are focusing on raising self-esteem and changing behavioral attitudes. These programs do not necessarily help prevent at-risk sexual behavior or teen pregnancy.

Conclusion

The OECS are, in addition to developing educational and social service programs directed at girls and teens, also working on implementing national policies that target the sex trafficking industry. However, with economic concerns taking precedence, these policies may trail behind.

In addition to sex trafficking, girls and teens in the OECS sometimes engage in sexual relationships in early adolescence, typically with older men. This often leads to pregnancy and the births of, on average, two children to each woman before she reaches age 20 (Braithwaite 1988, 68). The UNFPA report on adolescent pregnancy states, "Zero tolerance toward child marriage and pregnancy among adolescent-girls is the goal" (Loaiza and Liang 2013, 34). The economic effect of teen pregnancy on the region notwithstanding, there are also many impacts on society and the families resulting from teen pregnancy and motherhood, including an increase in single-parent families, low educational attainment for both mother and children, and a lack of participation by the father in child-rearing.

Early sexual activity without sexual education can also lead to an increase in reported cases of HIV/AIDS in the region. Luckily, Medwiser (2014) reports that, after 2009, the number of new HIV/AIDS cases in the Caribbean decreased. Yet, the same report states that, as of 2009, 240,000 people throughout the Caribbean were living with HIV. As with most reports of its kind, it fails to account

for the number of people who are infected and not seeking treatment or who do not know that they are infected. Therefore, the number may be higher. Medwiser (2014) also claims that women between the ages of 22 and 44 are at the highest risk; however, with the early onset of sexual activity among girls and teens, there is a possibility that the age group is considerably lower.

The prevalence of corporal punishment in the OECS also remains an issue. The practice of publicly beating a child seems not only cruel but outdated. It is also somewhat hypocritical that nations in the Middle East, Asia, and Africa receive international attention for public displays of corporal punishment; yet, nations in the Caribbean are excused.

Overall, girls and teens are in a precarious position because of the issues mentioned. One of the barriers to resolving these issues remains the unwillingness to publicly address them. There is some attempt in each nation to address and resolve these issues, but to varying degrees. While economic concerns make the implementation of many programs problematic, there are still efforts to work toward resolutions.

Education

Educational Opportunities and Availability

Formal, public, and universal education in the Caribbean has a short history of less than 200 years. For the most part, religious schools undertook the responsibility for regional children's basic education. Later, after emancipation in the British colonies, the Negro Education Grant opened more opportunities for newly emancipated Caribbeans, but those opportunities disproportionately favored urban children (Spry Rush 2011, 23). Few slaves received an education, but mixed-race female descendants of slaves and European landowners did. Research by Verene A. Shepherd (1999) reveals that education for free women of color was limited, but they did receive training focused on improving their opportunities in "feminine occupations," such as needlework and embroidery (Shepherd 1999, 74). Free children of color with more affluent fathers were often sent to Europe to complete their educations, which consisted of "genteel" occupations, such as music and dancing (Shepherd 1999, 74). While these girls were prepared for marriage to wealthy, most likely European, men they were unprepared for life in the Caribbean colonies. In the 21st century, educational opportunities for Caribbean girls and women have increased significantly, and throughout the

OECS, girls and women are encouraged to pursue educational opportunities to secure successful careers at home and abroad.

Reports initiated by both UNESCO and the OECS nations indicate that education in the OECS is compulsory in primary school and secondary school (ages 5–16). Education is divided into four levels: preprimary and early childhood education (ECE), primary, secondary, and tertiary. In countries where public education is available, it is also free. While tuition costs are waived, parents are expected to pay fees and purchase books and uniforms; however, assistance is available to parents unable to meet these additional costs.

Antigua and Barbuda

The Antigua and Barbuda Educational Statistical Digest provides information on enrollment trends in the nation (Nicholas and George 2012). Females comprise 80 percent of all teachers, with 16 percent untrained and 28 percent trained (14). Day care/crèche and preschool female enrollment was 65.8 percent between the 2005–2006 and 2010–2011 school years (19). Primary and secondary school female enrollment is considerably lower. All primary, junior secondary, and special education schools had cumulative female enrollments of 48.9 percent and 49.1 percent in 2010–2011 and 2011–2012, respectively (20). This indicates a 16–17 percent decrease in female enrollment after preschool. More specifically, junior secondary enrollment in 2010–2011 was 31.8 percent female (20). This grade-level classification was phased out in 2011, leaving only ninth grade statistics (33). Secondary school enrollment was slightly higher, with 51.8 percent and 50.4 percent females in 2010–2011 and 2011–2012, respectively (34).

The results of the Statistical Digest show "a sharper decline in the enrollment of girls (11.0 percent) in primary schools than there has been boys' enrollment (9.1 percent) over the 7-year period 2005–2006 to 2011–2012" (45). The Digest also shows that although boys' enrollment in secondary school is typically lower than girls', it has been increasing at a rate of 51.2 percent, whereas girls' secondary enrollment increased 20.7 percent between 2005 and 2012 (46). Statistics suggest that males benefit more from Antigua and Barbuda's move toward universal secondary education (USE) than females.

The Digest reports that by July 2010, 5.4 percent of females repeated in grades K–6, and 0.7 percent dropped out. By July 2010, the secondary school female repetition

was 6.8 percent, and the dropout rate was 1.8 percent. Female promotion rates were 93.9 percent and 91.4 percent for primary and secondary schools, respectively (49). Overall, males tended to repeat more than females. However, females were slightly more likely to drop out during secondary school than males. The Digest also mentions that these statistics are incomplete, as not all schools reported.

The government of Antigua and Barbuda's educational programs includes Social Safety Net Programs to help parents and to ensure school attendance and completion. One of these programs is the School Meals Programme. The Digest reports that between September 2010 and June 2011, the Meals Programme served 312,918 meals at a total cost of ECD\$2,038,914.26 (approximately USD\$755,000) (53). Again, these figures do not represent all public schools, as in some areas, students returned home for lunch and did not require the meal vouchers. In addition, there is a Schools' Uniform Programme. Parents may receive two vouchers per school year for each part of the uniform; for example, one voucher for a shirt and another for pants. In the 2011–2012 school year, 36,411 uniform vouchers were issued to a total of 12,137 students from 8,092 parents (53).

There are only two foreign tertiary institutions in Antigua: the University of Health Sciences Antigua and the American University of Antigua. Both are private, for-profit medical schools. There are three other tertiary institutions in Antigua and Barbuda: Antigua State College in Golden Grove, Antigua; the Antigua and Barbuda Hospitality Training Institute in Dutchman's Bay, Antigua; and the Antigua and Barbuda Institute of Information Technology in Saint John's, Antigua.

Dominica

World Data Atlas reports that the Dominican Ministry of Education (MOE) spent 5 percent of its gross domestic product (GDP) on education in 1999, totaling USD\$191.5 million. Primary education received the largest share of public education funding at 51.7 percent. There is a marked gender disparity in staffing; 72 percent of primary teachers and 70 percent of secondary teachers are female, leading to the "feminization" of the school system and male students rarely encountering male teachers. Dominican female teaching staff is 100 percent in preschool, 85 percent in primary, and 58.5 percent in secondary. As of 2005, there were 60.1 percent, 59.9 percent, and 31.3 percent trained teachers in preschool, primary, and secondary schools, respectively.

The UNESCO report suggests that the high percentage of male primary and secondary school student repetition may be the result of fewer male teachers as well as the presence of untrained teachers in the classrooms. As of 1998, 36.8 percent of Dominican teachers were classified as unqualified.

The UNESCO World Data Report (2006) shows that female enrollment in Dominican primary and junior secondary schools averaged 48 percent between 1985–1986 and 1997–1998. As of 2004, secondary school enrollment was 7,477 students, with 50 percent females. The report also states that female students have historically dominated secondary school education enrollment in Dominica.

A report by the UNESCO Institute for Statistics (2007) indicates that as of 2005, female student enrollment was slightly higher than that of male student enrollment. The enrollment for Dominican preschools was 1,500 female students, or 50 percent. Primary school enrollment was 5,000 female students, or 50 percent, and secondary school enrollment was 4,000 female students, or 57 percent. Primary schools have a female student intake of 46.1 percent, a repetition rate of 2.3 percent, and a survival rate to last primary grade of 83 percent. Secondary school intake is 92.1 percent of the female school-age population, and the repetition rate is 7.7 percent, which is lower than the male repetition rate of 10.6 percent. Female students, while slightly less likely to complete primary school than their male counterparts, are more likely to complete their secondary educations.

There are six tertiary institutions available after secondary school completion. Clifton Dupigny Community College, formerly Dominica State College, is the main center of higher education in Dominica, offering academic and vocational and technical courses. In 1997–1998, 199 students were enrolled in the academic programs, and 70 percent were female; female enrollment in the vocational and technical division was 20 percent.

The Teacher's Training College is available to students interested in teaching and is operated by the MOE. The Princess Margaret Hospital School of Nursing is attached to the main hospital and serves Dominicans and other nationalities. Ross University School of Medicine offers medical degrees, but predominantly to American citizens. There are some bachelor's and master's degrees available at University of the West Indies through its School of Continuing Studies and Distance Education Center. The Institute for Tropical Marine Ecology (ITME) is a newly established institution in Dominica that is part of a 13-nation

educational partnership. While ITME does not offer degrees, it does offer high school graduates and university students specialized courses in marine ecology, research, and conservation.

There are also several open or distance education programs available to Dominicans. They are offered through the following universities: the University of London, Leicester University, the Commonwealth of Learning, the University of Cambridge, the Association of Chartered Accountants, and the Institute of Canadian Bankers.

Grenada

The national education system in Grenada falls under the Ministry of Education, Human Resource Development, and the Environment. In addition to basic primary and secondary education, the MOE oversees additional services, such as adult education and literacy, drug control, early childhood education, a school food program for primary and secondary schools, student support services, and a special education program that covers the following categories: autism, blindness, deafness and hearing impairments, emotional disturbance, mental retardation, multiple disabilities, orthopedic impairment, speech or language impairment, traumatic brain injury, and visual impairment (MOE 2014).

Statistics compiled by the Commonwealth of Nations show that, as of 2008, Grenada had 98.5 percent elementary and 85.4 percent secondary enrollment. The gross enrollment as of 2009 was 91.8 percent, with a primary female-to-male ratio of 0.94:1 and a secondary female-to-male ratio of 1.01:1 (Commonwealth Network 2017b). Like many nations in the OECS, Grenadian primary and secondary schools boast a low student-to-teacher ratio. The MOE reports that, in 2009, the ratios were 17:1 and 18:1 in primary and secondary, respectively. These low numbers in the classroom mean more individualized attention for the students and, possibly, a higher successful completion rate.

In Grenada, there are three tertiary institutions: TA Marryshow Community College, Saint George University, and the UWI DEC. Marryshow offers associate degree programs, first-year university courses, and GCE A-level courses. Saint George's primary bachelor's degree program is medicine, but the university also offers programs in veterinary medicine, arts, and sciences. Students may also participate in the UWI's programs through its DEC. UWI also offers a teacher training certificate that is obtainable in two years and an ECE diploma in three years.

Montserrat

The education system in Montserrat is maintained by the Ministry of Education, Health, Community Services, Sports, and Youth. The MOE oversees different aspects of youth services on the island largely because of the island's small population. Because of the MOE's large scope, education in Montserrat is the specific responsibility of the Permanent Secretary of Education.

Before the eruption of the Soufriere Hills volcano in 1998, Montserrat allocated approximately 20 percent of its annual budget to education (StateUniversity.com 2017). Immediately after the eruption, which led to a drastic decrease in the local population, only 8 percent was spent on education (StateUniversity.com 2017).

Education on Montserrat is compulsory from ages 4–14 and free to age 17, which covers ECE, primary, and secondary education to Caribbean Secondary Education Certificate (CSEC) examinations. Reports by UN Women indicate that, in 2014, 49 percent of female students, or 215, were enrolled in primary school in Montserrat (UN Women 2015). The same report states that 48.4 percent of female students, or 166, were enrolled in secondary school in Montserrat (UN Women 2015). These figures indicate that fewer female students are taking advantage of compulsory education on the island. Females under the age of 15 are only 49.5 percent of the island's population, according the island's statistics department, which means that fewer female students will enroll than male (Statistics Department, Montserrat 2011).

Tertiary education on Montserrat is limited, reflecting the island's financial predicament and low population. With fewer Montserratians to serve, these institutions' services are no longer as needed. Between 1972 and 1997, Montserrat Technical College provided tertiary education on the island. In addition, the UWI school of Continuing Studies offered some postsecondary educational opportunities. In 2004, Montserrat Community College was established to provide additional postsecondary education to Montserratians (Montserrat Community College 2016). To date, little information is available on the institution.

The UNESCO Institute for Statistics, as reported by UN Women, notes that, by 2010, an estimated 1,212 Montserratians were enrolled in tertiary institutions (UN Women 2015). The breakdown of student enrollment per institution is not available.

Because the island continues to recover from the eruption of the Soufriere Hills volcano, information on the

availability of education in Montserrat remains limited. Statistics on the island regarding enrollment, number of teachers, or even the number and locations of schools is also lacking.

Saint Lucia

Education in Saint Lucia has trailed behind other nations in the OECS with universal education. The 1997 Saint Lucia Education Act mandated compulsory education to age 16; however, universal secondary education was not introduced in Saint Lucia until the 2006–2007 school year (Commonwealth Network 2017c). The education system in Saint Lucia is maintained by the Ministry of Education, Innovation, Gender Relations, and Sustainable Development. The education portion of the ministry is under the direction of the chief education officer who oversees the school system. Currently, the ministry is contemplating the development of a technical and vocational education section to reach interested students.

UN Women, citing the UNESCO Institute for Statistics, noted a 91.5 percent female net enrollment of 8,592 students and an 81.1 percent net enrollment of 7,021 students in primary and secondary, respectively, in 2013 (UN Women 2015). The female primary net enrollment percentage was slightly lower than male enrollment, which was 94.5 percent. This deviation could be explained by the population of children ages 14 and under, which was 49.5 percent female and 50.5 percent male (Statistics Department, Montserrat 2011).

Saint Lucia is host to 10 tertiary institutions, 5 of which specialize in the health sciences or medicine. Several are in collaboration with American universities and offer Saint Lucian students a variety of higher education options. While the ministry regulates and monitors primary, secondary, and some tertiary educational institutions, offshore medical schools are neither licensed nor regulated by any government entity, thus making the island more appealing to less-reputable institutions. Despite this issue, Saint Lucia's only community college, named in honor of Sir Arthur Lewis, the late Nobel laureate in economics, maintains a high standard of education, enabling its students to complete their bachelor's degrees at any number of colleges and universities in the region and abroad. In addition, the college's Division of Teacher Education and Educational Administration offers a variety of programs that instruct teachers and administrative staff.

Saint Kitts and Nevis

The Ministry of Education in Saint Kitts and Nevis is responsible for overseeing the education system on both islands. A chief education officer in Saint Kitts and the principal education officer in Nevis uphold ministry policies on each island. In addition, the ministry maintains a special education unit on each island to meet this population.

In 2013, in a report by the UNESCO Institute for Statistics cited by UN Women, 80.7 percent of females were enrolled in primary school, and 87.9 percent were enrolled in secondary school. UNESCO reports a total of 5,366 girls and adolescents in primary and secondary schools in 2013 (UN Women 2015).

There are six tertiary institutions on Saint Kitts and Nevis: Clarence Fitzroy Bryant College (CFBC), the International University of the Health Sciences, the Medical University of the Americas, Saint Teresa's Medical University, the Ross University School of Veterinary Medicine, and a branch of UWI. The Commonwealth Network reports that the student populations at the offshore universities are almost entirely North American, meaning that these institutions are not serving local populations. Of the institutions, CFBC is the only locally based tertiary institution. CFBC offers programs in teacher education, technical and vocational education, management studies, and nursing and health sciences. As of 2008, female-to-male gross enrollment at the tertiary institutions was 2.1:1 (Commonwealth Network 2017d).

Saint Vincent and the Grenadines

The Ministry of Education in Saint Vincent and the Grenadines is divided into 10 departments overseeing the educational system. The MOE is headed by a minister of education and a permanent secretary. UN Women reports that the primary enrollment rate for females was 90 percent in 2013; male enrollment was 93.1 percent (UN Women 2015). Female net enrollment in secondary school surpassed male enrollment by 2.6 percent, for 86.5 percent. UNESCO (2016b) reports that, in 2010, there were 213 out-of-school adolescent females, and in 2014, there were 578 out-of-school primary school girls, which dropped significantly to 78 in 2015. However, the school-age population in primary was 12,784 and 9,664 in secondary in 2014 (UNESCO 2016b). While 578 female students out of school is significant based on the educational level and the ages this statistic encompasses, the number of girls enrolled in school is still an accomplishment given the country's financial needs.

Saint Vincent and the Grenadines have three tertiary institutions: Saint Vincent Technical Community College, the Trinity School of Medicine, and the Teachers Training College (UWI). The community college (CC) and Teachers Training College serve local populations. Students from the CC are prepared to pursue educational opportunities regionally and abroad. Trinity, however, does not serve local populations. The International Medicine Studies recognized that a physician shortage was imminent and that U.S. medical schools were unable to produce enough graduates to fill first-year residency slots. A group of educational and business leaders joined together to provide greater opportunity for aspiring physicians (IMS-Medstudy 2016).

Trinity currently has an enrollment of 407 students, with 11 percent from the Caribbean (45 students), and is 55 percent female. Unlike many offshore medical schools, Trinity accepts regional students, but there is no information available on whether this population includes Vincentians.

Anguilla

The education system in Anguilla is monitored by the Education Department under the direction of the chief education officer. In addition, five other officers oversee specific areas of education. Information on enrollment in Anguilla is limited and, in some areas, unavailable.

The UNESCO Institute for Statistics has collected some information on education in Anguilla that indicates relatively low student enrollment. In 2011, there were 766 and 335 female students enrolled in primary and secondary school, respectively (UNESCO 2016a). Secondary school enrollment is around half of the primary school enrollment, suggesting that adolescent females in Anguilla are not getting access to education, which limits future financial independence.

There are two tertiary educational institutions in Anguilla. The UWI maintains an open campus in The Valley, the capital city, and Anguilla Community College also offers some programs. However, with limited employment available postgraduation, these tertiary educational opportunities may reflect the immediate needs of Anguillians.

British Virgin Islands

Education in the BVI is monitored by the Ministry of Education and Culture, under the direction of the minister, the permanent secretary, and the deputy secretary. The ministry has a wide variety of responsibilities, such

as censorship, cinemas, colleges and universities, culture, ecclesiastical affairs, education, festival and fairs, historical sites and monuments, museums, prisons, public libraries, scholarships, sports and recreation, and youth affairs (Ministry of Education and Culture 2017).

The UNESCO Institute for Statistics reports that primary school enrollment for female students was 1,552 in 2014. This number is quite high given the overall population of the islands. Secondary school enrollment for females was considerably lower at 678. The low number of students in secondary school may not reflect the reality of enrollment, as the report covers only the first three years of secondary school.

The BVI has one tertiary institution. H. L. Stouff Community College opened in 1991 and continues to serve British Virgin Islanders. However, no four-year or upper division institution exists in the BVI, limiting tertiary educational opportunities for residents.

Conclusion

Overall, while primary and secondary education are mandatory and state-sponsored in the OECS, enrollment numbers indicate that, in some nations, female students continue to trail behind their male counterparts when enrollment is examined in relation to the overall population. This situation could reflect economic issues, both regional and global, that continue to affect women and children more than men. In some households, female children may be expected to stay at home and care for younger siblings or older adults. While school is mandatory and offered to the public, parents may struggle to provide other school necessities, such as uniforms, textbooks, supplies, and transportation. For single-parent households, a lack of additional financial support from the absent parent and limited community support could result in low female primary and secondary school enrollment due to the costs.

Tertiary institutions are plentiful and available in some nations, but fledgling in others. However, the extent to which those institutions support local students remains to be seen. For example, many offshore medical schools continue to present a problem to regional education. These schools are not situated in the region to encourage enrollment among local students, but to offer places to affluent North American students. Although female students outnumber male students in tertiary education, in the OECS, this is not necessarily the case. One of the issues is access to a tertiary institution. Another factor impacting female

enrollment is low enrollment in secondary school. Without a secondary education, students in the OECS cannot enroll in a regional college or university. No opportunities exist in the region to obtain a general education diploma. Therefore, students in the OECS who are academically capable but unable to obtain a traditional high school education remain at a disadvantage, limiting employment opportunities in fields requiring higher education.

Health

Access to Health Care

On October 13, 2016, OECS health ministers met for the second time that year to discuss a plan to institute national health care for citizens of member states (GIS 2016). Typically, OECS citizens travel to the United States for medical treatment that is not available locally. With no health insurance to cover medical treatment outside of the region, simple procedures can become financially draining. OECS nationals who do not have the financial resources to travel for treatment are at a disadvantage. To resolve these issues, Dr. Stanley Lalta, the head of the UWI Health Economic Unit, suggested a regional medical cooperative that is both convenient and cost-effective (GIS 2016).

OECS health ministers are also addressing the issue of health care coverage for single mothers. To begin the process of resolving this issue, the government of Dominica allocated funds as a part of the 2016-2017 national budget to provide health insurance to single mothers so that health and physical well-being will not prohibit this group, which is considered “vulnerable,” from continuing to care for their children (GIS 2016a). This plan targets single mothers who are either unemployed or underemployed in the island’s tourism industry and will be under the auspices of a new department in the Social Security Ministry (GIS 2016).

Conclusion

One of the goals of OECS member states is to facilitate access to health care for nationals. The implementation of national health care plans is a major improvement, given the economic status of many of these nations. Efforts to target underserved groups with health care plans demonstrate their willingness to place the well-being of their nationals above other concerns. In addition, Dominica’s commitment to single mothers as a part of its health care plan is a sign that the nation is placing the health of underserved women and children first.

Employment

The employment sector in the OECS, while not completely stagnant, is neither growing at a rate to sustain the entire population nor recovering from the recent global financial crisis. Research by Kim Clarke and David Popo (2014) refers to OECS member states as “small open economies” that are “vulnerable to external shocks while being plagued with internal issues.” Internal issues include changes to labor force trends, poverty level increases, and fluctuating adjustments to trade agreements. An inert economy impacts the labor force by decreasing the number of available jobs, causing unemployment and, by extension, higher poverty (Clarke and Popo 2014).

Antigua and Barbuda

Employment in Antigua and Barbuda is dominated by the islands’ tourism sector. In 2011, tourism and travel comprised 69.8 percent of the islands’ total employment, offering 19,500 jobs in this service industry (Commonwealth Network 2017a).

Dominica

Dominica’s economy was, until recently, dominated by agriculture—primarily with bananas (CIA 2016). However, in recent years, the economy has shifted from a focus on agriculture to the service sector, driven by tourism. Because of this shift, Dominica’s service industry comprises 68 percent of the economy, with agriculture and industry at 16.5 percent and 15.5 percent, respectively (CIA 2016).

Grenada

Grenada’s economy is heavily dependent on tourism. However, construction and manufacturing are gaining ground. Currently, jobs in the service industry top the employment sector at 76.7 percent, while industry and agriculture offer less employment at 13.9 percent and 9.4 percent, respectively (CIA 2016).

Montserrat

Montserrat’s economy continues to struggle after the volcanic eruption in 1995. In addition, the country’s volcanic activities play a large role in recovery, as half of the island remains uninhabitable (CIA 2016). While public-sector construction is a possibility for boosting the economy, the current economic structure relies on service positions,

which comprise 76.7 percent of the nation's jobs (CIA 2016). The nation's physical size, small population, and limited opportunities contribute to economic stagnation. Industry offers 21.7 percent of the country's jobs, and agriculture now provides only 1.6 percent (CIA 2016).

Saint Lucia

Saint Lucia is attractive to foreign investors because of its offshore banking industry, but tourism provides many service jobs on the island at 83.3 percent (CIA 2016). Agriculture was Saint Lucia's primary economic sector, and bananas were the staple crop. However, competition created the need for Saint Lucian to export crops. Because of the decrease in exporting crops, agricultural jobs are down to 2.9 percent of all positions, but industrial jobs have increased to 13.8 percent (CIA 2016).

Saint Kitts and Nevis

Since the 1970s, the economy in Saint Kitts and Nevis has relied on tourism, which replaced sugar as the nation's main source of revenue. The government officially ended sugar production for export after decades of losses and is turning the country's attention to other income sources, such as offshore banking and manufacturing for export. However, these gains are slow, and the nation continues to rely on tourism. Today, the service industry comprises 72.1 percent of the nation's jobs. Industry gained ground at 26.5 percent, but agriculture is losing its position, falling to 1.4 percent of all jobs (CIA 2016).

Saint Vincent and the Grenadines

The economy of Saint Vincent and the Grenadines is dependent on agriculture, tourism, and construction, but these employment sectors are mercurial—fluctuating because of natural disasters such as tropical storms. Because the nation faces high unemployment, many Vincentians are immigrating to more sustainable economies. As of 2015, 75 percent of the positions were in the service industry, with 7.9 percent in agriculture and 17.2 percent in industry (CIA 2016).

Anguilla

The largest areas of employment in Anguilla are services, such as tourism, boat building, and offshore financial services. The service industry comprised 76.5 percent of all

employment on the island in 2015. The next largest form of employment is 21.1 percent in industries, and agriculture trails at 2.3 percent (CIA 2016).

British Virgin Islands

The economy of the BVI is considered one of the most stable in the Caribbean. While this economy relies heavily on tourism, it is growing because the government is offering foreign entities offshore registration. This island chain also has a strong livestock-raising agricultural industry; however, crops are not suitable to the islands because of the chain's poor soil quality. Employment in the BVI is distributed into services at 59.4 percent, industry at 40 percent, and agriculture at 0.6 percent (CIA 2016).

Conclusion

Throughout the OECS, the service industry, which consists of positions in a variety of fields, accounts for an average of 74.26 percent of employment. Tourism and offshore banking provide many of these service-oriented positions. The reliance on external sources for such a large portion of a nation's income places women and children at risk. The UN's Women Watch (2010) notes that while women number 1 billion people worldwide, many live in poverty, which means that their children also "live in unacceptable conditions of poverty." Tourism in the Caribbean is a mercurial business, as it is based on factors such as affordability and weather; therefore, jobs in this industry remain in a precarious position. As many service industries are staffed by women, despite the increase in employment opportunities, women, and by extension their children, remain at economic risk.

Family Life

Women's roles in Caribbean families are traditionally as caregivers and nurturers. However, this pattern is more prevalent in two-parent families. While the overwhelming number of Caribbean children live in two-parent homes, a large percentage of them live in single-parent homes headed by mothers or grandmothers. In single-parent families, the roles of caregiver and nurturer may be difficult for women to perform because of work obligations and time spent away from home. In these situations, children are usually left in the care of "other" mothers, who are women either biologically related to the children or who are unrelated but take on the roles of caregivers and nurturers, allowing mothers to work knowing that their children are cared for.

The issue of single-parent or mother-headed families seems to be more common among Afro-Caribbeans than any other racial or ethnic group in the Caribbean, and Afro-Caribbeans make up the largest portion of the population in the OECS. Single-parent households in the region tend to be more economically disadvantaged than other groups, and there may be many people relying on a sole income. The correlation between poverty and low educational attainment suggests that children in single-parent households are more at risk than children from two-parent households.

Politics

Caribbean history is one of political activism. Local leaders such as Dr. Eric Williams (1911–1981) and Norman Manley (1893–1969) are just two examples of regional leaders at the forefront of the independence movement. While many examples of Caribbean female political activists exist, their stories are not as well recorded as those of their male counterparts. Shepherd's *Women in Caribbean History* (1999) provides some background on the roles Caribbean women played in emancipation, independence, labor parties, and government leadership. Dominica elected Dame Eugenia Charles (1919–2005) its first female prime minister in 1980 (Shepherd 1999, 177), and she is only one example of Caribbean women who are active in politics.

Despite this rich history of political activism, in a 2013 interview, René Baptiste, the OECS Speaker of the House for the General Assembly, noted that Caribbean women have still not been fully integrated into the decision-making processes of their countries. Baptiste believes that regional women are deterred by the “rough and tumble” of politics—that they fear the unpleasantness of the political process (Simon 2013). Politics can be a very disagreeable business, but when women hesitate to become actively involved in the political process, they are further marginalized. Female participation in Caribbean politics is as critical now as in the past, and if women are to prevent gender-based issues from being sidelined, they must actively participate in regional politics.

Caribbean women, particularly in the OECS, where women's employment and means of financial independence are reliant on external sources, must advocate more for themselves. While organizations such as UN Women continue to provide support, these organizations are external in origin and struggle to understand the local issues that women face. For example, the United Nations and other

nonregional organizations continue to group Latin America and the Caribbean together as though they are a monolithic region rather than two distinct regions that happen to be close geographically but with different histories and currently pressing issues. In addition, external organizations often have agendas that either deviate from the needs of local stakeholders or are simply not productive.

For example, the European Union disbursed a USD\$55.2 million aid package to Montserrat in January 2013 to boost the nation's economy “with a specific focus on public finance management, public sector reform, and prudent economic management” (CIA 2016). To a nation as devastated as Montserrat, management and reform are long-term goals; more immediate solutions are needed to pull the country out of a two-decade financial slump. In addition, no mention is made of schools, hospitals, or housing as provisions of this aid package, which are immediate needs to Montserratians.

Situations such as this one prove that the increased involvement of Caribbean women in politics as advocates for regional causes may help to address some of these issues that are most pressing to women and their children.

Religious and Cultural Roles

The Caribbean is home to indigenous and multiple settler populations, impacting regional culture. There are many languages spoken and religions practiced in the region. Overall, throughout the Caribbean, women take a participatory role in religious practice—particularly in Afro-Christian religions. Research by Dianne M. Stewart (2006) indicates that although women actively participate in many ministries in Caribbean Christian churches, they remain marginalized. Women are not encouraged to “pursue formal theological studies and academic credentials for teaching” (122). This means that women function in churches as the laborers, but they are not encouraged to be leaders or educators. Therefore, they have fewer opportunities to advocate for themselves or other women in the churches. In comparison to Christian churches, African Caribbean religions have high numbers of female participants in leadership positions and as teachers (122). Stewart notes that the power of female leaders in African Caribbean religions is uncontested and that they are well represented in the priesthood (122). Rastafari, despite its message of liberation, was and remains a male-centered religion. The basic tenets of Rastafari subordinate women to men. However, Stewart (123) suggests that, since the

1970s, female Rastafarians have become more vocal—advocating for reform that is more inclusive and less oppressive of women.

Issues

Research indicates that there are four major issues affecting women in the OECS countries. One issue is the number of female-headed households, which represent many households. The second issue is the large number of families living below the poverty level, which is a different measurement than in the United States or Canada, for example. Another issue is the high incidence of teen pregnancies in these countries, which, in turn, could lead to more families living below the poverty level. Perhaps the most critical issue is female employment, particularly the number of women who are underemployed or unemployed (Alonso 2003, 253–254). Currently in OECS nations, incidents of violence against women and girls are becoming a major concern (Olibert 2014). Halima-Sa'adia Kassim notes, "Violence against women or VAW ... remains a pervasive problem and barrier to gender equality and women's empowerment" (Kassim 2014, 1). While the outcomes associated with VAW seem immediate, they have a long-term impact on the immediate family and the public regarding the effect on the public budget (cost to taxpayers) (Kassim 2014). In 2012, the Organization of American States issued a report addressing the issue of domestic violence perpetrated against girls and women, noting that although these incidents are on the rise, both the government and private sector are working to raise awareness and provide help to the victims by providing shelters and educational programs and by focusing on involving those most likely to perpetrate violence against women. For example, a 2014 conference sought to involve men more in finding solutions to domestic violence (Olibert 2014).

Many of the social issues facing women could be alleviated with greater focus on education. The CARICOM Plan of Action states that education opens more avenues of opportunity to become financially independent, which is critical for girls and women in the OECS (Andaiye 2005).

P

Panama

Overview of Country

Panama, officially the Republic of Panama, is located in Central America and is bordered by Costa Rica to the west, Colombia to the southeast, the Caribbean islands to the northeast, and the Pacific Ocean to its south. Spanning 29,119.825 square miles (75,420 sq. km), it is the smallest Spanish-speaking Latin American country. The capital and largest city is Panama City and it is home to nearly half of the country's 3.6 million people (CIA 2016).

Prior to the Spanish arrival in the 16th century, more than 60 distinct indigenous groups with an estimated population ranging from 200,000–2 million lived in Panama. After Europeans colonized the region, indigenous peoples fled into the forests and onto islands to avoid enslavement, torture, and death, but the spread of infectious disease caused a large decline among the indigenous (World Bank 2014). Panama is a constitutional democracy and adopted its constitution in 1904. In 1968, the National Guard staged a coup, which brought indirect military control over the government until 1990. During this time, the National Guard handpicked presidential and legislative candidates and then ensured their victory via subversive means (Hassig and Quek 2007).

As of 2013, more than 24 percent of Panama's population lived in poverty and, according to the World Bank,

3 percent in extreme poverty. Indigenous peoples make up a growing percentage of those in poverty (World Bank 2014; CIA 2016). According to the May 2010 census, the population is 70 percent mestizo (mixed Amerindian and white), 14 percent Amerindian and West Indian mixed, 10 percent white, and 13 percent Amerindian (International Work Group for Indigenous Affairs 2014). More than half of the population lives in the Panama City–Colón metropolitan area, with an urban population of 70 percent spanning several cities, making Panama the most urbanized country in Latin America (CIA 2016). Due to the country's historical reliance on commerce, there is great ethnic diversity, particularly those of Afro-Antillean and Chinese descent, whose ancestors were brought to Panama in the 19th century to help build the Panama railroad. Afro-Panamanians are also significantly represented in the population. Most Panamanians of West Indian descent came to help build the Panama Canal in the 18th and 19th centuries.

Panamanian subcultures have merged to the point where it is difficult to distinguish individual ethnic groups. More so than ethnic distinctions, Panamanians classify themselves along religious lines: the Spanish-speaking Roman Catholic mestizo, the English-speaking Protestant Afro-Caribbeans, and indigenous Indians. The mestizos and Afro-Caribbeans reside throughout most of the country, whereas the majority of indigenous Indians live in the more remote regions. Caucasians primarily reside in larger cities.

Indigenous Peoples of Panama

Today, Kunas (or Guna) constitute 30 percent of the indigenous population of Panama. More than any other group, they have retained much of their cultural heritage (Hassig and Quek 2007). Kunas live mainly on the San Blas Islands or in the Darien region.

The Kuna family is considered the most important unit, with labor traditionally divided along gender lines. Men hunt and gather for food, and women perform household duties and sew. Families in Kuna culture are typically large. Women inherit land from fathers, so parents often hope for female children. When an infant girl is one month old, her nose is pierced; eventually, a ring is inserted through the hole, and larger rings are added as the child grows.

Kuna women have a traditional dress that consists of a blue wrap dress, gold rings in the nose and ears, strings of yellow and red beads around the arms and legs, a black line painted on the nose, and a blouse with mola panels. Mola panels are beautiful and intricate appliqué panels, and the production of these has become a major source of income for the group. Mola makers believe all things have a spirit, so each mola has its own spirit to be revered. Women are expected to be good mola makers, and they begin training at a young age to do so. Molas are typically 16–24 inches and take several months to make.

Emberas reside in the Darien Gap, the largest region in Panama with the fewest inhabitants. The area includes 12 million acres of rain forests and swamps (Hassig and Quek 2007). The Emberas live much like their ancestors, focusing on hunting, gathering, and using forest plants for medicine. Emberas worship their own gods and heal themselves using medicinal plants or *jabainas* (medicine men) when the plants are not sufficient (Hassig and Quek 2007). The Emberas still practice customs such as body painting with plant dyes, and they use traditional hunting methods, using poisoned blowgun darts. More so than any other indigenous group, Emberas elevate women to a more equal status in society, although it is still a patriarchal society. Emberas are skilled artisans who specialize in baskets, carvings, and necklaces, often preferring to exchange items rather than sell them. However, widespread deforestation and aggressive farming are threatening their way of life.

Ngobe-Bugles are related to the Mayas of Mexico and live along the Costa Rican border. The Ngobe-Bugles account for 60 percent of Panamanian indigenous peoples (Hassig and Quek 2007). They rely on the land for their livelihood. Ngobe-Bugles live in hamlets, with family members and relatives residing within the same settlement. There are clearly defined roles for men and women. They also permit polygamy. Ngobe-Bugle Indians sell exquisite jewelry, with their specialty being *chaquira*, a multicolored beaded necklace. They have their own religious beliefs, with music and celebration central to their rituals, as Ngobe-Bugles often make their own instruments out of animal products and wood.

—Jennifer deCoste

Today, six indigenous groups remain, including the Kuna, Embera, Ngobe-Bugle, Wounaan, Naso, and Bribri, with the first three being the most populous. Indigenous groups have traditional gender roles for men and women and their own dialects and languages. Constitutional protections require the government to provide bilingual education in indigenous communities. In addition, indigenous groups have contributed enormously to Panama's visual arts culture, including sculpture, wood carvings, weavings, ceramics, and masks.

Indigenous peoples typically practice faiths specific to their own group. Eighty-four percent of Panamanians are Roman Catholics, 15 percent are Protestant, and the

remaining 1 percent consists primarily of Jews, Muslims, Baha'is, and Hindus (Pew Research Center 2014).

Overview of Women's Lives

In 2014, the UN Development Programme ranked Panama 92nd out of 187 nations based on the Gender Inequality Index (GII, 0.506), placing it in the high human development category (UNDP 2015). The Panamanian Constitution stipulates that all citizens have access to education. Recent legislation and activity has also protected and enhanced women's right to an education, and statistics show that girls are increasing in number in the educational system.

Despite these advances, women still struggle to increase their social and economic statuses and literacy rates, especially among indigenous populations (CEDAW 2010).

The National Directorate of Women, the Ministry of Women, Youth, Family, and Childhood promotes equality of women in the workplace and equal pay for equal work, attempts to reduce sexual harassment, and advocates for legal reforms. A number of private women's rights groups, including the New Men and Women of Panama, APLFAFA (a Planned Parenthood affiliate in Panama), the Center for the Development of the Woman, and the Foundation for the Promotion of Women, concentrate on disseminating information about women's rights, countering domestic abuse, enhancing employment and other skills, and pressing for legal reforms (U.S. Department of State 2007a).

There has been substantial discrimination against persons with disabilities in employment, education, access to health care, and in the provision of other state services; the administration has taken steps to decrease discrimination. Job discrimination based on race, birth, disability, social class, sex, religion, or political ideals is illegal (CEDAW 2010). The law mandates access to new or remodeled public buildings for persons with disabilities; however, the government generally fails to enforce these provisions in practice (U.S. Department of State 2007a).

Latin American women earn, on average, 30 percent less than men with similar skills. In the public sector, a highly significant gap (greater than one-third) exists in wage gaps in Panama between men and women (Ruiz and Rivera 2004). Unequal opportunities affect women's access to paid work and hinder their chances of achieving financial independence. The most visible aspect of women's lack of economic autonomy is poverty, which is accompanied by the lack of freedom and time to travel and exclusion from the social protection that autonomy confers. Many married women, living in either poor or wealthy households, are in a dependent position in relation to the head of the household due to their domestic activities (De Leon n.d.).

Although the government generally respects the rights of citizens, there continue to be problems related to harsh prison conditions, discrimination, violence against women and ethnic minorities, human trafficking, and child labor (U.S. Department of State 2007a).

Girls and Teens

The Panamanian Constitution stipulates that all citizens have access to education, and statistics show that girls are

increasing in number in the educational system (CEDAW 2010). Recent legislation and activity has also protected or enhanced women's right to an education. Subsequently, most girls and teens are in school during the week. Dress is typically casual (jeans and T-shirts). Panama is seeing a growing teen pregnancy rate, and currently 20 percent of all children born in Panama are born to women aged 15–19. Sex education in schools is not prevalent, and abortion is not legal (Sheppard 1992).

Recreation

The heat and humidity is quite intense in Panama, making water and indoor sports quite popular, with martial arts, ballet, swim teams, and canoeing popular choices for children. Wealthier teens also have the option to play sports through members-only clubs, while middle-class and lower-income students play in the health and recreation centers typically located around cities. Although schools offer sports, these are not central to most students' lives (Tompkins and Sternberg 2004). Males tend to be more involved in sports, particularly soccer, while girls typically participate in music, also a central element to youth culture. For urban youth from poorer communities, *padillas*, or gangs, can be an issue. Most youth view the streets as their playground; however, girls are more closely supervised than boys. For a girl's 15th birthday, a quinceañera is celebrated by wealthier families, which includes a reception and dance.

In rural areas, festivals and agricultural fairs are common. In fairs, a queen is crowned, animals are judged for prizes, and carnival rides are available for children. Other traditional forms of entertainment are falling aside for more contemporary forms: nightclubs, movies, and television. Daily recreational activities for rural youth often center on family chores, such as farming, gardening, and caring for animals. Outdoor activities such as swimming, mountain climbing, and hiking are also popular (Tompkins and Sternberg 2004).

Education

Free basic education is offered to the entire school-aged population up to and including the ninth grade. Statistics show that girls are increasing in number in the educational system. In secondary education, girls slightly outnumber boys, although that reverses rather sharply in higher education (CEDAW 2010). The female literacy rate in Panama

is 92 percent, only 1 percent behind males (Knomea 2016). In 2004, 98 percent of girls were enrolled in primary education (Index Mundi 2007). Panama has the second-highest Central American literacy rate, right behind Costa Rica, as directed by the Mesoamerica Project (PM). The PM was developed to remedy the lack of investment and stimulate trade in Central America by building or improving large infrastructure projects, including human development (Pickard 2004). In addition, Panamanian women typically receive more education and stay longer in the system than men (Republic of Panama 2004). Not surprisingly, urban residents have more access to education than rural and indigenous populations. In 2005, 99 percent of boys and girls attended primary school, although only 67 percent of teenage girls continued on to high school (Raad 2007).

In recent years, Panama has made significant strides in eliminating gender inequalities in the area of education, and it is anticipated that, by 2015, the governmental goal of universal primary education will be achieved. Government-sponsored activities to work toward educational gender balance include the institutionalization of gender-based educational policies, intersectional coordination of organizations that work to promote gender balance, nationwide training on gender, and publishing materials that focus on gender inequities (Republic of Panama 2004).

Recent legislation and activity has also protected or enhanced women's right to an education. In 2001, the government passed Executive Decree No. 443, which guaranteed pregnant minors the opportunity to continue and to complete their education. The Ministry of Education has sponsored training regarding laws aimed at stopping gender discrimination and violence. It is illegal to provide differing conditions for career guidance, stereotyped concepts of careers, differing access to career programming, limited access to sports, and limited access to health information based on gender. Despite these advances, women still struggle to increase their social and economic statuses as well as literacy rates, especially among indigenous populations (CEDAW 2010).

Health

Access to Health Care

Public health care at clinics and hospitals is free, and 90 percent of the population has access to health services. The other 10 percent are primarily rural and indigenous peoples who face both economic and geographic access challenges. In addition, limited intercultural contact; limited

health infrastructure, including health care workers; lack of access to medicine; and lack of technology present barriers to access (WHO 2014). The World Health Organization's (WHO) 2014 strategic priority in universal health coverage specifically requested the government of Panama address these challenges for rural and indigenous peoples. Public hospitals often lack enough doctors and beds to treat patients, who often must line up early and wait hours to be seen (World Bank 2014).

Maternal Health

The Panama Declaration, signed by 26 governments in 2013, worked to address inequalities in maternal and child health in Latin America and the Caribbean. Panama's greatest challenge to meeting the declaration's goals is reaching those in remote areas. Maternal mortality rates in these regions range from 10 to 44 times higher than areas with better access to services (Valdivieso 2013).

To a certain extent, the Panamanian government is meeting the goals of the declaration; in 1998, 72 percent of pregnant women received prenatal care, and by 2009, that had jumped to 96 percent (Index Mundi 2016). Women typically give birth in hospitals. Women in labor tend to do so in the same room with limited to no access to pain medication. Women do not receive confidential care and are often not informed of consent processes or of their right to refuse aspects of care (Birth Institute 2016).

Panama practices the tradition of *cuarentena* (quarantine), which lasts up to 40 days, where relatives assist the new mother so she can bond with the baby. New mothers are typically served healthy, fresh meals, and sweets and prepacked foods are avoided during this time. More than 60 percent of mothers indicated they participated in some form of *cuarentena* after the birth of a child (Murray 2014). If a mother returns to work, mothers are guaranteed paid time for breastfeeding for six months after returning to work (International Baby Food Action Network 2011).

Diseases and Disorders

In 2010, the highest-ranking causes of premature death in Panama were heart disease, HIV/AIDS, and stroke (Institute for Health Metrics and Evaluation 2010). The primary causes of heart disease and stroke are related to diet, high blood pressure, and high body-mass index (BMI). In 1990, however, only 2 percent of premature deaths were caused by HIV/AIDS; by 2010, that had increased to 9 percent

of all premature deaths (Institute for Health Metrics and Evaluation 2010).

There is a high rate of HIV/AIDS among youth in Panama. Caribbean women represent 50 percent of all reported cases of HIV, and the prevalence is especially high among adolescent women, who tend to have higher rates than adolescent males (UNESCO 2010). Ministry of Health statistics on HIV/AIDS indicate that, in 2014, 37 preteens (10–14 years old) had been infected, while in 2013, 42 cases were reported. In the 15–19 age group, there were 234 cases in 2014 versus 249 in 2013 (Newsroom Panama 2014). The rate of HIV transmission for the Kuna people is approximately 45 percent higher than in the general population. It is believed that this higher HIV rate among adolescent women and the Kuna is related to the lack of sexual health information as well as an increase in the number of men who have sex with men, who tend to have female partners as well (WHO 2005). According to a 2009 survey, 86 percent of men and 82 percent of women approve of sex education (Newsroom Panama 2014). An affiliate of Planned Parenthood, the Asociacion Panamena papra el Planeamiento de la Familia, is working with adolescents on health care, with specific programs targeting HIV and AIDS (WHO 2005).

Employment

Typical Careers and Jobs

Panama's labor force consists of more than 1.4 million people, with one of the largest employers being the Panama Canal, which contributes more than 10 percent of the gross domestic product (GDP), more than any other source in the country (World Bank 2014). Sixty-three percent of Panamanians work in the services sector, as there are more than 2,000 companies in the Colón Free Zone, the second-largest duty-free zone in the world. Twenty-one percent of the workforce is employed in natural resources industries, and the remaining 16 percent are primarily in manufacturing, mining, and construction. There is also a large contingent of Panamanians who are informally employed that work as street vendors and peddlers. This is also reflected in the GDP growth rate of approximately 4 percent. Despite this participation in the workforce, 40 percent of Panamanians still live in poverty (Hassig and Quek 2007).

From 1969 to 1977, the government redistributed land (previously taken simply by anyone who wanted to clear and cultivate it) and organized farmers into groups to try

to stop overfarming and spiraling farming unemployment. Redistribution resulted in more than 18,000 families receiving lots. In addition, the government assisted farming groups by providing them with credit, training, roads, wells, and health programs (Hassig and Quek 2007).

Panama is one of the Latin American and Caribbean countries whose population largely has the potential to enjoy a medium to high standard of living, as the Panamanian economy has historically been open to trade and international investment. In contrast, the country ranks fourth in social inequality based on income distribution. There are many signs of rural and urban poverty and related shortcomings, including little access to basic services, production resources, employment, and production and transport infrastructure; limited health equipment and human resources; and a shortage of schools and teachers in remote areas (Republic of Panama 2004). The gender differential in pay for those with no formal education is probably the result of migration from rural to urban areas, where women often become employed as maids, which is less pay than men hired for labor. As for women with formal secondary or technical education, most are employed in the service sector, in clerical, secretarial, or lower management jobs (Herrera and Madrid-Aris 2000).

As of 2014, women made up 49 percent of the entire workforce, a steady increase from 39 percent in 1980 (World Bank 2016). The majority, at 88 percent, is employed in the service economy (Raad 2007). It is estimated that women in the service economy, which is about 75 percent of the workforce, are paid 58 percent of what their male counterparts make (Mordok 2007).

Pay

On average, Latin American women earn 30 percent less than men with similar skills. In the public sector, there is a greater than one-third wage gap between men and women (Ruiz and Rivera 2004). While Panama has a relatively high rate of female enrollment in higher education, many female graduates are still forced to take low-paying jobs. At all education levels, the income gap between men and women persists as women's salaries are 70–80 percent of men's salaries (DevTech Systems 2004).

The Equal Opportunities for Women law in Panama provides for women's equal treatment in the workplace, and women's right to equal pay is set out in the constitution. Panamanian law provides for an eight-hour day, a six-day week, minimum wages, one month's vacation with

pay, maternity benefits, equal pay for women, and restrictions on the employment of minors. The minimum wage was raised to USD\$2.92–USD\$3.76 per hour based on a 45-hour work week, depending on which zone an employee works in (CentralAmericaData.com 2016). All employees are entitled to a one-month annual bonus in three equal installments, two of which the worker receives directly and one of which is paid into the Social Security Fund. Employed women receive at least 14 weeks of maternity leave (Rognoni and Navarrete 2014). Numerous groups and organizations continue to work toward women's rights, including (but not limited to) the Inter-American Commission of Women, the Panamanian Observatory against Gender Violence, and the Asociacion Panamena Para El Planeamiento de la Familia (Panamanian Association for Family Planning) (IPPF 2014).

Family Life

Panamanian men and women typically choose their own spouses, although the formal ceremony does not always precede children. Children born out of wedlock in Panama do not carry a stigma. Typically, although certainly not always, middle- and upper-class Panamanians engage in formal wedding rituals before having children, particularly when marriage maintains or enhances a family's social status. Children tend to live with parents until they marry, and sometimes even into the marriage, particularly in rural areas. Marriages are typically celebrated with festivals, often called a *fiesta*, and involve a religious ceremony (Hassig and Quek 2007).

Within indigenous communities, most couples are from the same ethnic group, and marriage is often viewed as the most important event in a person's life. Marriage rituals typically reflect their cultural practices. The Ngobe-Bugle view marriage as the most important life event, and fathers often arrange marriages based off landholding, wealth, or social position. In some cases, polygamy is an acceptable alternative, particularly marrying the sister of an existing spouse so they can raise their children in the same household. In Kuna families, couples hope for a girl so she will bring a son-in-law into the family, as the new couple is absorbed into the woman's family (Hassig and Quek 2007).

The overwhelming majority of Panamanian couples have children (Hassig and Quek 2007). Infants in Panama, particularly those in rural indigenous groups, often face malnutrition and inadequate medical care related

to poverty, although Panama's Family Code establishes medical and health services as well as access to food free of charge to expectant mothers and during childbirth (CEDAW 2010). The average Panamanian family consists of four or five family members, and 22 percent of those families are headed by a female (Hassig and Quek 2007).

The ideal family unit for most Panamanians is the nuclear family of a married couple and their children (Countries and Their Cultures 2014). The Kuna Indians, however, prefer to have new husbands live with their brides in the latter's house. These then become extended families around a grandmother, her husband, and her married daughter (DevTech Systems 2004).

In the Panamanian family, male and female gender roles vary. The female gender roles consist of child care, cooking, household chores, minimal farming, making clothing for family and making bead art by hand to sell at local markets. Some of the male gender roles consist of full-time employment outside of the home, making items by hand to sell at local markets, working in the fishing or forestry industry, farming, and maintaining heavy household work (Barriteau 2014).

Marriage

Under Panama's Family Code, the minimum age for opposite-sex marriage with parental consent is 16 for males and 14 for females, and it is 18 for both without parental consent (UNSD 2008). Panamanian law "provides that women and men may freely choose their spouse and enter into marriage by their own free will" (CEDAW 2010, 37). Concerning early marriage, according to 2002–2012 data, 3.8 percent of children were married by the age of 15 and 22.2 percent by the age of 18 (UNICEF 2013). Women, both married and unmarried, can be heads of household in Panama (World Bank 2014).

Sexuality

The traditional Hispanic concepts of machismo and marianismo provide a sexual double standard, as male sexual promiscuity is viewed as a sign of virility while there is an equally strong emphasis on female virginity and purity (Pankake 2011, 1068).

Same-sex sexual activity is legal as of 2008 (Charman 2008), with an age of consent of 18. There is no legal recognition of same-sex couples, and a proposal that would have provided for same-sex civil unions was defeated in 2004, mainly due to pressure on the government from the

Catholic Church. Twelve percent of Panamanians support state recognition of same-sex marriage (Charman 2008).

According to the United Nations, the annual population rate of change for 2005–2010 was expected to be 1.8 percent, a rate the government viewed as too high; it addressed the relatively high fertility rate with family life and sexuality education programs in primary and secondary schools. Luis Soane, the coordinator for the Panamanian Coalition for Comprehensive Sexuality Education, states that the age of initiation of sexual intercourse has declined in recent years (Newsroom Panama 2014).

Double Bind

Gender discrimination is reflected in the labor market through the sexual division of labor, as women bear the responsibility of caring for the family, while men are responsible for seeking sustenance. This distribution of opposite roles forms the basis of women's positioning toward employment; women have had to give up work or combine it with domestic work, in a model of "double presence," which explains the multiplicity of roles that women assume today. Women split their time, attention, spaces, and energy to make it possible for the house to function as if it were a full-time occupation, resulting in a marked inequity in the use of time and distribution of work (De Leon n.d.).

Politics

Panama is a constitutional democracy, with a constitution that was updated in 1983, 1994, and 2004, and has executive, legislative, and judicial branches of government. The president and vice president are elected for 5-year terms, and the president appoints a cabinet of ministers (Hassig and Quek 2007). Currently, 31 percent of all ministerial positions are held by women (CEDAW 2010). The president also appoints nine judges to serve a 10-year term on the Supreme Court. Local government is organized around 65 districts and 505 subdistricts. Voters choose mayors and councillors in each of these areas. For approximately 50 years, a few political parties have achieved prominence, including the Democratic Revolutionary Party, the Arnulfista Party, the Mother Earth Party, the National Liberal Republic movement, the Christian Democratic Party, the Morena Party, the Renovación Civilista, and the Partido Solidaridad (Hassig and Quek 2007).

The constitution assures that government authorities can only prosecute citizens for violations of the constitution or the law. Arrests may result from response to complaints made to the police or from direct action on the part of police at the scene of the crime or disturbance. The police may not hold persons for more than 24 hours without being brought before the appropriate authorities or being charged with an offense. The constitution forbids arrest or detention for violation of purely civil obligations or for debts (Ropp 1987). During the course of an investigation, the accused and all witnesses are questioned, the latter under oath. The constitution guarantees that no accused person may be forced to incriminate himself or herself, and authorities are forbidden to force testimony from any close relative. Investigators may enter a person's home only with consent or a search warrant from a competent authority or to assist victims (Ropp 1987).

In early 1999, Panama's largest political parties agreed to ban anonymous campaign contributions in an effort to stem the infiltration of drug money into the political process. Nevertheless, widespread corruption of the governmental apparatus indicates the difficulty in enforcing any such bans (Freedom House 2015).

Freedom of assembly is generally recognized, and non-governmental organizations (NGOs) are free to organize. Although only about 10 percent of the labor force is in a labor union, unions are well organized and powerful. The government has issued decrees that do not allow union organization in export-processing zones. The judicial system, headed by the Supreme Court, was revamped in 1990. However, it remains overworked, and its administration is inefficient, politicized, and prone to corruption (Freedom House 2015).

The Panamanian Defense Force (PDF) was dismantled after 1989, and the military was formally abolished in 1994. However, the civilian-run Panamanian Public Forces (the national police) that replaced the PDF, although accountable to civilian authorities through a publicly disclosed budget, are poorly disciplined and corrupt. There are four components of the force: the Panamanian National Police, the National Maritime Service, the National Air Service, and the Institutional Protection Service (Freedom House 2015).

Panama's Constitution protects freedom of speech and of the press, but these rights are not consistently upheld in practice. Libel is a criminal offense, though no one has been jailed for it since 2008. Independent or critical journalists and outlets face pressure from the government

(Freedom House 2015). The UN Human Rights Council expressed concerns in 2015 about discrimination and lack of opportunities for women, indigenous peoples, and children. They noted the high rates of illiteracy in indigenous women, although the illiteracy rate has fallen for the general population by about 3 percent (CEDAW 2010). In addition, the number of underage children working was deemed shocking, with an increase of 25 percent in five years (Cultural Survival 2015).

In 1925, the Kuna Indians rebelled and declared themselves an independent state, and today they remain politically autonomous. Kuna political life centers on a nightly gathering of the community, where the men, who form the congress, meet with chiefs to discuss business. These gatherings also allow the Kuna people to resolve differences through mutual consensus. Several times a year, every village sends at least one chief to a general congress (Hassig and Quek 2007).

Religious and Cultural Roles

Catholicism came to Panama in the 16th century via Spain. Devout Catholics visit church and attend to their religious needs daily, whereas those who are more liberal follow a more traditional religious calendar. While the constitution allows citizens to choose their own religion, it does not call for separation of church and state; clergy members are not allowed to hold public office except under specific circumstances. Foreign clergy in Panama are granted the same religious freedoms as citizens (Hassig and Quek 2007). Many of Panama's national holidays are also religious, including Easter, Christmas, Shrove Tuesday, Maundy Thursday, Good Friday, All Souls' Day, and Immaculate Conception Day. Almost all Panamanian heads of government have been Roman Catholic. Rural Panamanians are often Roman Catholic, although folk beliefs often blend with Catholic beliefs. For example, Jesus Christ is viewed as one of many saints and is not central to the faith, as in traditional Catholicism. Parents begin children's religious instruction at an early age, with mothers frequently taking children to daily mass. Despite the small percentage of Baha'is in Panama, the country contains one of seven Baha'i houses of worship worldwide (Hassig and Quek 2007).

Indigenous peoples typically practice faiths specific to their own group. For example, Kunas believe in ritual, particularly the ritual of *inna-nega*, a form of "coming out" party for young women who reach puberty. In addition, they believe in reincarnation and try to strive for achievement

in this life. The Emberas worship their own gods and have their own religious ceremonies. The Ngobe-Bugle embrace a more ritualistic faith, with music and celebration at the heart of much of what they do. Similar to the Kunas, they too have a "coming out" party at the onset of puberty, called a *guro*, but theirs is for boys (Hassig and Quek 2007).

Issues

Violence

Domestic violence is a serious problem. The Family Code criminalizes rape, spousal rape, and family violence, including psychological, physical, or sexual abuse, and assigns prison terms of one to five years. Convictions for rape and domestic violence are rare, as victims generally choose spousal therapy over prosecution. Abusers are commonly convicted of unintentional killing in cases of spousal death. Between January and September 2007, there were 1,224 registered cases of domestic violence, 588 cases of rape, and 120 cases of attempted rape. Panama's Judicial Technical Police investigated each case it received that year. The Foundation for the Promotion of Woman and the Center of Colón Women along with other advocacy groups and government agencies provide education and support to survivors (U.S. Department of State 2007b).

Panama's cities experience violent crime, including shootings, muggings, theft, and kidnapping. The city of Colón is particularly dangerous, and Panama City has experienced kidnappings. Credit card and ATM card fraud is common. Panama City has a curfew for people younger than 18. Panama shares its southern border with Colombia, and drug trafficking activities occur in Darien Province, including kidnappings and murders. The Revolutionary Armed Forces of Colombia (FARC), a terrorist group, also uses the border region for its activities (Potter n.d.).

LGBT Community

There are no laws protecting LGBT people from discrimination. Article 39 of the Constitution forbids the creation of "companies, associations or foundations" that are contrary to moral or legal order. In the past, this has been used to refuse registration of gay organizations. Panama's first lesbian and gay organization, Asociación Hombres y Mujeres Nuevos de Panamá (AHMNP) (New Men and Women Association of Panama), was founded in 1996. It received legal recognition in 2005 after a three-year battle with the authorities and the Catholic Church. It is still the

only gay and lesbian organization in Panama. In 2004, they presented a petition calling for partnership rights. In June 2005, Panama's first Gay Pride March was held with 100 AHMNP demonstrators.

Poverty

Approximately 40 percent of the Panamanian population lives in poverty (World Bank 2014). Political instability; economic collapse; foreign invasion, primarily from the United States; and development all factor into growing economic inequality, as internationalization profits some, but not all, making sustainable economic growth difficult (King n.d.). Urban citizens tend to be healthier and better educated than rural citizens, leading to an ever-widening socioeconomic gap. Data from the last 30 years indicates that, despite the economy's steady growth during this time, the nation's level of inequality has not significantly improved. It is widely viewed that a "business as usual" policy should cause alarm for Panamanian leaders, for any strides being made in poverty reduction are not being distributed evenly among the population. Government initiatives are viewed as making a good start for the future but provide little short-term reduction in inequality (King n.d.).

Two large-scale social programs are working to combat poverty and its effects, the Get Ahead for Panama program, which focuses on literacy for those excluded from formal education programs, and the Opportunities Network Program, which guarantees health care and education for poor families (CEDAW 2010). The Opportunities Network Program has had a direct effect on indigenous women, as it provides financial support to rural and indigenous women who are heads of household and ensures their children receive health care and stay in school (CEDAW 2010). The Office of the First Lady runs an additional program, the United Families Program, which lends health care, nutritional, and educational support to rural women (CEDAW 2010).

Sex and Human Trafficking

Panama is a source, transit, and destination country for women and children subjected to trafficking in persons, specifically forced prostitution. Although some women and girls are found in forced prostitution in other countries in Latin America and in Europe, most trafficking victims are exploited within the country. Although statistics are lacking, both NGOs and government officials

anecdotally report that commercial sexual exploitation of children was greater in rural areas and in the city of Colón than in Panama City. NGOs report that some Panamanian children, mostly young girls, are subjected to involuntary domestic servitude. Most foreign sex trafficking victims are adult women from Colombia, the Dominican Republic, and neighboring Central American countries; some victims migrate voluntarily to Panama to work but are subsequently forced into prostitution. Weak controls along Panama's borders make the nation an easy transit point for irregular migrants from Latin America, East Africa, and Asia, some of whom may fall victim to human trafficking. The Panamanian government does not fully comply with the minimum standards for the elimination of trafficking; however, it is making significant efforts to do so. Authorities have increased public awareness about the prostitution of children through seminars in schools and an outreach campaign with the tourism sector. Despite such efforts, there is little evidence of progress (U.S. Department of State 2007a).

Article 178 of the Panamanian Penal Code prohibits the internal and transnational movement of persons for the purpose of sexual servitude or forced commercial sexual activity. The prescribed sentence is 4–6 years' imprisonment, which is increased to 6–9 years if trafficking offenders use deceit, coercion, or retain identity documents, and it is further increased to 10–15 years if the victim is under 14 years of age. Article 177 prohibits sexually exploiting another person for profit (U.S. Department of State 2007a).

Beauty Standards

Skin color and hair texture are extremely important for daily definitions of beauty and identity. These two elements determine whether a person is called a *culisa* (a mixture of black and Indian, mostly applied to women with brown skin and straight hair); a *chombo blanco* (a person with light skin color and extremely curly, "kinky" hair); a *Pania* (a white or Latino person who speaks Spanish and has light features and straight hair); or a *gringo/gringa* (white man or woman from the United States or Europe) (Guerron Montero 2012, 21). Standards of beauty still rest heavily on how closely one approximates a European ideal, reinforcing a racial dimension to the issue of gender and status (Wiltshire-Brodber 1999, 137).

Throughout Latin America, skin tone is a major marker of status and a form of symbolic capital, despite national

ideologies of racial democracy. Skin tone, along with other phenotypical traits, is a significant marker of social status, with lightness signifying purity and beauty and darkness signifying contamination and ugliness (Stepan 1991, 135). A few organizations, including Woody's House of Hope, FRIDA, and the Central American Women's Fund, address beauty standards and norming for girls and women (FRIDA 2016).

Paraguay

Overview of Country

The Republic of Paraguay is a landlocked country in South America bordered by Argentina to the southeast, Brazil to the east and northeast, and Bolivia to the northwest. Given its central location within South America, Paraguay is commonly referred to as the "heart of America." As of July 2014, the population is about 6.7 million inhabitants. However, the country's population is not evenly distributed. Most Paraguayans live in the eastern region of the country within 100 miles of the capital city of Asunción, the largest city (CIA 2014). The Gran Chaco, an arid and hot lowland region of the Río de la Plata basin divided among Bolivia, Paraguay, northern Argentina, and a portion of the Brazilian states of Mato Grosso and Mato Grosso do Sul, accounts for approximately 60 percent of Paraguayan territory. Yet, Paraguay's portion of the Gran Chaco is home to less than 20 percent of the nation's overall population (Secretaría Nacional de Turismo 2014). Roughly 62 percent of the population lives in urban spaces (CIA 2014). Although the male-to-female ratio for the overall population is fairly even, Paraguay has a slightly greater percentage of male citizens. Like its Latin American neighbors, Paraguay is largely a Roman Catholic country. Roughly 90 percent identify as Roman Catholic (Baldauf and Kaplan 2007, 30).

Paraguay has historically been a country of emigration due to periods of political instability and civil war, but the nation has also had moments of sizable immigration. Significant immigration began in the 19th century following the nation's profound population loss during the Paraguayan War (1864–1870), also known as the War of the Triple Alliance or (more commonly in Paraguay) the Great War. The conflict began in 1864 between Paraguay and the triple alliance of Argentina, Brazil, and Uruguay. The fighting resulted in nearly 400,000 deaths and proved disastrous for Paraguay. The nation lost roughly 30 percent of its population, though some scholars have estimated that the population loss was as high as 70 percent (Crow 1992, 604–606). Compounding the large death toll, Paraguay was forced to cede portions of its territory to Argentina and Brazil. As Paraguay moved into the 20th and 21st centuries, it witnessed continued and diversified immigration. The population has gained sizable numbers of immigrants from countries such as Germany, France, Italy, Japan, China, Korea, Ukraine, Argentina, and Brazil. Since the 1960s, many Brazilians have arrived to work in the nation's large agriculture industry (CIA 2014).

Still, Paraguay continues to be characterized by considerable emigration. In previous decades, many Paraguayans relocated to neighboring Argentina, Brazil, and Uruguay—as well as more distant nations such as the United States, Italy, France, and Spain (CIA 2014). One of the major factors contributing to the country's prolonged history of emigration is a high poverty rate. Poverty is particularly palpable in rural areas, where more than one-third live below the poverty line. Compared to other Latin America nations, Paraguay suffers from greater rates of income inequality (CIA 2014).

Roughly 95 percent of Paraguay's population is *mestizo* (a mixture of Spanish and indigenous descent), and the nation's indigenous history and heritage are most felt through language (Melià 1992, 299). There are also sizable Afro-Paraguayan communities throughout the country, particularly near Asunción (Pedro 2000). There are two official languages: Spanish and Guaraní. The indigenous Guaraní are distinguished from the indigenous Tupinambá (located especially in the region between the Uruguay and the Paraguay Rivers as well as in parts of Argentina, Brazil, Uruguay, and Bolivia) by their use of the Guaraní language (Melià 1992, 242). The Guaraní language represents a subfamily of the Tupian languages and is sometimes referred to as “Tupí-Guaraní.” Guaraní is officially taught in public schools and learned informally

through social interaction. The term *Guaraní* has been commonly used across Latin America to refer to any citizen of Paraguay, in the same way citizens of France are sometimes called *Gauls*. Approximately 94 percent of the population is literate in at least one of Paraguay's official languages (CIA 2014).

Overview of Women's Lives

Paraguayan women live in a diverse culture that has been undergoing rapid changes in recent decades. Although women's rights have expanded because of constitutional and legal changes in the 1990s, dominant cultural attitudes toward women and girls have been developing more slowly. While the lives of women and girls have steadily improved, females still struggle to attain full social and economic equality, which is reflected in its Gender Gap Index ranking of 71st out of a possible 135 countries (UNDP 2014a). A nation's Gender Gap Index (also called a Gender Inequality Index (GII)) reflects gender-based inequality in dimensions such as reproductive health, political empowerment, employment, and economic activity.

Girls and Teens

Despite the large number of teen pregnancies in the country's forest zones, female adolescent fertility has been declining in recent years. In fact, Paraguay is one of only four countries in the region (along with Belize, Guatemala, and Nicaragua) that has seen that percentage decline (CIA 2014). The legal age for marriage in Paraguay is 16. The percentage for early marriage (women between the ages of 15 and 19) is only 12 percent, but the adolescent fertility rate (the percentage of women between the ages of 15 and 19 per 1,000 births) is 65 percent (CIA 2014).

Education

Historically, Paraguay has not placed a high value on female education. During the long and repressive dictatorship of Alfredo Stroessner (1954–1989), the longest unbroken rule by any individual in South America, education was overlooked in favor of economic concerns, and teacher salaries fell to extreme lows (Lewis 1980, 131). The constitution of 1992, the country's sixth since it gained independence from Spain in 1811, attempted to remedy the long neglect of education. Article 85 of the Constitution mandates that 20 percent of the government budget

must be allocated to education (Library of Congress 2005, 8). However, this measure has proven to be largely impractical and is often ignored.

Almost 96 percent of girls are enrolled in primary school, but this percentage remains lower than that of boys, which is more than 99 percent (UNICEF 2014). Homework is considered very important for both girls and boys at the primary school level. Secondary school enrollment for teen girls is considerably lower than female enrollment in primary schools. Just over 63 percent of teen girls are enrolled in secondary schools (UNICEF 2014). This is slightly larger than the male percentage (approximately 59%), which reflects young men entering the labor force at a greater (and quicker) rate than their female counterparts (UNICEF 2014).

In recent decades, the government has expanded tertiary education. Between 2000 and 2001, the state established 35 universities across Paraguay (Ministerio de Educación y Cultura 2014). In total, there are 53 universities; 8 are public, and the remaining 45 are private (Ministerio de Educación y Cultura 2014). Forty-three percent of college-age females are enrolled in university education, compared to only 30 percent of college-age males (Ministerio de Educación y Cultura 2014). The expansion in tertiary education, especially for females, represents a major accomplishment for Paraguay, which in 1995 had approximately only 10 percent enrollment in university education for males and females combined (Ministerio de Educación y Cultura 2014). The increased percentage of teen girls in secondary schools and young women in universities is perhaps one reason behind the nation's slightly higher adult literacy rate for females, which is 98–99 percent (UNICEF 2014). However, it is important to note that these numbers represent overall percentages for Paraguay. There is great variation in percentages and statistics from city to city as well as between white, mestizo, and black (West African descent) inhabitants, and especially between urban and rural spaces. Still, despite some differences in percentages between females and males, the World Economic Forum reports that Paraguay has reached gender parity in primary, secondary, and tertiary education (CIA 2014).

It has proven difficult for teen girls (particularly Guraní girls) in provincial and forest regions to gain access to education past junior high school, and many do not have access to any formal education. In Paraguay's forest zones, many girls are sold into human trafficking and prostitution—eliminating the chances of gaining an

education (Global Giving 2014). Additionally, adolescent pregnancy is significantly more prevalent in Paraguay's forest region, further hindering girls' ability to attend secondary school.

Health

In 1999, the Paraguayan government passed a National Policy for Comprehensive Health Care for Women, marking a watershed moment in women's health.

Maternal Health

Although the policy has improved women's access to health care, maternal mortality remains a key issue facing women. Statistics show that Paraguay's maternal and infant mortality rates (especially outside of Asunción) are among the highest in Latin America (CEPAL 2014).

Access to Health

The Paraguayan government does subsidize health care. However, women in rural areas suffer more than those in urban centers. Only 15 percent of Paraguayans in rural areas have access to safe drinking water, and only 42 percent have access to medical care. In recent years, the government and nongovernmental organizations (NGOs) have worked together to raise awareness regarding access to health care, reproductive rights, and family planning (CEPAL 2014).

Diseases and Disorders

A major unresolved challenge is the spread of HIV/AIDS infections among women. The government has allocated additional funding in recent years to AIDS research and has worked to spread awareness and encourage nondiscrimination in schools and the workplace (CEPAL 2014). Domestic violence is also an issue affecting women's health.

Since 2000, the number of reported cases of violence against women has been steadily increasing. This violence includes physical, psychological, economic, and sexual abuse. The most reported forms of violence against women are psychological, followed by economic, physical, and sexual (UNFPA 2014). Studies reveal that women across class, racial, and economic divides have filed complaints of abuse and violence. The most common perpetrator in reported cases is either a woman's husband or boyfriend (UNFPA 2014).

Employment

In nearly all of the available statistics and data for employment, women trail behind their male counterparts. Yet, statistical evidence reveals only part of the story. Paraguay is a largely mestizo country, but, unfortunately, most available statistical data do not distinguish between differing racial classifications—particularly between nonwhite groups. Important statistics do speak to the nation's gendered division of labor. As of 2012, 59 percent of females were participating in the labor force and were characterized by the Paraguayan state as “economically active.” Males, however, accounted for 88 percent of the “economically active” population (World Economic Forum 2016). Such disparities are particularly evident in management positions and senior-level jobs. Only 34 percent of women hold management or senior-level positions, a sharp contrast to the 66 percent of males that occupy similar positions (Ulandssekretariatet 2013, 14).

Such a gender gap is also evident in the realm of professional and technical workers as well as the nation's unemployment rate, where overall, 3 percent of men characterize themselves as unemployed and 4 percent of females report not having stable employment (World Economic Forum 2016). Although yearly income varies greatly by position and educational level, on average, males have a significantly higher earned income than their female contemporaries, \$11,168USD for men compared to \$6,586USD for women (World Economic Forum 2016). Paraguay's Gender Gap Index employment dimension ranked it second to last, with only political empowerment garnering a lower rating (UNDP 2014b).

Women in the workforce receive 12 weeks of maternity leave and are awarded 50 percent of their wages over the first 9 weeks of leave. Once women return to work, there are private and public day care services available to families, but these services are restricted by allowances and are (normally) only for children between birth and five years old (UNFPA 2014). The labor market is one of the areas least covered by national policies targeted at women's rights and gender equality. There have been measures to reduce employment inequality between men and women. In 2003, for example, Act no. 2263 equalized social security benefits and pensions for men and women. Also in 2003, in the capital city of Asunción, the government approved the creation of a “category A” driver's license for women, which permits them to secure jobs driving vehicles such as taxis, buses, and trucks (UNFPA 2014). The expanded

driver's license was accompanied by the bill *Mujeres al Volante* (Women at the Wheel), which encourages women's employment in this sector (UNFPA 2014).

Despite these reform efforts, employment inequality between men and women remains a grave problem. Although poverty is widespread throughout the country, studies indicate that women head the majority of households living in poverty. Across Paraguay, women head more than 25 percent of households, 30 percent of which live in urban areas (UNDP 2014b). Women often face segmented labor markets that place them in occupations of lower status and social recognition; as a result, women also face lower remuneration (UNDP 2014b). Women are also largely confined to domestic labor or unpaid family work. Domestic labor has proven to be a vulnerable form of employment for women due to physical and sexual abuse. The risk of being physically or sexually mistreated in the workplace further complicates female labor outside the home. Additionally, domestic work does not allow women access to credit or social security. This is particularly impactful given that social security is responsible for providing women with maternity coverage. For female domestics, workdays are often long and with low financial compensation. Men are almost never employed in the realm of domestic service (UNFPA 2014). The nation's Labor Code provides major differences in the protection of domestic work vis-à-vis other forms of employment. The Labor Code permits domestic work to be as long as 12 hours per day, and wages may be up to 40 percent less than the country's standard minimum wage (UNFPA 2014).

In contrast to the limitations of women in urban centers (where domestic labor is the primary means of employment), women in more rural and provincial settings have found work in the agricultural industry. Since 2000, roughly 20 percent of women have worked in agriculture (UNDP 2014b). Beginning in 2002, the Paraguayan government established measures to ensure equal access for women (particularly Guaraní women) to acquire resources such as land and credit in the rural economy—hoping to both encourage women to enter the agricultural field and to help eliminate gender inequality (UNDP 2014b). Although many women work in domestic service and agriculture, they have also established themselves in more prominent positions, such as education.

Women moving through the educational system to the university level are finding positions in many previously male-dominated fields, such as media and communications.

Recently, 63 percent of graduates with communications degrees at the Catholic University were women, and there has been a steady increase in the proportion of females working in journalism. Yet, in media and communications, as in many other fields, women face uneven pay scales (UNFPA 2014). Thus, while it appears there have indeed been improvements to gender inequality in the realm of employment and that structural changes are coming, the Paraguayan government still has no specific policies of guaranteeing employment equity.

Family Life

While there are many issues surrounding family life that have occupied public and state discourse in recent decades, perhaps no issue has received more attention than domestic violence. In 2000, the Paraguayan state passed the Domestic Violence Act, which guaranteed women and men a life free of physical, psychological, and sexual violence (UNFPA 2014). However, this act has proven to be inconsistent with the Paraguayan Penal Code. The Penal Code only considers physical abuse a form of domestic violence, and even when the aggressor is convicted, the punishment typically only consists of a fine (UNFPA 2014).

Various groups have begun engineering awareness campaigns to stop the spread of domestic violence and change the Penal Code, such as the 1998 campaign Against Sexual Harassment instituted by the Labor Union Congress. Additionally, the Paraguayan Women's Bureau has carried out radio programs in Asunción and elsewhere to support awareness (UNFPA 2014). Despite these efforts, calls to police reporting domestic abuse are still one of the most recurring categories of any type of emergency call (UNFPA 2014). Like other issues, domestic violence is lessening, but the process has been slow moving.

Currently there are no government policies designed to achieve a more equal distribution of familial responsibilities between men and women. The government has tried to amend unequal familial responsibilities. In more urban areas, for example, the state has worked to place child care facilities closer to men's places of work so that fathers (not just mothers) can take responsibility for transporting their children when both parents work outside the home (UNFPA 2014). While there is a division of familial labor between men and women throughout the country, it is particularly evident in rural and farming families. In most rural areas, women are responsible for obtaining and transporting water, which can often prove difficult and

dangerous in rough currents. In August of 1999, for example, a 50-day drought forced women to walk 3–4 miles (5–7 km) to fetch freshwater from the Apa River (UNFPA 2014). Men are responsible for work in the fields, and when the quality of production is low, rural families face an unbalanced and unhealthy diet (UNFPA 2014). Women often raise small animals. In rural areas, men are generally considered the heads of household, and women are primarily considered mothers above all else (UNFPA 2014).

This has begun to change (gradually) in more rural regions due to increased poverty. The agricultural economy has begun to decompose, and, as a result, there has been an erosion of economic dynamism. The poor economic trajectory has engendered increasingly sizable migration, especially among women. Paraguayan women account for almost 60 percent of migrants to Argentina seeking greater and more varied economic opportunities, and over 45 percent of these migrants are female heads of families (Cerrutti and Magali 2008). Chains of help often assist women's independent migration, particularly aid from sisters as well as assistance from other relatives and friends (Cerrutti and Magali 2008).

Often families form early because it is considered socially unacceptable for women of a certain age (generally 23) to be unmarried. Rarely do women live alone, even if single. Single women still tend to live with their immediate family. Even when daughters get married, they frequently visit their parents and extended family. It is common for married women to live close to their parents (UNICEF 2014).

Marriage is only considered legitimate between men and women. The 1992 constitution legally prohibits LGBT couples from entering into marriage. Although LGBT activity is indeed legal (as it has been since 1880), these households are not eligible for the same protection as opposite-sex married couples. Homosexuals tend to be more discreet in Paraguay than places where LGBT marriage is legal and usually go to more private places to feel more comfortable (SomosGay 2014). In 2010, the organization SomosGay (We Are Gay) submitted a same-sex marriage bill to Parliament, but, as of 2014, same-sex marriage remains illegal (SomosGay 2014). There are also different rules for the LGBT community. For example, the legal age for consent for heterosexual couples is 14. However, the legal age of consent for homosexuals is 16 (SomosGay 2014). Since LGBT marriage is unsanctioned, it is difficult for LGBT parents to adopt children. Although LGBT adoption is legal in other Latin American countries,

such as Argentina, Brazil, Uruguay, and French Guiana, it is illegal in Paraguay (SomosGay 2014). Even though LGBT adoption is illegal, there is no constitutional ban on such adoptions, as there is in nations such as Ecuador and Honduras (SomosGay 2014).

Politics

In 1961, women gained the right to vote, the last country in Latin America to grant female suffrage. Women's role in politics intensified in the 1980s when many women protested the oppressive dictatorship of Alfredo Stroessner, particularly through trade union activism (Díaz 2009). This was an important political development for women, as they were not permitted to organize and campaign for improved legal rights until Stroessner was overthrown. In 1989 (the year Stroessner's rule ended), two groups emerged: the Paraguayan Women's Coordinating Committee (composed of 11 groups) and the Multisectorial Women's Group, which no longer exists (CEDAW 2011). In 1991, women's organizations held two public forums and presented proposals to the constituent assembly in charge of rewriting the nation's constitution, an important development, as only 21 members of the almost 200-member assembly were women (CEDAW 2011).

Because of these organizing efforts, the 1992 constitution incorporated the principal of gender equality, though this has not always been applied in practice. In 1992, Paraguay created the Secretariat of Women's Affairs, which holds a ministerial rank and functions as a specialized branch of the Paraguayan government (Díaz 2009). The ongoing lack of female representation helps explain the lack of legislation protecting women, such as laws pertaining to domestic violence.

Unlike many of its Latin American neighbors (Argentina, Chile, Brazil, Costa Rica, Panama, Ecuador, Nicaragua, and Bolivia), Paraguay has never had a female head of state. In the 2008 presidential election, Blanca Ovelar (1957–) was the candidate for the Colorado Party, which had governed the country for over 60 years. That said, Ovelar faced internal resistance and was disparaged by some members of her own party (Díaz 2009). More recently (2013), Lilian Soto (1962–) ran for president as a member of the feminist party *Kuña Pyrenda* ("Platform" in Guaraní), which was created in 2010). Soto, a surgeon and graduate of the University of Ottio, lost to current president Horacio Cartes (1956–), a tobacco magnate. Although Soto only received 3,925 votes out of a possible 2,409,437,

less than 70 percent of registered voters turned out at the polls, a continual problem (Legrand 2013).

Soto and her Platform Party have struggled for the legalization of abortion. Like many Latin American countries, clandestine abortions are a leading cause of mortality for young women (Legrand 2013). Soto has also been an avid supporter of gay marriage and LGBT rights as well as protection for minorities against discrimination (Legrand 2013). Journalists on the campaign trail often harried Soto due to persistent questions concerning her status as a single woman without children. Her private life became such a distraction that she was forced to publicly proclaim, "No, I am not a lesbian," to a swarm of reporters (Legrand 2013). She has emphasized a rethinking of Paraguayan historical consciousness—emphasizing how women helped rebuild Paraguay after the nation's devastating loss in the War of the Triple Alliance. The Platform Party produced posters that read, "If women were able to rebuild Paraguay after war, I want women to govern my country in 2013" (Legrand 2013).

Soto was in the public spotlight before her presidential run in 2013 as the former secretary of state for public service in the center-left government of Fernando Lugo (2008–2012). Lugo, who labeled himself the "bishop of the poor," was ousted by the Paraguayan Parliament and impeached after a coup d'état. In June of 2012, 17 people were killed in a clash between landless farmers and police that were attempting to evict them. This served as a pretext for Parliament to expel Lugo, and the Chamber of Deputies cited this event along with growing insecurity, nepotism, and a controversial land purchase as reasons to impeach Lugo with a vote of 76 to 1 (Supreme Electoral Justice Tribunal 2013). Additionally, Lugo faced controversy during his administration when it was revealed he had fathered a child while he was a priest. The child's mother, Viviana Carillo, also claimed Lugo had beaten her (Legrand 2013).

While serving in the Lugo administration, Soto served as an activist against violence targeted at women and was a vocal defender of mothers' rights. During her presidential run, as well as her time in the Lugo administration, Soto asserted that Paraguay was still rife with polygamy. Although Soto addressed many issues concerning women and low-income families, she was not as vocal on issues affecting many indigenous communities, such as the protection of ancestral lands and forced eviction (UNFPA 2014).

While women have not had success attaining the presidency, they have had limited success in Parliament.

Women accounted for 15 percent of the seats in Parliament, though that is below the overall percentage for Latin America and the Caribbean (World Economic Forum 2016). Paraguay's overall percentage of woman in Parliament currently ranks 98th out of a possible 135 countries (World Economic Forum 2016). As of 2016, only 8 percent of women held ministerial positions, and female empowerment ranked 120th out of 135 countries (World Economic Forum 2016). Despite these low numbers, Paraguay has made strides in recent decades. In 1996, the country set hopes for a 20 percent quota for women on a candidates' list. This percentage is in line with many of the other Latin American countries (Argentina, Bolivia, Brazil, Costa Rica, the Dominican Republic, Ecuador, Honduras, Mexico, Panama, and Uruguay) that have set the proportion of female candidates as between 20 percent and 50 percent (UNFPA 2014). This has helped counterbalance resistance to female political participation from traditional parties, who hold a majority in Parliament (UNFPA 2014). Breaking with a long-standing culture of patriarchy and an older European-style of Parliament has proven difficult.

Religious and Cultural Roles

According to the most recent data (provided by the 2002 census), approximately 90 percent of Paraguayans identify as Catholics, and only roughly 2 percent identify themselves as having no religious affiliation. The remaining 8 percent classify themselves as Jews, Muslims, or followers of traditional indigenous faiths (UNFPA 2014). The ubiquity of Catholicism is a result of centuries of Christian European missionary activities in the region, particularly during the Latin American colonial period (1490s–1820s). This period saw the construction of numerous churches throughout the country that serve as examples of both colonial architecture and religious conversion. In 1610, for example, the Jesuits began their first mission to convert Guaraní groups to Catholicism (Burkholder and Johnson 2012, 288).

Although there were mass conversions, the process is perhaps best categorized as a form of syncretism rather than full-scale religious change. Over the centuries, folk Catholicism emerged as a prominent form of religious expression as indigenous and African women blended alternative rituals and beliefs with Catholic teaching (Sloan 2011, 71). Since the colonial period, becoming a nun has proven an alternative to marriage, though fewer women are joining the sisterhood now than in past decades (Sloan 2011).

Religion, and the ceremonies and celebrations that accompany it, has traditionally marked watershed moments in a woman's life: First Communion, marriage, the baptism of children, and the deaths of loved ones (Sloan 2011, 71). Perhaps Paraguay's most revered image is the Virgin of Caacupé, a Guaraní woman. Pope Francis described the Virgin of Caacupé as "the most glorious woman" (Tase and Barillas 2013).

Historically, women have tended to show more religiosity than their male contemporaries. Traditional Catholic families commonly display small religious statues, artwork, rosary beads, and candles in a corner of the living room and in bedrooms. Creating these displays is the responsibility of the women in each household (UNFPA 2014). Such displays of religious devotion can also be seen on outdoor patios—a space women take great pride in because it is where guests come to drink *tereré* (a drink similar to yerba mate, but prepared with cold water rather than hot). Guests drink *tereré* out of a cup called a *guampa* and a metal straw called a *bombilla* (Lambert and Nickson 2013, 1–11). In this sense, the space of the patio combines women's religious and cultural roles in Paraguayan society. Women are responsible for decorating the space in a manner that appropriately displays the family's religiosity as well as serving guests the customary cup of *tereré*.

Another prominent cultural role for women is the planning of holidays and events, such as a quinceañera, a celebration when a girl turns 15 years old. The quinceañera signifies a girl becoming a young woman. Even after a girl turns 15, it is not uncommon for her mother to accompany her to different public events, such as dances (UNFPA 2014). Another special event that women help plan and organize is the Virgin of Caacupé Day (December 8). This holiday is one of the most important and is a day when women do large amounts of cooking for their entire extended family. It is a day filled with large festivals throughout the country (UNFPA 2014). Another important religious and cultural gathering is the *novena*—the nine days of prayer after someone dies. After the prayer, the family of the deceased usually provides snacks such as candy, cookies, or *chipa* (hard cheese bread). The last day of the *novena* calls for a large lunch that is usually prepared jointly by the women in the family (UNFPA 2014).

Issues

Perhaps the biggest issue facing women in 21st-century Paraguay is human trafficking. As previously mentioned,

Paraguay's central location within South America makes it relatively easy for human traffickers to transport women across the region. Trafficked victims are often sent to Argentina, Brazil, Chile, Bolivia, France, Spain, Korea, and Japan (Footner 2008). Although all women are at risk, girls and teens of lower economic status and indigenous heritage tend to be the most recurring victims of trafficking. Women from the Paraguayan interior have emerged as prominent "merchandise" in the triple-border shopping region with Argentina and Brazil (Footner 2008). Street children, who are separated from families and communities, have little protection and are targeted. Studies estimate that nearly 85 percent of trafficking is to support sexual exploitation as well as commercial and domestic service (Footner 2008). Although trafficking is not solely a problem for women and children, estimates suggest that approximately 70 percent of trafficked victims are either women or children (Footner 2008). Some trafficked persons are victims of forced capture and movement, but many traffickers lure victims with false promises of work, especially in the domestic economy (Footner 2008).

The government has increased efforts in recent decades to halt human trafficking and spread awareness across the country. The Paraguayan state revised the Penal Code to strengthen the government's ability to prosecute international cases of trafficking. However, these changes to the Penal Code have not adequately reduced internal cases of forced labor and prostitution (UNFPA 2014). In conjunction with the changes to the Penal Code, the Paraguayan government has forged partnerships with neighboring countries and has recently hosted two antitrafficking seminars with Brazilian and Argentine antitrafficking experts. During the seminar in Asunción, approximately 300 individuals attended (Footner 2008). The government also created 12 regional workshops, highlighting the local response. In these workshops, roughly 1,000 individuals took part (Footner 2008). In recent years, there have also been numerous publicity campaigns to bring attention to human trafficking. These campaigns have made use of radio, posters, and even messages on bus tickets regarding the dangers of human trafficking (UNFPA 2014). It is not uncommon for activists against human trafficking to face threats of physical abuse or even death (UNFPA 2014).

Since the 1980s, the Paraguayan government has worked to address violence against women. The state created numerous organizations designed to offer counseling, housing, and medical care for women. There are also centers that provide female victims of abuse with legal,

psychological, and educational assistance. These organizations have been dispersed among many different ministries (UNFPA 2014). Yet, these centers are largely confined to urban spaces, particularly Asunción—and even in the nation's capital, centers generally do not have the capacity to care for the large number of abused women. Additionally, Paraguayan law stipulates that abuse must be habitual before being recognized as a crime. Even then, punishments generally only consist of a fine (UNFPA 2014).

A final issue is the nation's standard of "ideal" female beauty. Historically, Paraguay has identified "proper" female beauty with "whiteness" (which is accompanied by the appearance of straight hair). It is common for women with darker complexions to classify themselves as "white," and roughly one-third self-identify as "white" (Telles and Flores 2013, 412). Standards of beauty and desires to appear "whiter" also serve as a way for women to alter their social status and gain greater social recognition in a nation where racial and gender ideals still govern social interactions.

Peru

Overview of Country

Peru is located on the west coast of South America. The country spans an area of 496,225 square miles (1,285,216 sq. km) and is the third-largest country in South America, after Brazil and Argentina. Ecuador and Colombia neighbor it to the north, Brazil and Bolivia border it to the east and south, and a small section of Chile lies directly south. The country has three main geographic regions: the western coastal plain called the *costa*; the *sierra*, or the Andean highlands, located in the center of the country; and the *selva*, in the eastern jungle lowlands of the Amazon basin. Lake Titicaca, the world's highest navigable lake, is located at an altitude of 12,510 feet (3,814 m) on Peru's border with Bolivia. Both countries share control of the lake (CIA 2016).

Peru has three official languages: Spanish, spoken by 84.1 percent of the population; Quechua, spoken by 13 percent; and Aymara, spoken by 1.7 percent. In 2015, Peru's population was estimated at about 30.5 million. The two largest ethnic groups are Amerindian, estimated at 45 percent, and mestizo, a mixture of Amerindian and white, at 37 percent. The remainder of the population consists of 15 percent white and 3 percent black, Japanese, Chinese, and other. Almost 80 percent of Peru's population live in urban areas, and Lima, the country's capital, is the most populous city with more than 9 million inhabitants (CIA 2016).

Peru has a strong connection with its indigenous history. The Inca Empire (ca. 1400–1533 CE) was extremely powerful, controlling a large swath of land that contributed to their wealth. Although very little is known about women's roles during the Inca Empire, Chosen Women, or *aclyaconas*, were selected from the people conquered by

the Incas. These women, chosen because of their beauty at a young age, were taught how to spin and weave cloth as well as cook and other domestic work (Malpass 1996, 52). Outside of their contribution to domestic duties, Chosen Women were served as a commodity under the Incas. Highly protected and coveted by the Inca government, Chosen Women were offered as favors to established leaders and those conquered by the Incas as a way to forge alliances (53).

In 1533, the Spanish, led by Francisco Pizarro, conquered the Incas, killing their leader, Atahaulpa. The Inca Empire suffered under Spanish rule; war and infectious diseases decimated the population during the colonial period. The ruins of Machu Picchu remain as evidence of the Incan civilization and are considered an international wonder.

Spanish interest in Peru centered on its extraordinary mineral wealth, particularly silver, as well as access to land for farming and ownership. Indigenous groups united and fought against Spanish rule during the colonial period. Peru proclaimed independence from Spain on July 18, 1821, but it was not formally independent until 1824 (Library of Congress 1993, 3).

During the 20th century, the Sendero Luminoso (Shining Path) guerrilla movement plagued the country. The group followed a radical Maoist ideology and garnered support in the Ayacucho region and later throughout the Andean highlands. Initially, supporters of the guerrilla movement were frustrated with the military government's abuse of power. However, over time, the group increasingly adopted repressive actions against the intended beneficiaries of its revolution (Palmer 2008). In 1992, the government succeeded in capturing the movement's leadership, which led to its decline.

An increase in coca production to satisfy foreign demand for cocaine added to internal strife. The Peruvian government, under pressure from the United States, attempted to curb production by offering farmers incentives to substitute crops (Library of Congress 1993, 56). They also adopted crop-eradication tactics executed by military and police forces.

Challenging economic times and increasing domestic unrest during the 1980s inspired the election of a populist president. Alan García Pérez served as president from 1985 to 1990. García's impressive oratory skills helped him garner popularity ratings of more than 75 percent early in his presidency (Library of Congress 1993, 243). However, his act to nationalize the bank system severely weakened

Peruvian citizens' confidence in his leadership abilities, which eventually led to his political defeat.

In 1990, Alberto Fujimori was elected president. During his presidency, he took steps to retain complete control of the government. He was forced to resign in 2000 due to a corruption scandal and allegations of human rights abuses. Subsequently, Fujimori went into self-imposed exile. In 2007, he was extradited from Chile to Peru and tried and convicted of murder for the death-squad killings of 25 people in 1991 and 1992, resulting in a 25-year prison sentence (Palmer 2008). Alejandro Toledo Manrique, Peru's first democratically elected president of indigenous ethnicity, served as president from 2001 to 2006. During his presidency, Toledo authorized the Peruvian Truth and Reconciliation Commission to investigate the internal armed conflict, focusing its work on human rights violations. For the 2016 presidential election, Fujimori's daughter ran against Pedro Pablo Kuczynski. While some feared that she would reimplement her father's oppressive tactics if she won, in the end Kuczynski, a former investment banker, was elected.

Overview of Women's Lives

The Human Development Index (HDI) measures a country's progress in three basic dimensions of human development: opportunity for a healthy life, access to knowledge, and a suitable or appropriate standard of living. In 2014, Peru received an HDI of 0.734, placing it in the high human development category (UNDP 2015). The life expectancy was at 74.6, and expected years of schooling was 13.1. Peru's HDI has consistently increased since 1980, when its HDI was 0.577. Then, life expectancy was 60.1, and the expected years of schooling was 10.9. Despite gains, Peru's 2014 HDI is below the average of 0.744 for countries in the same development category as well as below the average for Latin American and Caribbean countries, 0.748. In comparison to Venezuela and Chile, two Latin American countries close in HDI rank and similar in population size, Peru's HDI is lower. Venezuela's HDI in 2015 was 0.762, and it was ranked 71st; Chile's HDI was 0.832, and it was ranked 42nd.

The Gender Inequality Index (GII) measures gender inequalities based on three elements: women's reproductive health, empowerment, and economic activity. Peru's GII value in 2014 was 0.406, ranking it 82nd out of 155 countries. The GII also looks at maternal mortality and adolescent birth rates as well as women in parliament and female labor market participation. In comparison to

Venezuela and Chile, Peru's rank is lower than Chile, 65th, but higher than Venezuela, 103rd (UNDP 2015).

Girls and Teens

In 2013, 28 percent of Peru's total population was between the ages of 10 and 24 (Population Reference Bureau 2013). The adolescent fertility rate, the number of births per 1,000 women ages 15–19, has consistently decreased. In 2011, the fertility rate was at 53, and in 2014, it had declined to 50 (World Bank 2016a). Peru's adolescent fertility rate is lower than Chile's and Argentina's, 56 and 54, respectively (Population Reference Bureau 2013).

The percentage of girls living in rural areas has held steady. In 1993, rural girls and women aged 14–35 comprised 4 percent of the national population. That population grew 1 percent in 2007. With respect to the national youth population, rural girls comprised 10 percent in 1993 and 13 percent in 2007 (Agüero and Barreto 2012). Girls living in rural areas face substantial challenges in economic and social development compared to their urban counterparts. Poverty in rural areas has been registered at more than 55 percent. Almost 50 percent of this population accesses unimproved sanitation, while 30 percent has access to an unimproved drinking water source (CIA 2016).

Rural women aged 15–19 had a higher rate of childbearing than their urban counterparts. The national rate for childbearing for women in that age group was 14 percent in 2007; for rural women, the rate was 20 percent, while in urban areas, it was 11 percent (Population Reference Bureau 2013).

Rural women often leave home for urban centers to work. For some women, their obligation stems from their families' financial need. Others might flee their homes to escape domestic abuse. However, their employment opportunities are limited once they reach the city. Women are employed as maids or servants in family homes, where responsibilities include cooking, washing, food shopping, and tending to younger children. Indigenous women who are employed as domestic servants are referred to as *cholas*, a derogatory term (Sloan 2011, 105).

Indigenous children suffer from limited access to schooling. In 2000, test scores among Peruvian children showed that Quechua children scored substantially lower than nonindigenous. Quechua girls scored lower than 20 on national tests, and nonindigenous girls scored higher than 25 (Lewis and Lockheed 2007, 7). Furthermore, it is estimated that 65 percent of indigenous girls and women

are illiterate, as opposed to 26 percent of nonindigenous girls and women (Cevallos 2002).

Education

Since 2008, the government has steadily increased its national expenditure on education. In 2008, the government spent 2.88 percent of its gross domestic product (GDP) on education, and in 2014, it spent 3.66 percent. The Ministry of Education oversees all educational institutions in the country. In 2010, the average number of years of schooling for Peru's female population age 25 years and above was 8 years, slightly lower than the average for all Latin America and Caribbean nations at 8.1. Males in the same age group average 9.3 years of schooling (UNESCO Institute for Statistics 2014).

Peru prides itself on providing universal primary education. In 1928, the first public high school for girls opened, and since 1996, Peru has supported free, compulsory education to all youth ages 5–16. The academic year runs from March through November or December.

Although primary school is free and compulsory, Peru struggles with maintaining a strong enrollment among school-aged children. In 2012, the out-of-school student population peaked with 238,095 unenrolled children. That number has since decreased. Most recently, in 2014, there were 161,695 children out of school, and 72,356 were female. Although more girls than boys attend school in the early years, access to secondary education is a growing challenge for girls across the country. The transition rate from primary to secondary education in 2013 for females was 93.74 percent, compared to 95.17 percent for males, a significant drop from the previous year when 98.31 percent of females and 99.94 percent of males transitioned from primary to secondary education (UNESCO Institute for Statistics 2014).

In 2007, the illiteracy rate was 7.1 percent, dramatically reduced from 12.8 percent in 1992. In rural areas, illiteracy is markedly higher, 19.7 percent, compared to urban areas, where the rate is 3.7 percent. At 10.6 percent, women have a higher illiteracy rate than men at 3.6 percent (PAHO 2013). However, among 15- to 24-year-olds, the literacy rate is about the same—99 percent for women and 98.9 percent for men (ECLAC 2015b).

The average number of years of education is lower in rural than in urban areas, 6.4 versus 10.9 years, respectively (PAHO 2013). For girls living in rural areas, access to education is more challenging. Families often live far from towns where schools are located. Without transportation,

girls are forced to walk long distances, in some places as much as an hour, to get to school (Salazar 2011). Not surprisingly, many girls drop out. The female out-of-school population was approximately 49 percent in 2010 (UNESCO Institute for Statistics 2014). A study completed in 2009 revealed that only 43 percent of young rural women between the ages of 20 and 24 had finished secondary school, compared to 58 percent of young men in the same age range (Salazar 2011).

Cultural factors also play a role in limiting female education. Rural families often encourage girls to take jobs that are more productive and can contribute to the family's finances rather than attend school. However, recent research found that families are beginning to change their perspective on the value of education. One report that focused on young women in rural Peru stated that mothers and girls see education as a "source of progress" and "gives them the opportunity to become someone in their lives" (Agüero and Barreto 2012).

Universities

Peru has 78 universities that enroll approximately 500,000 students, a dramatic increase from the previous century. In 1900, only 1,000 students attended a higher education institution, and in 1962, only 7 universities were in operation (Karim 2011). Women were first allowed to receive a university education in 1908. In 1970, there were 34 universities, and by 1990, that number had increased by 51 (Karim 2011). Between 2005 and 2009, the percentage of women over 15 years of age with a university-level education increased from 8.7 percent to 12.1 percent, while among men it grew from 11.1 percent to 14.3 percent (UNESCO Institute for Statistics 2014). A 2015 law created the Superintendencia Nacional de Educación Superior Universitaria (SUNEDU, National Superintendency of University Higher Education), which is responsible for overseeing all the activities and programs of Peru's higher education institutions. The group reports to the Ministry of Education and is charged with improving institutions' standards. In 2010, women surpassed men in postsecondary education, 42.5 percent versus 38.59 percent, respectively (UNESCO Institute for Statistics 2014).

Technical Education

Students have the option of attending technical schools. Many technical vocational education and training programs are available to poor families in urban areas. The

ProJoven program provides access to three months of classroom training and internships and is aimed at teaching women the skills for traditionally male occupations, such as hotel and tourism services, IT support, logistics, warehouse management, industrial welding, food industry, and mechanics and automotive electrical systems. Trainees receive a stipend, with mothers receiving double the regular amount to support their participation. After 18 months, female participants were 15 percent more likely to be employed, and they generated 93 percent more labor income compared to nonparticipants with similar backgrounds (UN Women 2015). Educational programs such as ProJoven offer much-needed alternatives for girls who are unable to enroll in university programs.

Health

Peru has a decentralized health care system administered by five different entities. These include the Ministry of Health (MINSA), which provides health services for 60 percent of the population; EsSalud, which provides for 30 percent of the population; and the Armed Forces (FFAA), the National Police (PNP), and the private sector together provide services to the remaining 10 percent (WHO 2016a).

In 2015, women's life expectancy was 75.6 years, higher than men's, which was 71.45 years. The government spent 5.3 percent of its GDP on health payments in 2013 (CIA 2015). That percentage has increased since 2005, when the government spent 4.5 percent of its GDP on health (PAHO 2013).

Access to Health Care

In 2002, the government established a Comprehensive Health Insurance program (SIS). It created a decentralized agency with an independent administration and financing. Its purpose is to protect uninsured Peruvians' health, making them a priority because they are the most vulnerable due to poverty (Cancer Control 2014).

In 2012, the physician's density was 1.13 physicians per 1,000 people (CIA 2016). Peruvians suffer from an unequal geographic distribution of health care workers. The majority is located in Lima and the coastal areas, and the rural areas of Piura, Lambayeque, and Loreto have the lowest densities of health care workers. In Piura, a rural area in the north with over 1 million inhabitants, the number of doctors in 2009 was 594, less than 4 percent of Peru's total population of doctors (Ministerio de Salud 2011).

Out-of-pocket payments (OPPs) for women's health care adds to the inequity apparent in Peruvian society. Compared to men's health treatment, OPPs for women are systematically higher, which often prevents them from seeking medical attention. More than 90 percent of women in the lowest wealth quintile reported barriers such as limited finances, restrictions on mobility, or the need to obtain consent from family members. The distance to a health care facility is a major concern, particularly for women living in rural areas. In fact, 67 percent of women living in rural areas and 34 percent in urban areas reported distance to a health care facility as a difficulty to receiving health care (UN Women 2015). The lack of female medical doctors is also a deterrent to seeking health care.

Access to Family Planning

The Catholic Church plays a strong role in Peru's public policy, and in the mid-20th century, an intense debate started due to the church's opposition to birth control and the challenges of population growth. The 1985 Law of the National Population Council established guidelines guaranteeing couples the freedom to choose a birth control method for family planning. Abortion and voluntary sterilization were excluded under the law. The Peruvian Catholic Church vehemently opposed the law.

The National Ministry of Health oversees all family planning programs. The prevalence of contraceptives for women ages 15–49 has declined recently. In 2012, the percentage of women in that age group with access to contraception was 75.5 percent; this decreased to 74 percent in 2013 (World Bank 2016b). Abortion continues to be illegal, except when the woman's physical or mental health is at risk. Under the criminal code, a woman who causes her own abortion or consents to an abortion can be punished by up to two years' imprisonment or be required to complete community service for 52–104 days. Abortions must be performed by a physician, with the pregnant woman's consent and after consultation with two physicians.

Indigenous women have faced additional challenges with respect to their reproductive freedom. Feminist lawyers and women's rights organizations uncovered mass sterilization campaigns that systematically targeted indigenous women in poor rural communities as part of a broader family planning program under Fujimori's presidency (1990–2000) (UN Women 2015). Although the program was intended to show a commitment to reproductive health care, women's reproductive rights, and the

promotion of gender equity, 217,446 indigenous women were sterilized from 1996 to 1998, many without voluntary consent and often in poor conditions (Ewig 2006, 633–634). These findings prompted an investigation by the national human rights commission that eventually led to national reform (UN Women 2015).

Maternal Health

Peru's estimated overall fertility rate as of 2015 was 2.18 children per woman (CIA 2015). The rate has been declining from 2.9 in 2000 to 2.5 in 2010. However, in rural areas, the rate was higher at 3.5. As of 2013, one-quarter of the country's population were women of childbearing age (15–49 years old), and women younger than 30 years old made up 48.1 percent of the population. At 3.6 and 4.0 children per woman, uneducated and poorer women had higher fertility rates. In 2010, 13.5 percent of all adolescents had been pregnant at least once. From 2000 to 2010, Peru experienced a higher fertility rate among adolescent women, ages 15–19 years old. The rate increased from 66 to 68 births per 1,000 women. For women in urban areas, the rate was 54 per 1,000, while for women in rural areas, it was substantially higher at 110 per 1,000 (PAHO 2013).

To encourage women to obtain health care assistance during pregnancy and for their young, the government instituted a cash transfer system for low-income and economically disadvantaged women. The program offers cash assistance to expectant mothers and those with young children to help pay for medical assistance. However, women still face challenges, such as distant health facilities, long waiting times, and mistreatment by staff (UN Women 2015). As a result, some women do not seek out maternal health services, even when conditions support their use.

Since 1990, the maternal mortality ratio for women ages 15–49 has been declining. In 1990, the ratio was 251 deaths per 100,000 births in the country. In 2015, the ratio decreased to 68, with 420 maternal deaths, a dramatic drop from 1990 when the number of deaths was 1,700. The country's annual rate of reduction from 1990 to 2015 was 5.2 (WHO 2016b).

Diseases and Disorders

Both women and men suffer from acute respiratory infections from influenza and pneumonia, and in 2014, it was the leading cause of death for both sexes. Over 16 percent of female deaths and over 21 percent of male deaths were caused by such infections (Ministerio de Salud 2014).

Cancer is a growing health concern. In 2000, 1,187 females died from breast cancer. That number grew to 1,261 in 2007 (WHO 2013). Between 2000 and 2011, because of early detection and improved diagnostics, the National Institute of Neoplastic Diseases (INEN) Hospital Registry reported 109,251 new cases of cancer in the country. According to the group, cervical cancer, at 16 percent, was the most frequent type reported, followed by breast, 12.1 percent; stomach, 8.1 percent; leukemia, 5.6 percent; prostate, 4.6 percent; melanoma, 4.4 percent; lung, 4.2 percent; colorectal, 4.1 percent; lymphoma, 3.6 percent; and thyroid, 3.1 percent. Females accounted for 63 percent of the new cases, while 37 percent were male (Cancer Control 2014). Cancer diagnosis and treatment had been primarily centralized in Lima, creating unequal access across the country. In 2012, the government started Plan Esperanza (Plan for Hope), which focused its efforts on promoting early detection, health care, and decentralizing cancer treatment facilities in the country.

HIV/AIDS

HIV cases are most frequently reported among men who have sex with men and transgender women. In 2014, approximately 72,000 people were living with HIV. Of these, about 21,000 were women aged 15 and older (UNAIDS 2014b). In 2012, pregnant women aged 15–24 accounted for approximately 0.23 percent of the national total (PAHO 2013). In 2016, there were an estimated 2,200 deaths due to HIV/AIDS (CIA 2016). The majority of reported cases occurred in Lima. Between 1983 and 2014, among women who contracted HIV, 1,382 were between the ages of 25 and 29, the highest concentration of cases (UNAIDS 2014a).

Individuals infected with AIDS often face discrimination and harassment in areas such as employment and housing. HIV-positive Peruvians have also reported discrimination when seeking assistance at state health agencies as well as in public areas. To address this, in 2008, Peru passed a ministerial resolution to prevent discrimination of HIV-positive employees in the workplace, but there continues to be a lack of education and prevention programs in the country.

Employment

By law, women cannot be discriminated against in the workplace and are entitled to equal pay for equal work. The

government has passed minimum-wage legislation for all workers regardless of the employment sector or worker status. This legislation included informal workers, leading to an increase of 7 percent in their earnings. Women also have the right to receive 13 weeks of paid maternity leave and earn 100 percent of their wages during their leave (UN Women 2015).

Female participation in employment has increased dramatically. In 1990, female employment was 46 percent; this grew to 68.2 percent in 2013 (UN Women 2015). In 2014, it increased slightly to 69 percent, but it remained lower than male participation at 87 percent (World Economic Forum 2014). Despite the growth of women's participation in the labor force, unemployment among women has grown from 2011, 4.3 percent in 2012 to 7.6 percent in 2016 (World Bank 2016c).

The majority of women are employed in the service sector, approximately 60 percent, followed by agriculture and industry (CEPAL 2007). In rural areas, women who live in extreme poverty primarily work in agriculture. A 2012 report showed that, in 2010, 89 percent of women aged 26–35 who lived on USD\$2 per day were agricultural workers working the fields. Sixty-one percent of women aged 18–25 and 56 percent of women aged 26–35 were employed as field laborers. Although women work as agricultural laborers at a higher rate than men, they face challenges when it comes to obtaining an agricultural position with more responsibility. Among male agricultural workers aged 26–35, 42 percent are employed as land overseers or cultivators. Among men aged 18–25, 9 percent had that responsibility. For female agricultural workers, only 7 percent of those aged 26–35 are hired as land overseers, and for ages 18–25, only 2 percent were female (Agüero and Barreto 2012).

For rural women, access to landownership is a concern because owning land is essential to their economic development. Traditionally, land allotment has been based on patriarchal values, thus excluding women. Furthermore, landowners had to have legal identification, thus preventing rural women from asserting their rights to ownership, as many are illiterate and lack proper documentation.

Water transfer agribusiness (WATA) has developed in Peru's arid coastal region, such as Arequipa. The government touted large-scale irrigation projects as a way to improve food scarcity among the poor and to contribute to the area's economic development. However, women were completely ignored throughout the

process. The design and implementation of these projects were geared toward “modern” farmers, excluding female growers because they were perceived as being too traditional and unwilling to adapt to the proposed agricultural changes. Because land reform did not include women as beneficiaries, they were excluded from negotiations with the government. However, women led protest marches in their communities opposing the projects, making them victims to military repression. (Vera Delgado 2015).

Peru’s mining industry is another employment sector where women have confronted immense challenges, whether as artisanal miners or as part of large-scale operations. Artisanal miners use rudimentary techniques to extract minerals, and their work is not regulated by the government and can be dangerous for the employees. In Latin America, approximately 10–20 percent of artisanal miners are female (Hinton, Veiga, and Beinhoff 2003, 2). These women often face physical abuse and violence in their employment. Because of the lack of government oversight, they often have no legal recourse to help them communicate grievances. There have been reports of abuse at the hands of police officers in mining areas.

Women have achieved success in uniting and creating cooperatives to improve working conditions in the mines. For example, in the La Rinconada and Cerro Lunar mining settlements, approximately 800 women belong to a cooperative that reworks tailings to mine gold (16). Women have also been active in opposing large-scale mining developments in rural Peru. The Asociación de Mujeres Protectoras de los Páramos (AMUPPA, Association of Women Protectors of the Highlands) in Huancabamba, Northern Peru, resisted the Rio Blanco copper project. Activists raised concerns that the mine would negatively impact the cloud forests in the region that the local population relies on for watering their crops. They also feared the mine would be detrimental to the fragile biodiversity of the region.

Throughout the country, women have become more integrated in local economies as street vendors. These women sell items such as homemade goods or candy as part of the informal economy. Estimates indicate that as many as 60 percent of women participate in the informal economy, which has limited health benefits (Asencios 2009). Some women have joined or created cooperatives where they develop much-needed business skills, such as market knowledge and product development, to help improve their economic success.

Family Life

The average size for a family in 2012 was 3.92 (Nakono 2016). Like other South American countries, children are often raised in families that include extended family members. In 2012, 45 percent of children under the age of 18 lived in a household with adults in addition to their parents (Institute for Family Studies 2015). Peruvian society has a strong history of maintaining traditional family roles. In fact, in 1957, the government passed legislation for public elementary and high schools to create courses designed to train girls to understand and meet their roles as wives, mothers, housewives, and citizens (Necochea 2014, 40). Many of today’s rural women continue to face expectations of having traditional roles.

Rural women tend to live with their partners rather than marry to save money, spending it on food, education for their children, or improving their home. Choosing to live with a partner rather than marry can be a traumatic change, as the woman often lives with her partner’s family, leaving hers behind, which puts a strain on the couple’s privacy and restricts their living space (Agüero and Barreto 2012).

Women traditionally care for older family members. Among urban families, 86 percent of caregivers are female, and among rural families that percentage increases to 89 (UN Women 2015). Caregivers are forced to reduce their paid employment hours to provide the needed care. Daughters, daughters-in-law, and spouses are the principal caregivers for dependents suffering from dementia.

Among young rural women, obligations to tend to family are substantially higher. Almost 60 percent of women ages 18–25 perform some type of family work to satisfy the needs of dependent adults or children in the house, such as cooking, cleaning, or child care (Agüero and Barreto 2012). These women are not paid for their work. In comparison, only 31 percent of males in the same age group perform such work. It is common for these women to prepare breakfast or wash clothes before going to school, and then in the afternoons, they take care of younger siblings. After marriage, these women often live with their spouse’s family, where they perform the same tasks and care for their in-laws.

LGBTQ Issues

The strong Catholic tradition and prevalent machismo, or masculine pride, has limited the activities of the LGBTQ community. A 2014 national poll showed that

73 percent of the national population opposes same-sex civil unions (Herrera 2015). According to the constitution, marriage is ambiguously defined, but the law endorsed by Congress states that “marriage may only be undertaken by one man and one woman” (De la Cruz 2013). Any change to the marriage definition is under the purview of Congress or the judiciary and is tied to securing political party support. The LGBTQ community has faced challenges in revising national policy, and the slow progress of accepting LGBT rights has delayed marriage-equality advocacy efforts. Despite this, Peruvian congressman Carlos Bruce, the first political figure to come out as homosexual, introduced a bill to recognize same-sex civil unions in 2013.

Most advocacy efforts for gay rights have occurred at the local level. In Lima, the leading LGBT rights organization, *Movimiento Homosexual de Lima* (MHOL), advocates for equality. Groups like MHOL have focused their efforts on discrimination and violence against members of the LGBTQ community. The lack of data collection by government agencies regarding discrimination or violence against the LGBTQ community makes it difficult to make analyses about the magnitude of these issues. Furthermore, Peru does not have a law that specifically prohibits discrimination against persons based on sexual orientation or gender identity. Local organizations, such as the *Centro de Promocion y Defensa de los Derechos Sexuales y Reproductivos* (Center for the Advancement and Defense of Sexual and Reproductive Rights), have relied on individual accounts and newspaper reports to document the struggles of LGBTQ Peruvians (PROMSEX 2013).

Politics

Peru is divided into 25 political regions and the province of Lima (World Scholar 2011). Peruvian law requires a quota of 30 percent of women for each candidate list for local, regional, and national elections (Ames 2013, 268). The quota law has boosted female representation by 7 percent (Htun 2002). However, in the 2001, 2006, and 2011 congressional elections, female representation did not meet the target quota. In 2006, only 36 legislators were women, and in 2011, this decreased to 28 (CLADEM 2016).

Women won the right to vote in 1955. However, only women who were at least 21 and literate and women over 18 and married were allowed to vote. Peru's high rate of illiteracy among women disqualified many from voting

in elections. It was not until the constitutional reforms of the late 20th century that all women secured equal rights (Zavaleta 2010).

Peru's government has several political parties and alliances, which include *Gana Peru* (Peru Wins), an alliance of the *Partido Nacionalista Peruano* (Peruvian Nationalist Party) and Communist PCP, the Socialist PS, the *Partido Socialista Revolucionario* (Socialist Revolutionary Party), and the *Movimiento Politico Voz Socialista* (Political Movement Socialist Voice); *Fuerza Popular Perú* (Popular Force Peru); *Peru Posible* (Possible Peru); and *Alianza por el Gran Cambio* (Alliance for Great Change).

Peruvian women have successfully won national elections. Irene Silva de Santolalla, the first female senator, was elected in 1956 to represent the state of Cajamarca. In 2011, Peru elected Marisol Espinoza Cruz as its first vice president. Espinoza Cruz first served as a congresswoman representing the Peruvian Nationalist Party. Overall, female political participation has fallen to just 27.4 percent from a high of 89 percent of women holding ministerial cabinet positions. Between 2006 and 2008, 29.2 percent of the legislators were female. In the 2015 elections, only 22.3 percent were female legislators (ECLAC 2015a).

Similarly, the number of women judges has recently declined. In 2013, women comprised 28.9 percent of the judges in the highest court. At the local government level, women have made advances in their political representation. The number of female mayors increased to 5.6 percent in 2014. Lima elected its first female mayor, Susanna Villaran, in 2010. She won the election as the nominee for the Social Force Decentralisation Party (FS), which was formed by the merger of the PDS and eight other center-left parties. Villaran's election was the first left-wing candidate to win the mayoral post in the capital since 1983. She secured the win with 38.4 percent of the vote, while her closest rival, Lourdes Flores, a candidate of the conservative Popular Christian Party (PPC), won 37.6 percent of the vote (Perry 2011). At the municipal level, the percentage of female city councillors increased from 27.4 percent in 2013 to 30.5 percent in 2014 (ECLAC 2015a).

Religious and Cultural Roles

Roman Catholicism is Peru's official state religion, and more than 80 percent of the population practice it (CIA 2016). After the Spanish conquest, the Catholic Church established a strong presence. Spanish friars, inspired by

their faith, worked to convert indigenous people while acquiring land and wealth and integrating itself with the ruling government. That relationship continues today. In Lima, the National Cathedral is symbolically located alongside the National Palace. In between these two buildings is the Archbishop's Palace of Lima, the headquarters for Peru's Catholic Church. However, many indigenous people practice their beliefs in concert with Catholicism. In some communities, local festivals coincide with harvests representing indigenous traditions of celebrating crops.

Issues

Violence

Violence against women is a serious concern. Estimates indicate that 4 out of 10 women in Lima have experienced some sort of violence (Espinoza 2012). Across the country, physical abuse by a spouse or partner against a woman is reported to be at almost 40 percent. Of these women, more than half are divorced, separated, or widowed, and 42.1 percent lack education (CLADEM 2016).

The Ministry of Women and Vulnerable Populations is a national agency charged with investigating crimes against women, including rape, domestic violence, and femicide, killing a woman who is an immediate relative, spouse, or partner. The government has a comprehensive legal framework in place to protect women from rape. According to the law, the penalty for rape, including spousal rape, is six to eight years in prison. During 2014, there were 1,920 reported cases of rape. Among nongovernmental organizations (NGOs) working in Peru, there are concerns that rapes often go unreported due to a women's fear of retribution or further violence by the attacker (U.S. Department of State 2015).

The law also prohibits domestic violence. Punishments range from one month to six years in prison. According to the Ministry of Women and Vulnerable Populations, 7 out of 10 women have suffered physical or emotional abuse (U.S. Department of State 2015). Unfortunately, the agency does not have records of men sentenced because of domestic violence. As with rape, many domestic violence incidents go unreported for fear of retaliation or because of the expense of filing a case.

Peru incorporated femicide into the criminal code. The penalty for an individual convicted of femicide is a minimum sentence of 15 years' imprisonment. The law mandates sentences of up to life in prison when the victim is a minor, pregnant, or disabled. On average, seven women die each month due to domestic violence (U.S. Department of

State 2015). The majority of victims are women between the ages of 18 and 35, where the perpetrator is a partner or ex-partner who is between the ages of 25 and 44 (CLADEM 2016).

Through the work of NGOs and the Ministry of Women and Vulnerable Populations, support for women who suffer from domestic violence has improved. The Women's Emergency Program involves the police, prosecutors, counselors, and local welfare agents to help victims of domestic violence. The program provides 216 service centers throughout the country, and the ministry created a toll-free hotline that receives approximately 25,000 calls per year. Through July 2014, the Women's Emergency Program responded to 24,879 cases of domestic and sexual violence, of which 21,808 cases represented violence against women (U.S. Department of State 2015).

Indigenous Rights

Peru signed the 2007 UN Declaration on the Rights of Indigenous Peoples that established universal minimum standards for the "survival, dignity, well-being and rights of the world's indigenous peoples" (UNHR 2016.). The declaration includes the right of indigenous peoples to access education, health, language, and other basic rights. It also prohibits discrimination against indigenous peoples. According to government data, there are 55 indigenous towns in Peru (Ministerio de Cultura 2016). Peru has the second-largest population of indigenous women, totaling about 3.2 million (Portalewska 2013). However, these populations are facing serious threats from illegal loggers and miners that are encroaching on remote indigenous communities in search of natural resources such as mahogany and oil. Contact with these communities can have disastrous results, as their inhabitants are isolated and not immune to Western diseases.

The conflict between the rebel group Sendero Luminoso and the Peruvian armed forces during the late 20th century spilled into armed conflicts in indigenous villages. The rebel group forced villagers out of their communities in an effort to foster a cultural revolution in Peru. Approximately 75 percent of the 70,000 victims who were killed or disappeared during the conflict were young, male, and indigenous (Barrios Suarez 2015, 7). The targeting of the indigenous population by the Sendero Luminoso devastated their villages.

However, indigenous communities are gaining opportunities to promote their interests in national politics. The

government increased the quota for representation of the indigenous population to at least 15 percent of candidates on electoral lists for regional and provincial elections in certain areas of the country. The reform also increased the indigenous quota to 18 regions from 13 (U.S. Department of State 2015). Even with the increased political representation, indigenous women continue to have higher rates of illiteracy, poverty, and unemployment. Furthermore, a disproportionately high number of indigenous women lack identity documents, limiting their ability to receive government services, including health and education; to own land; and to participate in elections.

Afro-Peruvians

The history of the Afro-Peruvian population has ancestral links to the 16th-century Pizarro regime, when Spaniards used black soldiers, *ladinos*, to conquer indigenous tribes. Following the establishment of the Spanish Empire, enslaved Africans were brought to work on plantations and in mines. They originated from various African countries, including Angola, Congo, and Mozambique. A high number of blacks, estimates as high as one-quarter of the population, remained in Lima, causing the city to be labeled the “black city” at one time.

Efforts to end slavery began in 1821 under the leadership of José de San Martín, but it was not completely abolished until 1854. Current estimates of the Afro-Peruvian population vary. Official sources indicate that they comprise 6–10 percent of the total population (Minority Rights Group International 2016). School attendance for Afro-Peruvian children and adolescents is lower, 4 percentage points in preschool and 8.5 percentage points in secondary school, than their counterparts in other groups, which includes white and mestizo (UNICEF 2016). In addition, Afro-Peruvians are often the victims of hate crimes and discrimination. National groups such as Asociación pro Derechos Humanos del Negro and LUNDU Centro de Estudios y Promoción Afroperuanos have organized to promote development and to encourage Afro-Peruvians to unite in fighting racism and demanding equal rights. These organizations stress the plight of Afro-Peruvian women, who are subjected to both the *machista* mentality of Peruvian society and discrimination based on their ethnicity.

Deforestation

Deforestation is a serious concern. Peruvian forests comprise approximately 278,000 square miles (72 million

hectares) of the country, making it the fourth-largest area of rain forest in the world. Since 2000, the government has taken steps to reduce deforestation. At that time, the deforestation rate was 250,000 hectares per year. In 2005, the rate had decreased to 150,000, and the government has committed to reaching zero in 2021 (*The Economist* 2010). The main causes for deforestation are the logging and mining industries as well as road development and petroleum drilling. These industries are very powerful, and corruption is common. Employees often fabricate documentation, and bribing officials is expected (Neuman and Zarate 2013).

Because many indigenous populations live in the rain forest, there has been heightened concern for their livelihoods if their habitat continues to be destroyed. Women such as Nery Zapata, representing CORPIAA (Regional Coordination of Indigenous People, AIDESEP in Atalaya), and Patricia Cachique from the Boca Apinihua community advocate for more women to receive training just as men do in forest management and to promote shared decision making between men and women about the forests.

Puerto Rico

Overview of Country

The island of Puerto Rico (Spanish for "rich port") is a territory of the United States located in the Caribbean Sea, southeast of Cuba, Haiti, and the Dominican Republic. Puerto Rico is an archipelago, or cluster of islands, composed of the main island itself, the island-municipality Vieques, and several smaller islands, such as Culebra, Mona, Desecheo, Caja de Muertos, and numerous islets. At 100 miles long and 35 miles wide, Puerto Rico is the smallest island of the Greater Antilles, a group of Caribbean islands that includes Cuba, the Dominican Republic, Haiti, and Jamaica (CIA 2017).

Puerto Rico is not an independent country; rather, it has been a "commonwealth" of the United States since 1952 (Puerto Rico Report 2017). The term *commonwealth* describes the political relationship between the United States and its overseas unincorporated territories. Latino/a studies scholars point out that the territory remains a U.S. colony and is often referred to as the oldest colony in the world (Monge 1999). A colony is a territory under the immediate control of another, dominant nation-state that is not the home territory. Therefore, Puerto Ricans are U.S. citizens by birth who have all the rights of other Americans, such as the vote. However, similar to other U.S. territories, those who live in Puerto Rico are not allowed a vote in U.S. elections. Prior to its status as a U.S. commonwealth, Puerto Rico had a long history of colonization by the Spanish before it was ceded to the United States in 1898 because of the Spanish-American War (Novas 2008).

The official languages of Puerto Rico are Spanish and English, and many Puerto Ricans learn both languages at home and in school (CIA 2017).

As of July 2015, an estimated 3,598,357 people reside in Puerto Rico. Almost as many Puerto Ricans live in the

mainland United States as on the island. Those Puerto Ricans living elsewhere comprise the *diaspora*, which refers to a scattering or dispersion of a people outside of their homeland. Life expectancy at birth is 75.96 years for the total population and 80.66 years for women. The median age of women on the island is currently estimated at 41 years. The death rate is 7.6 per 1,000 population (CIA 2017).

Puerto Ricans are the second-largest group of Latinos in the country. Their experience in the United States is markedly different from that of other Latino groups, such as Mexicans and Mexican Americans. Most prominently, Puerto Ricans are American citizens by virtue of the island commonwealth's association with the United States. As a result, migration between Puerto Rico and the United States has been constant. An additional estimated 2.7 million Puerto Ricans live in the U.S. mainland, mainly in the New York and northern New Jersey metropolitan area, where they are known as "Nuyoricans" or "Jerseyricans." There are Puerto Ricans throughout all the states, including Hawaii, where a large community was established in the 1940s and 1950s.

Major migration to the New York area occurred in the 1950s and 1960s as people looked for better occupational opportunities. Since the mid-1970s, there has also been a trend of reverse migration to the island. There are many more still who travel migration circuits—extensive travel that loops back and forth between the island and the U.S. mainland, sometimes residing in either location for extended periods of time. A recent loss of job opportunities led to increased out-migration as Puerto Ricans sought work off-island. As a result, a 2016 estimate of the island's net migration rate is -7.4 migrant(s) per 1,000 people (CIA 2017).

Applying U.S.-based racial categories on the island presents problems when attempting to understand the ethnoracial composition of the Puerto Rican people. Due to a long history of colonization, most Puerto Ricans understand themselves to be a multiracial people that includes indigenous, Spanish, and African heritages. While there is little institutional racial discrimination, as is characteristic of the United States, those who claim a Spanish or other European ancestry are esteemed among most elite members of Puerto Rican society (Hall 2000). Pointing to the presence of a color hierarchy, status was accorded to those who claimed a heritage related to light-skinned, European colonists. Indeed, Afro-Puerto Rican women have spoken out to bring attention to their experiences of colorism in a society that identifies as racially mixed. Therefore, the U.S. census numbers, which claim those identifying as white 75.8 percent, black/

African American 12.4 percent, mixed 3.3 percent, and other 8.5 percent (including American Indian, Alaskan Native, Native Hawaiian, Pacific Islander, and others) may tell us much about color hierarchy in Puerto Rican society and little of the historical origins of this Latino people (CIA 2017).

History

Indigenous peoples such as the Taíno lived on the island for centuries prior to European intrusion on the home they called Borikén. Archaeological evidence of the presence of native peoples has been traced back as far as 3000 to 2000 BCE. Multiple Amerindian tribes, including the Arawak peoples of South America, merged to form the Taíno culture, which flourished circa 1000 CE into the late 1400s. An estimated 30,000–50,000 Taíno lived throughout the greater Caribbean region prior to Columbus's second voyage in 1493 (Novas 2008). Once the area was claimed by Spain, the indigenous population was nearly exterminated over the 400 years of colonial rule (Novas 2008).

During the pre-Columbian period, women had more power and were highly respected (Jacobs and Collins 1992). Taíno women performed several important roles in society. In addition to mothering, cooking, and kincare, they tended to farms and harvested crops. Taíno women made goods, such as blankets and baskets, that were valuable to their community. They also carved petroglyphs, or rock engravings, which held deep significance for their people. Taíno women could also become tribal chiefs (Jacobs and Collins 1992). Another indicator of women's status in pre-Columbian society might be signified by the female deity, Atabey, the mother goddess and one of two supreme deities in Taíno religion (Rouse 1993). Additionally, pre-Colombian women are also believed to have had active sexual lives (Jacobs and Collins 1992).

When the Spanish enslaved the Taíno population, their numbers soon dwindled through disease, malnutrition, and massacre. The European colonists introduced African slave labor to the island in 1513, and soon the number of Africans on the island outnumbered the Spanish and native populations. This historical interaction changed the composition of the island's population over time as African, Spanish, and native peoples intermarried. Puerto Ricans mixed-race heritage is primarily composed of these three groups.

Most enslaved African women were forced to work in the fields when Spanish colonizers shifted their focus from gold to agriculture. However, according to a law passed in 1789, an

enslaved person could buy his or her freedom and become known as a freeman or a freewoman. One Afro–Puerto Rican freewoman, Celestina Cordero, gained notability for founding the first school for girls in San Juan in 1820. Slavery was finally abolished in Puerto Rico in 1873.

Women have long participated in the life and society of Puerto Rico. Though most scholarship on Puerto Rican women's history encompasses the decades since the 1950s, there are many celebrated women figures in Puerto Rican history that date back to the 19th-century struggle for independence.

Poet, author, and revolutionary Lola Rodríguez de Tió (1843–1924) wrote many works in her lifetime that were extremely influential in Latin American society. Her first, a patriotic song inspired by the call for Puerto Rican independence, became very popular among the Puerto Rican people but exposed her to scrutiny from Spanish authorities. Eventually, she and her family moved to Mayagüez, Puerto Rico, where she published her first book of poetry, and then fled to Venezuela. She returned to Puerto Rico but was exiled again, ultimately making her way to Cuba, where she met other Puerto Ricans who had been exiled and continued her revolutionary activities. She helped found the Cuban Academy of Arts and Letters and is attributed with suggesting that the Puerto Ricans should model their flag from the Cuban flag. In addition to the independence of Puerto Rico, Rodríguez de Tió was also committed to women's rights and the abolition of slavery.

Another famous historical Puerto Rican woman is Luisa Capetillo (1879–1922), who was a writer, worker's rights activist, and a feminist. Capetillo was a leading labor organizer and a feminist anarchist who linked women's oppression with the struggle for worker's rights. A prolific political writer, her 1911 essay "*Mi Opinión*" ("My Opinion") is credited as one of the first Caribbean feminist writings. There, she wrote, "It is ridiculous, stupid that a couple in love with each other cannot belong to each other physically because decrepit formulisms call it immoral." Capetillo was jailed for wearing pants in public—the first woman in Puerto Rico to do so. She bore three children outside of marriage and worked for labor and women's rights until her death.

Overview of Women's Lives

As a commonwealth of the United States, not all global measures are taken, such as the UN Development Programme's Gender Inequality Index (GII). Other comparisons reflecting women's and girl's lives can be made. Puerto

Rico overall enjoys high development, and this is reflected in women's low maternal mortality rate, ranking it 140th out of 184 countries (the United States ranks 136th) based on 2010 data (World Bank 2017a).

Girls and Teens

According to UN statistics, as of 2015, the literacy rate of female youth (aged 15–24 years) is 99 percent (UIS Data UNESCO Institute for Statistics 2017). The unemployment rate for adolescents and young adults is, like the rest of the island, quite high and has likely led to students extending their years of schooling in high school and college; thus, extending the island's rates overall. In 2012, the unemployment rate for female youth was 23.1 percent (CIA 2017). The adolescent birth rate on the island was 41 births per 1,000 population in 2015, its lowest rate on record (World Bank 2017a).

The government's policies are against comprehensive sex education; abstinence education is the rule. Studies of adolescents in public schools, however, have found that a good number are sexually active before the age of 15 and that most of them do not use contraceptives to prevent pregnancy or sexually transmitted diseases (Montesinos and Preciado 2004).

Education

Elementary and Secondary Education

Education is highly valued in Puerto Rico, which invests one-third of its annual budget accordingly. Schooling is compulsory and free for all residents between the ages of 6 and 16, and about half of adults are high school graduates. Puerto Rico has more than 1,530 public schools and more than 800 private schools. In public schools, all instruction takes place in Spanish, and English is taught from kindergarten to high school (SECG 2016).

Postsecondary Education

Puerto Rico has one of the highest college education rates in the world. There are 44 universities on the island, and bachelor's degrees are held by one-seventh of the population (SECG 2016). The major public institution of higher learning is the University of Puerto Rico, with its chief campus at Río Piedras.

Women's studies began as a project in 1986 by the University of Puerto Rico, Cayey campus. The Women's

Studies Project (PROM) celebrated its 25th anniversary on August 30, 2011, with a symposium event that recognized feminists, activists, scholars, and teachers with a series of panels and workshops.

Health

Access to Health Care

Puerto Ricans on the island do not enjoy the same benefits as people on the U.S. mainland. Puerto Rico enacted health reform in 2005, so the nearly 40 percent of the island's population who are indigent and impoverished are no longer provided care through government-owned hospitals and emergency centers, but through private health insurance contractors (Internations Puerto Rico n.d.).

An article published in *Science Daily* in June 2011 suggests that the quality of hospital care in U.S. territories, including Puerto Rico, is inferior to hospital care provided in the 50 states (Internations Puerto Rico n.d.). This disparity can be interpreted as a direct result of the funding inequalities between U.S. states and territories.

Maternal Health

The birth rate is 15.5 births per 1,000 population. The infant mortality rate is 9.9 deaths per 1,000 live births. The total fertility rate is 1.9 children born per woman.

Diseases and Disorders

In the United States, Puerto Rico has one of the highest HIV/AIDS rates, which greatly impacts the lives of women, who experience one of the highest death rates from HIV/AIDS. Twenty-seven percent of all new cases of HIV infection were among those aged 13–29 years (CDC 2016). Feminist activists and HIV-positive women, such as L'Orangelis Thomas Negrón, have worked to bring attention to HIV rates among adolescents on the island and the need for prevention education. Affiliated with Regional Reference of the Youth Positive Network of Latin America and the Hispanic Caribbean, Thomas Negrón works with young people and women so that people living with HIV can have a better quality of life and live free of stigma.

Employment

High levels of joblessness and poverty have been a continuing and defining characteristic of Puerto Rican society

since U.S. intervention on the island. In 2012, the labor force participation by women was 33.5 percent, compared to 50.8 percent of men (CIA 2017).

Puerto Rico's per capita income is about half of the U.S. mainland. The economy is largely based in manufacturing. The industrial sector is significantly larger than agriculture, which historically has employed many people. With an approximate 3.6 million tourists in 2008, Puerto Rico has focused on tourism as a way to support its economy. Finally, the state sector is another key pillar; it employs more than one-third of the active labor force (CIA 2017).

Family Life

Marriage and Divorce

The family is generally highly valued in Puerto Rican culture. Historians of Puerto Rico, such as Eileen Suarez Findlay (1999), have highlighted the ways that the island has had many uniquely Puerto Rican structures of marriage, family, and sexual life that differ from North American and Western regulations around gender roles, marriage, and divorce. Prior to U.S. colonization, many poor and working people were reluctant to enter into legally sanctioned marriage, which was also a religious union. Rather than marrying, many Puerto Ricans entered into consensual civil unions. Racial boundaries were not rigidly regulated by society or law, while antimiscegenation (interracial marriage) was a key aspect of the U.S. racial system. Large families were standard, and children outside of the formal marriage contract were not uncommon or stigmatized. For the upper classes, marriage was more common, and divorce was rare, even though extramarital relations were likely. Women were largely dependent on men for economic support and stability (Findlay 1999).

Puerto Rico was one of the earliest Latin American countries to institute divorce in 1902, at the behest of U.S. officials. While the United States believed this would make marriage more attractive, the requests for divorce were high, and women were the majority of divorce petitioners. As women entered the formal labor market in the first decades after U.S. rule, new conceptualizations of gender and sexuality emerged (Findlay 1999). Feminist and antiracist labor leaders in the Puerto Rican labor movement viewed marriage as women's subjugation. They advocated for sexual freedom, or the practice of "free love."

Today, the number of common-law partnerships has consistently increased during the last few decades, despite the fact that they are not recognized and consequently do

not have any of the entitlements of legally married couples. Additionally, children have the right to be supported by their parents until they are 21 years old. In matters of divorce, the custody of children is almost always awarded to the mother, but legal responsibility is shared. And regardless of which parent retains child custody, the other parent is obligated to provide economic support (Womens Law 2008).

The first same-sex couples began applying for marriage licenses on July 13, 2015, after same-sex marriage became legal in the United States and Governor Padilla signed an executive order requiring Puerto Rican government agencies to comply with the ruling within 15 days. Later, District Court Judge Juan Pérez-Giménez ruled that the Supreme Court's marriage equality decision did not apply to Puerto Rico as a territory. However, in April 2016, the federal appeals court affirmed that Puerto Rico's ban on same-sex marriage was unconstitutional (Denniston 2016).

Sexuality

Puerto Rican women were at the center of the first experiments in fertility and population control using state support under the U.S. jurisdiction, initially enacted on the island under the New Deal programs in the 1930s (Colón-Warren 1998). Due to opposition on moral grounds from the Catholic Church, and from proindependence sectors that denounced it as an imposition to appease economic and social crises, birth control was only ambivalently and covertly supported by the state in Puerto Rico by the 1940s. Programs were carried on through private organizations until the 1960s, when it also became an open U.S. policy. Particularly contentious was the dramatic increase in women's sterilization, including about a third of women in reproductive age groups by the 1960s and 45 percent of those of reproductive age in unions by 1995 (Briggs 2002).

Today, contraceptive use is widespread. It is estimated that 75 percent of Puerto Rican women have used contraceptives at least once (Davila 1990). Despite the purported influence of the Catholic Church, religious affiliation has no bearing on contraceptive use. Data show that Catholics use contraceptives as often as non-Catholics. Overall, birth control usage reflects the prevalent belief that birth control is the main responsibility of women (Davila 1990).

Members of the lesbian, gay, bisexual, transgender (LGBT) community have the same protections and rights as heterosexual individuals. Persisting opposition to LGBT rights is due to the strong influence of Catholicism as

well as socially conservative Protestantism, some argue. Public education about sexual and gender identity issues throughout the island has brought about both cultural and legal changes, as has the island's relationship to the U.S. legal system. On December 10, 2015, a Puerto Rican court approved the first adoption order for an LGBT couple, which had previously been prohibited by Puerto Rican law (LGBTQ Nation 2015).

Household Roles

Gender roles continue to change drastically on the island. As more women enter the workforce and pursue an education, the role of women as mothers that is marked as traditional has changed, as evidenced by the large number of Puerto Rican women who postpone marriage and childbearing until their late thirties (Colón-Warren 1998). Another indicator is that nonmarriage partnerships have increased in popularity among white-collar workers and educated Puerto Ricans.

Politics

Puerto Rico has been under U.S. sovereignty since 1898, when the Treaty of Paris ended the Spanish-American War. Since 1917, Puerto Ricans have officially been citizens of the United States, but they cannot vote in presidential elections and have no voting representation in either the Senate or the House of Representatives. Puerto Rico achieved commonwealth status in 1952, when the governor of Puerto Rico proclaimed the Constitution, which had been drafted by an elected convention and approved by Congress and the president of the United States. However, the old laws defining the political, economic, and fiscal relationship between Puerto Rico and the United States remained effective.

In June 2011, the UN Special Committee on Decolonization called on the United States to expedite a process that would "allow Puerto Ricans to fully exercise their inalienable right to self-determination and independence." As a result, a two-step plebiscite was set up, the first of which was held in November 2012. In the referendum, voters were asked whether they want to maintain the status quo (i.e., commonwealth status under the territorial clause of the U.S. Constitution). The three options given were statehood, independence, and free association. However, as of the beginning of 2013, unambiguous results and consequences remain to be seen. It is widely

assumed that a clarification of Puerto Rico's status will benefit the island's economy, as the current uncertainty is seen as an obstacle to economic development (Puerto Rico Report 2017).

Puerto Rican women gained suffrage in 1932, and women taking roles as political leaders can be observed toward the second half of the 20th century. The first woman mayor of San Juan, the capital of Puerto Rico, was Doña Felisa Rincón de Gautier (1897–1994), elected to office in 1946. Rincón de Gautier not only made history in Puerto Rico, but she was also the first woman to be elected as the mayor of a capital city in all of the Americas. Rincón de Gautier was also a proponent of women's rights and the vote. After 22 years as mayor, she also served as an American goodwill ambassador for four U.S. Presidents (Negrón Hernández 2016).

The major political parties are New Progressive, Popular Democratic, Puerto Rican Independence Party, and Independent. Today, a large number of women have entered Puerto Rican politics as mayors, senators, and representatives, shifting an almost exclusively men's arena toward gender equity. In 2000, a woman governor, Doña Sila María Calderón, was elected. In 2016, attorney Alexandra Lúgaro (1981–) became the first woman to run as an independent candidate for governor of Puerto Rico in its history. Lúgaro lost the four-way race to the New Progressive candidate, but she beat the other Independent candidate with twice the votes for a total win of 11.12 percent of the popular vote. Another sign of changing roles on the island, prior to her run for governor, Lúgaro gave birth to a daughter, Valentina, through in vitro fertilization (IVF) with an anonymous donor (El Nuevo Día Noticias 2015).

Religious and Cultural Roles

Religion

Spanish colonial influence on the island over four centuries, beginning in 1508, has left many cultural legacies in Puerto Rico, one of which is religious tradition. During those years, Roman Catholicism was spread throughout the population. Most Puerto Ricans today, as many as 70–90 percent of the island population, count themselves as Catholics, with 97 percent saying they believe in God. Once the U.S. presence arrived in Puerto Rico, Protestant Christianity also began to grow on the island, and all major sects are represented. Pentecostal fundamentalism has developed in recent decades, and there is

a small Jewish community on the island as well, which represents close to 10 percent, with the remainder following Islam or practicing Santería (Frommer's Media LLC 2017).

Practiced in much of the Hispanophone Caribbean, Santería is a syncretic religion that developed among the region's West African descendants that blends with the practices and beliefs of Catholicism. In Puerto Rico, Santería developed from *espiritismo* (spiritualism) circa the 1950s (Santería Church of the Orishas 2016). Followers of Santería worship Yoruban gods and goddesses alongside Catholic saints. Many of the saints in the Catholic faith have their counterpart *santos* among Yoruban deities. Puerto Rican migrants also bring Santería traditions to the U.S. mainland, where we see the religion practiced in centers of the Puerto Rican and Caribbean diaspora, such as in Miami and New York.

In contrast to the Catholic Church, where women's roles in religious leadership are quite limited, in Santería, women are initiated into the priesthood as *santeras*, or priestesses. As Santería is rich in symbolism and ceremony, practitioners are expert herbalists who use flowers and herbs in their rituals and burnt offerings. Practitioners patronize the island's *botanicas*, stores that sell roots, herbs, candles, soaps, and amulets, which are employed to sway the spirits to help individuals achieve success. These *botanicas*, which are so important to the religious practice, are typically owned by priestesses. Santería followers also emphasize how women saved the religion from extinction during the persecution of the faith under colonial rule (Santería Church of the Orishas 2016).

Culture

The culture of Puerto Rican life has been significantly shaped by its history. It was originally inhabited by a society of peaceful, agriculturally based indigenous people who migrated to the island from South America. Puerto Rico's population is ethnically mixed because of centuries of immigration and cultural assimilation.

Puerto Ricans have worked to preserve their Latin American and Caribbean heritage while welcoming U.S. economic and social innovations. The idealized folk hero of Puerto Rico is the *jíbaro*, a rustic, independent hill farmer, whose status in local song and story is similar to that of the gaucho of Argentina. However, modern Puerto Rican cultural life is a blend of North American, Latin, Caribbean, and African forms, as is evident in much of

the island's dance, music, art, literature, and sports. The typical dances of Puerto Rico, such as the *bomba* and the *plena*, are rooted in Africa. African influences are also found in food, music, and art. Music festivals, museums in Ponce and San Juan, and theatrical performances encourage *hispanidad*, or Spanish customs.

African women contributed to the development of Puerto Rican cuisine's potpourri of flavors. *Pasteles*, small bundles of meat stuffed into dough made of grated green banana (sometimes combined with pumpkin, potatoes, plantains, or yautía) and wrapped in plantain leaves, were devised by African women on the island and based on food products that originated in Africa.

Arts and Letters

Puerto Rican women have a long and robust history of contribution to the letters. Julia de Burgos (1914–1953) is the best-known female poet in Puerto Rico and one of the most famous Puerto Rican poets in Latin America. De Burgos graduated from the University of Puerto Rico; studied in Havana, Cuba; and later moved to New York. She published several books of poetry and over 200 poems, winning many honors before and after her death. A fierce voice for Puerto Rican independence, Afro-Caribbean writers, women's rights, and social justice, her legacy is powerful on the island and beyond. Organizations in Puerto Rico and the U.S. mainland bear her name, such as the Julia De Burgos Cultural Arts Center in Cleveland, Ohio, and the Julia de Burgos Latino Cultural Center, and seek to promote Latino heritage through the teaching and practice of the arts and letters. A park in Chicago and schools from Philadelphia to San Juan are also named after her.

Leading 20th-century and contemporary women authors include novelist Rosario Ferré (1938–2016), author of *Eccentric Neighborhoods* and *The House on the Lagoon*, which was a finalist for the National Book Award in 1995. She earned a master's degree in literature from the University of Puerto Rico and a PhD from the University of Maryland. Ferré wrote about Puerto Rican intergenerational identity and history, often through a feminist perspective. Ferré was also an essayist, children's book author, editor of a literary magazine, and a newspaper columnist and critic during her career.

Esmeralda Santiago (1948–) describes her life as in between cultures in her memoirs *When I Was Puerto Rican*, *Almost a Woman*, and *The Turkish Lover*. Santiago was born in San Juan, the eldest in a family that included

11 children, and moved to New York in 1961, when she was 13 years old, which strongly informed her writing. She writes of her humble beginnings, the poverty her family experienced, and how she went on to attend New York City's Performing Arts High School. She graduated from Harvard University and holds an MFA from Sarah Lawrence College.

Issues

Reproductive Justice

Historically, Puerto Rico has had the highest female sterilization rate in the world; one-third of Puerto Rican women living on the island have been sterilized, a consequence of a U.S. government policy to curb population growth (particularly among the poor) and ensure a cheap labor pool of women workers. Legislation cut the amount of federal assistance a woman would receive if she did not stop having children. Many women were sterilized without their knowledge while undergoing an operation. Others were given few options for contraception other than sterilization. The sterilization procedure was so common it became known colloquially as *La Operacion* (the operation) (García 1982). Today, feminist organizations such as the National Latina Institute for Reproductive Health fight for access to quality reproductive health and preventive services for all Latinas. Activists seek to empower Latinas and eliminate the major health inequities and poorer health outcomes that they experience.

Gendered Violence

Puerto Rico suffers one of the world's worst rates of intimate-partner violence. An international survey in 2006 that compared women's lives on the island to other nations concluded that a Puerto Rican woman is more likely to be killed by an intimate partner than women in 35 of the countries surveyed. In 1989, Puerto Rico adopted one of the first and most progressive laws against domestic violence in Latin America and the Caribbean. It provides civil protective orders for victims and criminalizes physical and emotional violence perpetrated by partners or ex-partners, legally married or not. It also eliminates the right of a married man to nonconsensual sexual intercourse with his wife or partner. However, women's advocates, such as the Movimiento Amplio de Mujeres de Puerto Rico (MAMPR, General Organization of Women of Puerto Rico), have denounced the government for

not doing more to confront this issue. The Caguas-based Proyecto Matria, an advocacy group for survivors of domestic and sexual violence, argues that the economic, social, and political crises on the island; inaction on the part of the government; and an increasing fundamentalist movement have worsened the situation for women.

As for domestic violence, activists have visited the offices of female legislators and heads of agencies and have reviewed the absence of gender perspective in legislation and public policies. Casa de la Bondad, a shelter that serves the Eastern region of the island, stated that the need for services is not decreasing, and all of the shelters on the island are usually full. Casa de la Bondad is one of the groups fighting to offer shelter, counseling, legal advocacy, supportive housing, and collateral services to women survivors of domestic violence and their children.

LGBTQ Equality

The history of gay and lesbian civil rights movements in Puerto Rico stretches more than 40 years. The Comunidad de Orgullo Gay (Gay Pride Community) was founded in 1973 and operated for a short time; since then, other organizations have been established. In 1991, the Coalición Puertorriquena de Lesbianas y Homosexuales (Puertorican Coalition of Lesbians and Homosexuals) created a bimonthly magazine dealing specifically with issues of discrimination and encouraging support among the LGBTQ community. And organizations such as Puerto Rico para Tod@s (Puerto Rico for All), an advocacy group for lesbian, gay, bisexual, and transgendered people, has partnered with other women's advocacy groups on issues such as intimate-partner violence.

HIV/AIDS/SIDA

There is an HIV/AIDS crisis on the island, and Puerto Rico has some of the most concerning HIV/AIDS statistics in the United States. In 2010, the rate of HIV infection diagnosis was 33.8 (4th in the United States), compared with the United States' total rate of HIV infection of 19.7. Additionally, Puerto Rico has an HIV death rate higher than any U.S. state or territory and nearly 4 times the national rate (AIDS United 2015).

The epidemic of HIV/AIDS/SIDA has propelled this issue to the forefront, establishing groups in different parts of the island to specifically serve HIV-positive individuals. AIDS United's funding collaborative with the Elton John AIDS Foundation, the H. van Ameringen Foundation,

Johnson & Johnson, and the MAC AIDS Fund is designed to build the capacity of community-based organizations on the island to most effectively combat the epidemic. The funds from this collaborative have supported the prevention work of six organizations to reach the islands most impacted populations, including young gay and bisexual men, young people, and substance users (AIDS United 2015).

Women's Poverty

Puerto Rico is poorer than the poorest state of the United States, with 45 percent of its population living below the poverty line. In 2014, the U.S. Census estimated that 58 percent of Puerto Rico's children live below the federal poverty level, which is much higher than the overall rate of 22 percent of children living below the poverty line throughout the U.S. mainland. Many children live in single-parent households, with women heads of household, and many of these are in high-poverty areas.

It is argued that women's employment has resulted in many advances in gender equality, and women's education and employment have been an important means of reducing family poverty. Yet, continuing joblessness on the island places even those with higher levels of education on the verge of economic precariousness. While the relationship between Puerto Rico and the United States has historically left the island impoverished, new factors related to today's global economy are exacerbating the issues. Women in Puerto Rico face the fallout of the debt crisis, high unemployment rates (10% as of 2016), and inconsistent access to wages (World Bank 2017b).

R

The Republic of Trinidad and Tobago

Overview of Country

The Republic of Trinidad and Tobago (T&T, or Trinidad and Tobago) consists of several small landforms and the two main islands. At 1,980 square miles (5,128 sq. km), the islands are slightly smaller than the state of Delaware (CIA 2016). The twin-island country shares maritime borders with Barbados to the northeast, Grenada to the northwest, Guyana to the southeast, and Venezuela to the south and west. Although located geographically in South America, T&T is often regarded as part of North America and typically considered part of the Caribbean because it shares language and cultural links with the rest of the English-speaking Caribbean.

Originally inhabited by the Caribs and Arawaks, most of whom died from diseases introduced to the country by colonizers, Trinidad was first colonized by Spain in 1498 and later Great Britain, which brought enslaved Africans to work on the island's sugar and cocoa plantations in the early 19th century. Following the abolition of slavery in 1838, there was an influx of indentured laborers and merchants from India, China, the Middle East, the Mediterranean Islands, Portugal, Italy, Madeira, and Ireland. Ruled by the Spanish, French, Dutch, Latvians, Germans, Danes, and the British, Tobago, the smaller of the two islands, "changed hands more often than any other Caribbean

island" during the colonial period (Youngblood Coleman 2014, 7). Trinidad and Tobago were incorporated into a single crown colony in 1888. On August 31, 1962, the country gained its independence from Great Britain, and in 1976, it severed its links with the British monarchy and became a republic within the Commonwealth of Nations.

T&T's capital is Port of Spain, and English is its official language. As of 2015, T&T has a population of 1,222,363 people. Between 2000 and 2011, the population of Tobago grew by 12.55 percent, making it one of the fastest-growing areas of the country. The majority of T&T's population is between the ages of 25 and 54 (46.5%), followed by individuals under the age of 14 (19.4%), those aged 15–24 (12.5%), those aged 55–64 (11.5%), and then those aged 65 or older (9.8%). Until the age of 54, men outnumber women; however, over the age of 55, women outnumber men, with the starkest contrast coming after the age of 65. The average life expectancy is 72.59 years, with men averaging 69.69 years and women 75.56 years (CIA 2016).

Sometimes affectionately referred to as "rainbow island" or "rainbow country," the "nation of ethnic minorities" takes pride in its ethnic, religious, and cultural diversity. Once 40 percent each, Indians and Africans comprise the country's two largest ethnic groups at 35.4 percent and 34.2 percent, respectively. Individuals self-identifying as mixed represented 22.8 percent, of these 7.7 percent have both Indian and African heritage, and 15.1 percent are mixed though not of Indian/African descent. Census

takers declining to state an ethnicity accounted for 6.2 percent, and individuals of European, Chinese, and Middle Eastern descent comprise the remaining 1.4 percent of the respondents. Whereas Trinidad is ethnically heterogeneous, Tobago's population is rather homogenous: Africans (85.2%), mixed (8.5%), and Indians (2.54%) (Caribbean Communication Network 2013).

The Roman Catholic, Hindu, Anglican, and some Muslim faiths represent the country's largest religious denominations. Islam, Baptist, Jehovah's Witness, and Seventh-day Adventist as well as Pentecostal, Evangelical, and Full Gospel denominations were registering growth, with the latter group experiencing a 108.4 percent increase in membership. The 2011 census data also revealed a decline in the number of individuals declaring any religious affiliation, with 146,798 persons not stating their religion and 28,842 declaring no religion (Caribbean Communication Network 2013).

Overview of Women's Lives

The country seems poised for continued radical change in regard to issues of gender equality and human rights. T&T's Gender Inequality Index (GII) ranking rose from 73rd in 2014 to 64th, out of 188, in 2105, placing it in the high human development category (UNDP 2015b). Women in T&T are making strides in education and politics and challenging assumptions about gender, sexuality, equality, and standards of beauty through their engagement in political, social, and grassroots activism. An active women's movement has put domestic and intimate partner violence, rape and sexual assault and sexual harassment on the public agenda.

Girls and Teens

Employment

The minimum age for employment is 16. However, children between the ages of 14 and 16 can work if the Ministry of Education approves the activity as vocational or technical in training or the work activities are for a family-owned business that only employs family members. Individuals under the age of 18 cannot work between the hours of 10:00 p.m. and 5:00 a.m. unless they are employed by a family-owned business. Youth ages 15–24 have an unemployment rate of 9.2 percent. Female youth experience a higher rate of unemployment (11.4%, 2013 estimate) than male youth (7.7%) (CIA 2016).

Sexual Assault and Statutory Rape

The age of consent is 16, although the law does not apply if the individuals are married. Rape, including spousal rape, is illegal and punishable by up to life in prison. An individual found guilty of having sex with a minor could face life imprisonment if the minor is under the age of 14, 12 years in jail for first-time offenders if the minor is between the ages of 14 and 16, and 15 years for subsequent offenses. Parents are required by law to report suspected cases of statutory rape. As happens with cases of sexual assault with adults, perpetrators often escape prosecution and usually receive lighter sentences when they are punished (U.S. Department of State 2013).

Consequently, teenage pregnancy is a significant area of concern because of the implications of statutory rape associated with it. Girls and young women are particularly vulnerable to physical and sexual abuse. The nation's adolescent birth rate per 1,000 births is 34.8. More than 2,500 teenage pregnancies are reported each year, and more than 1,000 women had four children by the age of 19 (UNDP 2015a).

Extracurricular Activities

Youth in T&T are highly likely to participate in extracurricular activities, with some youth participating in three or more activities, a rate that exceeds the participation levels of their American counterparts (Mello and Worrell 2008, 99). Whereas adolescent males participate in more athletic activities (football, hockey, basketball, netball, cricket, swimming, and table tennis) and organized activities (Scouts and Cadets), adolescent females participate in more artistic activities (dance, solo instrumental music, choir music, steelband music, drama and acting, and photography) and religious activities (religious clubs) (100).

Education

Education is compulsory and free for all children 5–12 years of age, and 98.8 percent of individuals over the age of 15 are literate. Some students begin their education as early as three years of age by attending a free Early Childhood Care and Education Centre. Upon the completion of primary school, students may continue on to secondary school, vocational studies, or craft training, or they may opt to end their formal education. Slightly over 72 percent of students 12–18 years of age continue on to secondary school. Students with satisfactory grades can choose to continue their

secondary studies for two additional years. The tertiary level, at which students can earn a bachelor's degree, is also free for Trinidadian and Tobagonian nationals attending public institutions. The average school life expectancy from primary to tertiary levels is 12 years. Women enjoy a slightly longer expectancy rate at 13 years than their male counterparts' average of 12 years (CIA 2016).

Health

At the present, the population growth rate of T&T is -0.083 percent. The birth rate per 1,000 people is 13.07, but the death rate per 1,000 people is 10.76 percent. The infant mortality rate is 24 deaths for every 1,000 births. In comparison to its peers in the World Health Organization (WHO) Americas Region, which includes Argentina, Canada, Colombia, Chile, Costa Rica, Ecuador, Mexico, Panama, Peru, and the United States, T&T leads its peers in the mortality rates for children under the age of 5, adults between the ages of 15 and 60, and women while pregnant or within 42 days of the termination of pregnancy. Per 1,000 live births, the under-5 mortality rate in the country for both sexes is 21, compared to the Americas Region average of 15. The maternal mortality rate per 1,000 live births is 0.84, compared to the Americas Region average of 0.68. The adult mortality rate, the probability of dying between the ages of 15 and 60, is 229 for men and 130 for women per 1,000 population, compared to 161 for men and 89 for women in the Americas Region (WHO 2015).

Twenty percent of male youths and 16.3 percent of female youths admit to using tobacco. Of male adults, 39.5 percent smoke, and 29.1 percent smoke daily. Of adult females, 9.4 percent smoke, and 7.7 percent smoke daily (WHO 2013). Although health warnings appear on cigarette packages and public places offer smoke-free spaces, as of 2011–2012, there were no national mass media campaigns warning about the dangers of tobacco.

The minimum legal drinking age in T&T is 18. While men are more likely to engage in heavy episodic drinking than women, the country's average recorded alcohol consumption, up since 2003–2005, remains lower than that of its WHO Americas Region peers (WHO 2014a).

Access to Health Care

The two-tiered health care system affords citizens the option of private and public health care facilities. Free and paid for by the government and taxpayers, public health

care consists of major hospitals and smaller regional centers and clinics. These facilities are used on a walk-in basis. T&T spends 59.4 percent of its gross domestic product (GDP) on industry (40% of which is spent on oil and gas production) and 40 percent on services (5.93% of which is spent on health care expenditures) (CIA 2016; World Bank 2015).

Maternal Health

T&T's maternal mortality rate belies their commitment to women's and children's health, a commitment embodied by policy adoption and service provision (Theodore 2012, 9). In 1990, T&T adopted and ratified the Millennium Development Goal of improving maternal health (9). Women can access prenatal health care for free from the public health system or for a fee from private care providers. For delivery, about 85 percent occur in public hospitals, 13 percent in private hospitals, and 2 percent at home or elsewhere (19). Antenatal care is free through over 100 care centers across the country (30). Despite the availability of care, some women are challenged in accessing it due to a lack of transportation or the understaffing of providers (29). One measure undertaken by the government to remedy this is a postgraduate program that registered nurses can take to become midwives (30).

Diseases and Disorders

Cardiovascular diseases (32%), cancers (16%), diabetes (14%), and chronic respiratory diseases (3%) account for 80 percent of total deaths (based on 13,000 deaths) (WHO 2014b). Between the ages of 30 and 70, the probability of dying from one of the four diseases is 26 percent. Injuries (11%) and communicable, maternal, perinatal, and nutritional conditions (9%) account for the remaining 20 percent of deaths. Men are more likely to die from noncommunicable diseases than women and experience elevated blood pressure (32.4%) more often than women (26.6%). However, more women (37.5%) suffer from obesity than men (20.6%). Breast cancer and prostate cancer are particularly fatal for women and men, respectively; 23 percent of cancer deaths for women were caused by breast cancer (more than cervical cancer (11%) and ovarian cancer (7%) combined), and 34 percent of cancer deaths for men were caused by prostate cancer (WHO 2014b). The high incidence of noncommunicable diseases could owe to several adult risk factors: tobacco smoking, alcohol consumption, elevated blood pressure, and obesity.

The rate of HIV per 100,000 population is 1,070, more than three times as high as the WHO Americas Region rate of 315 and twice as high as the global rate of 511 (WHO 2014c). Interestingly, T&T's prevalence of tuberculosis (TB) (28) is lower than the WHO Americas Region's (40) and significantly lower than the global (140) rate. Given the associated risk factors of TB, HIV being a major risk factor as well as cramped living spaces, tobacco use, substance abuse, overcrowding, diabetes mellitus, poor nutrition, and lack of health services, the low rate of prevalence of TB speaks well to the standard and quality of living in T&T.

Employment

Once an agrarian society, due in large part to its petroleum production, T&T is now one of the wealthiest countries in the Caribbean. The country reports one of the highest gross national incomes per capita, USD\$18,600, and is one of the fastest-growing economies in all the Caribbean, Central America, and South America (World Bank 2015). On average, women earned USD\$21,455 (TTD\$135,167), whereas men earned USD\$37,911 (TTD\$238,839) annually (Bagoo 2015).

Since the 1980s, women have made significant gains in terms of employment and careers, but there is more work to be done. Female participation in the labor market is 52.9 percent and 75.5 percent for males. Women now have access to fields previously dominated by men and have gained entry into white-collar occupations such as law, journalism, politics, and government posts. However, a gender divide in employment persists. Women are more likely to work in service-related professions—retail, salons, food service, sales, and light manufacturing—whereas their male counterparts are more inclined to be employed in agricultural, technical, and mechanical pursuits, particularly in the fishing, agriculture, and petroleum industries. Although women possess higher levels of educational attainment, they earn less than men on average, especially in private industry, where they are not afforded equal pay for equal work protections as they are in the government sector (Bagoo 2015).

Family Life

Marriage

T&T recognizes four types of marriage: civil (which is the most common form of marriage and includes all Christian marriages performed in churches), Hindu, Muslim, and

Orisa. The minimum age to marry legally is 18 for both girls and boys for civil and Christian marriage, 12 for girls and 16 for boys for Muslim marriage, 14 for girls and 18 for boys for Hindu marriage, and 16 for girls and 18 for boys for Orisa marriage (U.S. Department of State 2013).

The mean age of Trinidadians and Tobagonians at time of marriage is 27 years old. Even though some women are able to marry as early as ages 12 and 16, there is not a significant tendency to enter into unions at such a young age (SIGI 2014). Although the percentage of women in a consensual union was relatively the same across ethnic lines, East Indian women are more likely to be legally wed (54%) than to enter into common-law or visiting unions (14%). In comparison, 43 percent of African women enter into a common-law union, one in which the partners live together but are not legally wed, or a visiting union, in which the couple are in a relationship but are not legally wed and do not live together, and fewer are likely to legally wed (27%). However, it is worth noting that when African women marry, they often do so earlier than their counterparts or after having been in a common-law or visiting union for some time. The 2011 census data reveal several ongoing trends: the number of women who have never married or entered into a common-law union is almost equal to the number of married women sharing a household with their spouse, and women who have a secondary education are less likely to marry early than their peers with less education. Historically, the prevalence of common-law unions was higher among working-class and poor women. Women of a middle and higher socioeconomic level were more inclined to enter into formal marriage arrangements with religious sanction; however, in recent decades, common-law arrangements have become more common among women from middle and higher socioeconomic levels (St. Bernard 2003, 3).

Reproductive Health

In T&T, abortions are illegal except in instances where the woman's mental or physical health is in jeopardy. However, contraception, obstetrical care, and family planning are widely available from health care providers and online (U.S. Department of State 2013). As of 2012, T&T's total fertility rate was 1.8 children per woman, which is below the replacement level of 2.1. The mean age of first birth for women in 2010 was 27.66 years of age, with the peak of childbearing occurring between the ages of 20 and 29. As with the age of marriage, women's age at first birth

positively correlates to levels of educational attainment (St. Bernard 2003, 8). Therefore, the more education the mother has, the older she is likely to be at the time of first giving birth. Expectant mothers who are employed receive 13 weeks of paid maternity leave from their employers. They receive full pay for the first month and half pay for the remaining two months. Additionally, they receive a sum, depending upon their earnings and eligibility, from the national social security system (SIGI 2014).

The contraceptive prevalence rate, which refers to the percentage of women of reproductive age who use (or whose partner uses) a form of contraceptive, is 42.5 percent, lower than the WHO Americas Region average of 70.6 percent. Of women using some form of contraception, 37.5 percent use condoms (13%), oral contraceptives (10.9%), and female sterilization (8.4%), whereas 4.8 percent rely on withdrawal (1.8%) or the rhythm method (1.7%). Women in the country are informed of the various forms of contraception available; therefore, the discrepancy between knowledge and practice may be a result of the country's various religious influences and beliefs.

Family Structure and Roles and Responsibilities

The prevalence of female-headed households is high in the Caribbean, but it is lower in T&T. East Indian households tend to be patriarchal, and older men (and subsequently their sons) act as heads of household. African households, particularly those that are economically disadvantaged or working class, are more likely to be matrifocal and centered on the women and their children, even when male figures are present (St. Bernard 2003, 12). In this respect, Afro-Trinidadian women generally enjoy more power and autonomy within the household (17).

LGBTQ Rights

Homosexuality is a criminal offense punishable by up to 25 years' imprisonment. The "buggery" law is typically enforced when an individual is also being charged with or convicted of a more serious offense. Consequently, members of the LGBTQ community suffer a number of discriminatory practices: same-sex marriages are illegal, same-sex couples are not recognized nor can they adopt children, and members of the LGBTQ community are not protected by antidiscrimination laws in employment and the provision of goods. Members of the LGBTQ community are also not allowed to serve openly in the military,

to legally change their gender, or to enter into T&T if they are not citizens, although the latter has not been enforced.

In 2012, Prime Minister Persad-Bissessar was attributed with saying, "I do not support discrimination in any form against any individual, regardless of their gender identity and expression," pronouncing "stigmatisation of homosexuality . . . a matter which must be addressed on the grounds of human rights and dignity to which every individual is entitled under international law" (Baboolal 2012). Fearing the subject contentious and divisive, Persad-Bissessar declined to decriminalize same-sex activity, instead suggesting the country would need to vote on a referendum. Nonetheless, public opinion seems to be shifting as the LGBTQ community and its allies become more visible in society (Joseph 2014). The 2013 UNAIDS survey found that 56 percent of participants felt they were accepting or tolerant of homosexuals, 60 percent of young people and 62 percent of women believed they held positive attitudes about gay people, 78 percent thought gays should not be treated differently simply because of their sexual orientation, and 64 percent viewed violence against gays as being discriminatory.

Politics

Elections in T&T have been considered free and fair by international observers. The country's universal age of suffrage is 18. Women gained both the right to vote and to hold public office in 1946, and they are active participants in the electoral process but remain underrepresented in elected offices. Despite the failure of a bill in 2000 that sought to establish equal representation of men and women in Parliament, the number of women participating in politics increased between 2001 and 2009. As of November 2009, there were 11 women serving in the 28-member cabinet and 12 of the 37 judges on the High Court and the Court of Appeals were women (SIGI 2014.). As of December 2014, women held 12 of the 42 seats in the House of Representatives, representing 28.6 percent, and 6 of the 31 seats in the Senate, representing 19.4 percent (Women in National Parliaments 2014).

On May 26, 2010, Kamla Persad-Bissessar (1952–) became T&T's seventh prime minister and the first woman to hold the position. Persad-Bissessar began her career in politics at the local government level as an alderwoman and has participated at various levels of government, achieving along the way a number of firsts—the first woman attorney general, minister of legal Affairs, minister

of education, acting prime minister, leader of a political party (the United National Congress), and leader of the opposition. Her political platform includes addressing issues of gender equality and increasing women's political participation (Richards and IPS Correspondents 2010).

Problems that include domestic violence and discrimination persist and adversely affect women and members of the LGBTQ community. The 1999 Domestic Violence Act No. 27 and the Legal Aid and Advice Act both challenge ingrained societal beliefs that violence against women is a natural part of the culture. As recently as 2010, 19 percent of Trinidadians and Tobagonians believed domestic violence is "sometimes or always justifiable" (SIGI 2014). Additionally, the acts offer protections to victims of domestic and intimate partner violence, such as guaranteeing victims the right to an attorney and legal advice, access to a domestic violence hotline and shelters, and continued training in domestic violence intervention for police officers. The Equal Opportunity Act of 2000 and the Offenses against the Person (Amendment) (Harassment) Act of 2005 both offer protections against discrimination and harassment. Women cannot be discriminated against on the basis of gender in employment and hiring decisions, but no provisions exist to prohibit sexual harassment in the workplace. Even though the purpose of the two acts is to ensure equal treatment of all citizens, neither policy acknowledges sexual orientation and therefore excludes members of the LGBTQ community from legal protection against domestic violence.

Religious and Cultural Roles

Within Afro-Christian sects, women enjoy more influence and are central figures in the Orisa faith. However, within the Hindu and Islamic faiths, women are excluded from leadership positions. Although women are able to serve as swamis and yogis in the Hindu faith, they are prevented from performing priestly rites and rituals because of restrictions related to menstruation and the receipt of monetary compensation for the performance of religious services (Gopeesingh 2012, 9).

T&T is the birthplace of the steel drum and calypso (or "Kaiso") music. Traditionally the domain of men, women were discouraged from participating in calypso. Like their male counterparts, women's lyrics contain biting social commentary, with the women performers often stressing responsibility and protesting injustices such as domestic violence. Although their numbers have grown, women

calypsonians continue to be underrepresented within the genre because of the demands of home and family and the need for employment.

Women have always played a role in Carnival and actually outnumber men in the masquerade bands. Some critics find the provocative costumes and sexually suggestive dancing behaviors unbecoming women. More disturbing for some is that women's display of their sexuality and bodies are for their own enjoyment rather than that of their male counterparts. Yet, many of the women find playing *mas* (masquerade) to be personally, socially, and sexually liberating (de Freitas 1999, 28).

Issues

Standards of Beauty

Although T&T's population is multicultural, multiethnic, and diverse, some believe the country maintains a narrow and Eurocentric standard of beauty. In 2012, Athaliah Samuel was chosen to represent T&T in the Miss World Competition in China. Samuel's critics argued the dark-skinned Afro-Trinidadian was not a "traditional beauty" and labeled her "ugly" and "unfit." Supporters of the university graduate and model from Laventille, a predominately African Trinidadian working-class ward took to her defense, publishing a number of blog posts and articles accusing her detractors of colorism and classism.

The body size acceptance and health at every size movements in T&T also seek to resist and unlearn internalized beauty ideals by establishing more inclusive standards of beauty. Sheanna Allyne, CEO of the Caribbean Fashion Plus Week, asserts plus-sized women encounter difficulty purchasing figure-flattering clothes and finding stores and fashion designers that cater to them (Seebaran 2012).

Human Trafficking

The Trafficking Victims Protection Act (TVPA) upgraded T&T to the Tier 2 Watch List, which means the country has not fully complied with minimum standards but is making significant efforts to do so. Migrant workers and women from South America (notably Venezuela, Colombia, and Guyana) and the Dominican Republic are lured to T&T with the promise of employment, only to find themselves forced to work in the fishing industry, if they are men, and in brothels and clubs and sometimes coerced into marriage, if they are women. Transient children risk being forced to scavenge for trash and sell drugs.

T&T's Trafficking in Persons Act, enacted in 2011 but not proclaimed until 2013, established a Counter Trafficking Unit and protects victims from prosecution for crimes committed while being trafficked. Engaging in prostitution, owning a brothel, and pimping are illegal. The Children Act of 2012 criminalizes any attempt to subject a child to prostitution by carrying a sentence of 10 years to life. The country's failure to properly and fully enforce the legislation is a result of conflicts of interest and governmental complicity in human trafficking. In 2013, the arrest of 75 immigrant women, most from the Dominican Republic, on charges of prostitution revealed that the police did not provide the women with assistance, alert the antitrafficking unit, or screen the women for trafficking indicators. Instead, the women were detained until their court cases, and most were released on bail. Experts note that law enforcement officers, many of whom provide off-duty security for sex trade businesses, have a conflict of interest that might prevent them from fully investigating allegations of human trafficking.

Sexual Harassment

There are no laws in Trinidad and Tobago protecting women from sexual harassment in the home, workplace, or public domain. The prevailing belief has been that women should simply accept harassment as a part of the culture. In 2011, Simone Leid founded the WomenSpeak Project, an online platform using social media sites such as Facebook and Tumblr, to provide women with a forum to share their experiences with harassment. The WomenSpeak Project's goal is to help women process their thoughts and feelings regarding their encounters with harassment in all its forms and to bring about awareness that street harassment is a form of intimidation aimed to make the perpetrator feel empowered at the expense of the victim's sense of powerlessness. Women and members of the LGBTQ community affected by street harassment are encouraged to upload and share their stories, videos, and street harassment manifestos. On March 20, 2011, The WomenSpeak Project participated in the First International Anti-Street Harassment Day, which was expanded to a weeklong event in 2012 (Kearl 2011).

S

Suriname

Overview of Country

The Republic of Suriname, formerly called Netherlands Guiana or Dutch Guiana, is located on South America's northeast coast. It sits between Guyana to its west and French Guiana to the east, and it is bordered by the Atlantic Ocean to the north and Brazil to the south. Its landmass is 63,038 square miles (or 163,820 sq. km), making it the smallest country on the South American continent (CIA 2017). Suriname's abundant flora and fauna, along with its rain forest, are susceptible to environmental destruction and degradation due to commercial timber harvesting and extraction industries (IBP 2013). The population of 573,311 Surinamers primarily live in coastal villages that tend to be ethnically homogenous. They also live in urban areas, including Paramaribo, the largest city and capital, which is very multiethnic, and Nieuw Nickerie, which sits just across from Guyana (CIA 2017). Suriname has long been linked to Caribbean countries due to cultural and historical similarities, despite being situated on the South American continent.

Although the origin of the word *Suriname* is not clear, it is believed to come from the Surinen, one of the many indigenous tribes of the Amazon region. Within the Surinen, the largest tribes that lived along the coast—the Arawak and the Carib—were the first to encounter, resist, and, for some,

succumb to what became several waves of European explorers, settlers, and, ultimately, colonizers. Spaniards arrived in the 1500s, followed by the British in the mid-1600s. The Dutch claimed Suriname as a colony in 1667, after trading New York for Suriname to the British (Romero 2011). The Dutch brought enslaved Africans for harvesting sugarcane. They rebelled and attacked Paramaribo, but Paramaribo had been built to prevent such attacks. Through rebellion, Africans secured their freedom and set up their own villages inland, where they established peace treaties with the Dutch (Romero 2011). Slavery was abolished in 1863, but to replace formerly enslaved African labor, people from Indonesia and Java, primarily men, were brought to work as indentured laborers (CIA 2017; Hoeft 2014, 1).

In the 19th century, Western-educated and largely Dutch-speaking Surinamese began immigrating to the Netherlands. World War II interrupted the outflow in the 20th century, but immigration resumed after the war when Dutch labor demands grew. Emigrants included all segments of the Creole population (196).

Surinamers continued to retain strong linkages to the Netherlands because of job opportunities, family, and other ties. In the 1970s, Suriname's population dropped due to out-migration to the Netherlands "in anticipation of independence," which was granted in 1975 (Hoeft 2014, 3; CIA 2017).

In 1982, five years after independence, Suriname's civilian government was replaced by a military regime led by

Desire (Desi) Bouterse (1945–). Some considered his ruling style to be that of a dictator and cited as evidence his and his followers' involvement in what is now called the "December murders." Since then, Bouterse and 24 people have been suspected of executing 15 dissidents for not supporting the regime. The murders caused many Surinamers to leave the country (Hoeft 2014, 142). Among those who stayed were church women who protested the government (*Jamaica Observer* 2016; Hoeft 2014, 142). The regime continued to exert control through a succession of nominal civilian administrators until 1987, when international pressure finally forced a democratic election. However, in 1990, the military overthrew the civilian leadership, but a democratically elected government formed through a four-party coalition returned to power in 1991. Four more parties joined the coalition in 2005, and these eight parties were in power until 2010, when Bouterse and his coalition were elected (CIA 2017).

Bouterse's actions have not been ignored at the international level. Suriname's biggest supplier of development aid—the Netherlands—cut some of its aid in protest of an amnesty law that freed Bouterse and others from previous crimes (BBC 2013; CIA 2017). In 2015, elections were held again, and Bouterse was reelected as president after he ran unopposed (CIA 2017). Despite his reelection, many in Suriname continue to agitate for Bouterse to face trial (*Jamaica Observer* 2016).

Successive waves of migration, forced and free, have created a culturally and ethnically diverse population. In 2016, the population was 585,824 (CIA 2017). At 37 percent, Hindustanis, or East Indians, make up the largest ethnic group. Creoles (people with mixed white and black heritage) are 31 percent, and Javanese comprise 15 percent of the population (CIA 2017). Maroons (descendants of enslaved Africans) freed themselves and escaped to Suriname's interior forests. In the 17th and 18th centuries, they created their own autonomous communities and villages along the Coppename, Saramacca, Suriname, Tapananoni, Marowijne, and Lawa Rivers. Maroons make up 10 percent of the population and divide themselves into several bands: Saramacca and Ndyuka (about 50,000 each); Paramaka and Aluku (also called Boni) (about 6,000 each); Matawai (about 4,000); and the Kwinti (about 600) (CIA 2017; van An del 2012, 140; Heemskerk 2005; Price and Price 2005). Seeking work and educational opportunities, many leave the interior for cities and the Netherlands. Amerindians, or indigenous peoples, are 2 percent (approximately 20,000) of the population and primarily

live in the south and coastal savannah region (van An del 2012, 140). Chinese are 2 percent, whites are 1 percent, and 2 percent of the people are not assigned an ethnic category (CIA 2017).

Suriname is a young country, with 42 percent of the population under the age of 24. In this age group, males (128,149) outnumber females (123,195). The next largest group is those aged 25–54 years, who make up 44 percent of the population (132,334 males and 127,562 females). People aged 55–64 years are 6 percent, and people over the age of 65 comprise 5 percent of the population (CIA 2017).

Dutch is the official language, and it is used for education and government and is common to all in Suriname regardless of the language(s) spoken at home or in a community (CIA 2017). English is also widely spoken, as is Sranang Tongo (Surinamese). Sometimes called Taki-Taki, Sranang Tongo is native to Creoles and popular among Suriname's youth. It draws on English, Dutch, and Portuguese and is sometimes considered Suriname's lingua franca (CIA 2017; Romero 2011). The Javanese community speaks Caribbean Hindustani (a dialect of Hindi), and Portuguese and Chinese are spoken due to Brazilian and Chinese migration for work (CIA 2017). While the six Maroon societies retain their own unique languages, commonalities exist among the Saramaka, Matawai, and Kwinti and the Ndyuka, Aluku, and Paramaka (Price and Price 2005). With so many options, it is not uncommon for the language spoken to be determined based on the situation.

Suriname's diversity extends to religions practiced. Surinamers identify as Hindi (27.4%); Protestants (25.2%, predominantly Moravian); Roman Catholic (22.8%); Muslim (19.6%); and indigenous beliefs (5%) (CIA 2017). A simplistic version of Suriname's story describes the country's ethnic groups as interacting as a little United Nations; in reality, it is a day-to-day positioning of one's ethnic identity due to one's "colonial racial heritage, economic class, and ethnopolitics" (Tjon Sie Fat 2009, 2).

Suriname is noted for its intact rain forest. The government promotes tourism, and tourists from the Netherlands are the most common (Romero 2011). However, competition for Suriname's natural resources has long come from major international corporations, which has affected the landscape, as has illegal, small-scale gold mining by Brazilians, called *garimpeiros* (Romero 2011). Other natural resources include hydropower, fish, shrimp, and various minerals, such as aluminum, kaolin, bauxite, nickel, copper, platinum, and iron ore. Deforestation is a concern, as timber is harvested and exported (CIA 2017).

Overall, the country is in a postindustrial demographic transition, characterized by a low fertility rate, a moderate mortality rate, and a rising life expectancy. However, for the Maroon population of the rural interior, this is less so due to limited educational opportunities and access to contraceptives, higher malnutrition, and significantly less access to electricity, potable water, sanitation, infrastructure, and health care (CIA 2017).

Overview of Women's Lives

Women's lives and progress toward equity has progressed in some key areas: notably, more girls are able to access primary education, women's lives are less at risk when giving birth, and Suriname is combating HIV/AIDS and malaria. Importantly, it has ratified international agreements that affect women and adopting national legislation that lays the groundwork to implement the intent of such agreements (Hoeft 2014, 6). It is anticipated that this implementation will level social and economic inequities and access to day-to-day services and serve to upend the traditional gender ideology that women face at home and in the public sphere (6). By following through on legislative and policy changes, Surinamese women would benefit from structural mechanisms that mark their progress and show how the interplay of women's gender, ethnicity, and socioeconomic status serve to enhance or detract from their empowerment or continued discrimination (7).

All of these combine to influence Suriname's Gender Inequality Index (GII), which ranked it 100th out of 188 countries worldwide and gave it a value of 0.463 in 2014. The GII specifically evaluates women's reproductive health, empowerment in terms of political representation and levels of education, and participation in the labor force (UNDP 2015). The index points to where Suriname can change policy to foster women's equity.

Girls and Teens

Even though Suriname is placed in the high development category, educational and work opportunities remain limited for adolescent girls, especially those living in rural areas (UNDP 2015). Barriers to educational and professional success include violence against children in the home, early marriage, teen pregnancy, and poverty (CEPAL n.d.). Corporal punishment and violence toward children is widely accepted; 87 percent of children under the age of 15 are subjected to violent discipline by their caregivers (UNICEF 2016).

Reproductive health education and contraception are not yet widely disseminated to teenagers, resulting in a high level of unintended teen pregnancies. In 2016, the adolescent birth rate was 62 per 1,000 for girls ages 15–19 (UNICEF 2016). The teen pregnancy rate is even higher for girls living in the interior, and approximately 1 of every 10 young women is married or has a partner before the age of 15. Fifty percent are married before the age of 18 (UNICEF Suriname 2016). The nonprofit Stichting Lobi (Lobi) (Love Foundation) supports teen sexual health by training teens to participate in service delivery as advocates and peer health coaches. In addition to providing contraceptives through its clinics, it makes condoms available at schools and other locations where teens gather (IPPF 2014).

With 41 percent of children living in poverty, sexual activity is prevalent and contributes to teens not continuing with their education, as the need for work overrides the desire for education (UNICEF 2016). Children in rural villages are especially affected, as their families may not have the funds needed for them to attend school (UNICEF Guyana & Suriname 2016). A 2006 estimate found that 6 percent of children aged 5–14 were working (CIA 2017). Unemployment for 15- to 24-year-olds was 15 percent. Eleven percent of young men were unemployed, according to a 2013 estimate, and young women were almost twice that at 21 percent (CIA 2017).

Suriname's government has committed to working with the UN Development Programme to achieve the Gender Equality Seal, a certification process that guides countries as they evaluate their current gender equality status and provide a framework for developing a strategy for gender equality (UNDP 2016). To achieve gender equality, progress must start with young girls, and Suriname shows its commitment to this by working toward attaining the Equality Seal through examining and eradicating discrimination against young girls and female adolescents (CEPAL n.d.).

Education

Suriname has universal education, which includes primary education through grade 12. All years are mandatory (BSR 2017).

Access to university education is becoming available through Anton de Kom University (AKU) and its partnerships with other universities. AKU now offers a master's in public health through Tulane University's School of Public Health and Tropical Medicine in the United States. Since

the 1980s, more women have participated in higher education than men (Hoefte 2014, 216). Women attending university is valued and encouraged, which is reflected in the saying, “Your diploma is your first man” (20).

Even though some students face barriers in accessing education, others point out the need for better resources for their schools, and reports find that teachers are unskilled or underskilled. Despite this, 95 percent of those aged 15 and older can read and write. School is usually taught in Dutch (CIA 2017).

Health

Suriname spends 5 percent of its gross domestic product (GDP) on health care, ranking it 115th out of 191 countries (CIA 2017). The constitution mandates that the Ministry of Health promote its people’s health through a focus on the improvement of work and daily life and that it safeguard health care across the country (Sijem 2014). In the late 1970s, it ceded responsibility of care for communities in the interior—about 50,000 people—to a private nonprofit, Medical Mission (MZ). Three Christian medical missions form MZ. A decade later, a regional health service was created to provide care for coastal communities—about 145,000 people—many of whom are low-income and eligible for services from the Ministry of Social Affairs Housing, while many others are covered by the State Health Insurance Foundation. These actions follow the ministry’s philosophy of acting as a coordinator between the government, professional, and nongovernmental organizations (NGOs), which act autonomously to realize the goal of making care accessible, available, and focused on primary care (UNDESA n.d.).

Access to Health Care

During the economic downturn in the 1980s, many health care providers left the country for better pay. The health sector is also challenged by a lack of resources, such as drugs and medical equipment. In response, the government is focusing on controlling costs, promoting women’s and primary care health outcomes, converting public hospitals into private ones, and bolstering the nonprofit care providers’ responsibilities (UNDESA n.d.).

A 2014 presentation reported on the status and future plans of Suriname’s health care system. At that time, the regional health service provided primary care through 43 health clinics along the coast, and the MZ did the same in its 56 health clinics in the interior. The ministry planned

to upgrade and expand facilities, set up hospitals in rural areas, and offer more services through the clinics, such as 24-hour availability, emergency, chronic, and specialist care (Sijem 2014). The ministry also indicated plans for creating a health card for people who frequently cross the border and reported progress with addressing chronic and infectious diseases, with malaria almost being eliminated. The ministry also shared that it continues to provide high vaccination coverage and that it had work to do in the areas of school, maternal, and child health (Sijem 2014).

Maternal Health

About 60 percent of Surinamese women turn to Stichting Lobi (Lobi) clinics to meet their family planning, reproductive, and sexual health needs. With the slogan “Live a Responsible Love Life,” Lobi’s philosophical approach is to promote agency over one’s choices. Services include access to contraception, testing for sexually transmitted infections, gynecological care, and pregnancy testing. With Lobi and other providers, contraception prevalence reached 48 percent by 2015 (UNICEF 2016). Lobi also offers services to prevent cervical cancer and HIV. To support women in rural areas or those who are marginalized, Lobi has mobile clinics, and clients may pay on a sliding scale (IPPF 2014).

Women who become mothers face a maternal mortality rate of 155 deaths per 100,000 live births as of 2015, a rate that is up from 130 in 2013 (CIA 2017; WHO 2015). Ninety-one percent visit a health care provider at least once, and 67 percent make at least four visits; 91 percent have a skilled provider attend their birth, and 92 percent give birth in a facility while the remaining do so at home. As of 2015, the fertility rate was 2.3 children per woman, down from 1990’s rate of 3.3 (UNICEF 2016), and the infant mortality rate was 25 per 1,000 live births (CIA 2017). Neither the maternal mortality ratio nor the under-5 mortality rate (23 per 1,000 live births) meets the baseline Millennium Development Goals of 84 and 48, respectively; both rates are higher than the region (WHO 2015).

Abortion is illegal, and women who cause their own or who have another induce one can be punished with up to 3 years’ imprisonment for doing so. For women who obtain an abortion from another person, that person is subject to 4 years and 6 months in prison, or 12 years if the woman did not agree to the abortion. Medical practitioners are further penalized for providing this service (Women on Waves n.d.). According to the Center for Reproductive Rights, even though abortion is illegal, it may be possible

to obtain one when saving a woman's life because it is seen as a necessity. This is similar to its neighbors, such as Brazil and Venezuela, but unlike Guyana and French Guiana, who both have more women-centered laws (Center for Reproductive Rights 2017). Some have recognized the punitive nature of Suriname's law and advocated for changing the law or have supported women in creative ways, such as by making the abortion pill available through Women on the Web's mail-order service (Women on Waves n.d.). Changing the law would bring Suriname into alignment with its obligations as a signatory to the Convention on the Elimination of All Forms of Discrimination against Women (CEDAW), which calls for women's equal rights, including health care and in particular care related to family planning (Castelen 2009, 2–6).

Diseases and Disorders

Surinamers are living longer, with women typically living 74 years and men 69 years (CIA 2017). This is similar to the average life span of many other countries, according to the World Health Organization (WHO 2015). During their longer lives, Surinamers face on average 12 years of lost health due to illness and disability. The most common causes of death are cardiovascular disease and diabetes. Other diseases that cause death include cancer, respiratory and other infectious diseases, and HIV/AIDS. Between 2000 and 2012, diabetes, self-harm, and heart diseases all increased, and HIV/AIDS decreased (WHO 2015).

HIV/AIDS

Young people aged 25–29 had the highest number of new infections of HIV in 2008, and girls and young women were disproportionately affected. Suriname has been able to reduce the rate of folks contracting HIV in part due to promoting the use of condoms. For example, its Youth Advocacy Movement (YAM) promotes an ABC program of abstinence, being faithful (monogamy), and condom use.

Employment

Women's participation in the labor force has grown from 37 percent in 2005 to 39 percent in 2010, and during the same time frame, men's participation grew by 1 percent, from 67 percent to 68 percent (all based on estimates) (UN Statistics 2017). At 48 percent, the majority of employed women work in the services sector; this is followed by

agriculture (20%) and industry (10%), all according to 2013 data (ILO 2015).

Labor statistics do not capture the full breadth of women's participation in the labor force because much of their work goes unrecognized. Unrecognized work takes place in what is called the *informal economy* and takes many forms: street vendors selling their products, such as food or herbs at the market; domestic workers; child and elder care providers; and those who farm, hunt, and fish at a subsistence level to meet their families' needs (Advameg 2017).

Despite the higher rate of women getting university degrees compared to men, women are still clustered into lower-paying, lower-status jobs and have less access to jobs (Hoeft 2014, 20, 216). Even though younger women can increasingly choose to work or be a stay-at-home parent, most women still encounter gender discrimination (20).

A 1992 study found an even distribution of ethnicity for both higher-paying, such as executives and entrepreneurs, and blue-collar jobs. However, Creoles and Maroons clustered in jobs such as teaching, nursing, cleaning, and catering. Asians were clustered in such jobs as shopkeepers, traders, and drivers (193). The Chinese are often viewed as minorities because many do not speak Dutch, and, due to inherited colonial stereotypes, their lighter skin is considered to benefit them socioeconomically. In their lived work experience, many Chinese navigate the stratification between white and black (Tjon Sie Fat 2009, 3). In a 2005 study, many Hindustanis held agricultural jobs (Hoeft 2014, 193). This concentration is ascribed in part to stereotyping of Asians as being naturally predisposed to growing rice (9). Hindustani women have higher unemployment rates due to cultural expectations, which hold men to the role of financially providing for their families (193).

In 1976, Suriname ratified the UN legislation granting refugees and citizens equal treatment under the Social Security Convention of 1962. This grants a range of benefits, such as old-age benefits, medical care, and maternity benefits. While the Surinamese government has ratified or agreed to various UN policies around work, many still live in poverty, and women do not have full access to employment.

Family Life

Suriname is considered to have a patriarchal society in which men are the head of a family (Hoeft 2014). This cultural trait has been more common to Hindustani families

compared to Maroon families, who tend to be matrifocal, or headed economically and emotionally by women (Advameg 2017). Women grapple with various discriminatory or limiting beliefs, for example, some working-class women may be looked at as “immoral” for holding jobs outside the home. Dark-skinned and Creole women may be presumed to be matriarchal, while British Indian women may be labeled “submissive” and Javanese women may be labeled “sexually promiscuous” (Hoeft, 2014, 9).

LGBTQI

Overall, Suriname is not considered welcoming to the LGBTQI community. In a 2014 report to the UN Human Rights Committee, advocacy organizations reported open hostility toward LGBTI people despite the Surinamese Constitution’s recognition of personal freedom and security as rights as well as the right to not be discriminated against based on any status (LGBT 2014; WIPO n.d.). Gay and transgender sex workers are particularly vulnerable to what are considered weekend “clean ups,” where the police harass, intimidate, and arrest them. Lacking specific policies, legislation, and uniform acceptance from government officials, members of the LGBTI community experience discrimination in all areas of their lives. Discrimination includes a lack of marital rights, as same-sex marriage is illegal; the law defines marriage as between one man and one woman. Barring marriage means same-sex couples are also prevented from inheriting their partner’s property or belongings, and they are ineligible for their partner’s pension after death—rights automatically granted opposite-sex couples, whether legally married or not (LGBT 2014).

Transgender persons also face discriminatory practices in the form of structural violence, or the systematic social structures causing harm to people, as the government has consistently failed to create protections to support this community and has not enforced the structures offering gender-based protections (Burtles 2013; LGBT 2014). One example of structural harm is the lack of protections allowing transgender women to work as teachers; instead, the only way they can work as teachers is if they dress in line with their biological sex. Transgender teens face the same issue; they are not allowed to dress according to what they identify as their gender identity or expression (LGBT 2014).

Progress has come in some areas. For example, same-sex activity is legal, as are the rights to adopt, to serve in the military, and to have one’s sexual orientation protected from employment discrimination (Equaldex 2017).

In 2010, a study ranked Suriname 15th out of 25 countries in the Americas in its support for same-sex marriage. Canada, Argentina, and Uruguay were the three most supportive, and El Salvador, Guyana (Suriname’s southern neighbor), and Jamaica were the three least supportive. The study also found that people with higher levels of economic development and education indicated significantly more support for same-sex marriage (Lodola and Corral 2010). Suriname’s status in each area explains its ranking in the middle of the list.

LGBTQI members advocate for their rights and foster community building through pride parades. In 2013, Suriname hosted its third annual march. Since 2011, the organization LGBT Platform Suriname has organized an annual OUT@SU pride parade. One theme has been sexual diversity in the workplace (GayStarNews 2013).

Politics

As with many colonized countries, violence, authoritarian control, contestation, and resistance marked Suriname’s transition from a Dutch colony to an independent country (Hoeft 2014, 1–3). In 1948, Surinamers gained universal suffrage (3). One year after suffrage, Suriname held its first general elections. In 1954, it became autonomous; two decades later, it was deemed an independent republic (3). It celebrates its independence, obtained in 1975 from the Netherlands, on November 25 (CIA 2017). Former Surinamese governor Johan Ferrier (1910–2010) became the first president in 1975, and Henk Arron became prime minister (BBC 2012). Both represented the National Party (NPS), and while Ferrier had historically advocated for unity among all ethnicities, in practice, Creole elites benefited from his rise (CIA 2017; Hoeft 2014, 95).

In 1979, the military, led by Lieutenant-Colonel Bouterse, forced a coup of the civilian government. Promises of democracy were replaced with repressive tactics, which led to open protest by the Surinamese. Their open revolt was quelled in 1982 by the “December murders” (Hoeft 2014, 24; CIA 2017). In response, the Netherlands and the United States cut economic aid (BBC 2012), contributing to an economic downturn (Hoeft 2014, 24). Resolution to this massacre for relatives and the country as a whole remains elusive, as investigative efforts are regularly circumnavigated (Hoeft 2014, 3, 24; CIA 2017). During this time, Maroons in the interior region held an armed revolt. Hundreds died during the Interior War, and it was five years before the Maroons signed a peace treaty.

Even though Bouterse was forced to step down, he later reemerged and was elected president in 2010 after forming a large coalition among many political parties (Hoeft 2014, 24; BBC 2012). Presently, Suriname is considered a presidential republic, having ratified the current constitution in 1987, with Bouterse continuing his reign as president (CIA 2017).

To the disappointment of the Committee Commemorating the Victims in Suriname, the Organisation for Justice (OFJ), and others hoping to bring Bouterse to justice for his role in the “December murders,” he eluded trial in 2016 through what is seen as a loophole. The chair of OFJ, Betty Goede Jong-a-Liem, expressed her hope that the Surinamese government would not protect those responsible for the murders (*Jamaica Observer* 2016).

Except for the presidency, women have been appointed to or voted into the State Council and the National Assembly (DNA)—the highest levels of government. The 51 DNA members are elected to five-year terms through secret ballot and hold legislative authority along with the government. The current chair of National Assembly and speaker of the Parliament, Dr. Jennifer Geerlings-Simons, is serving her second term in the latter role (UNDP 2017). After a career as a medical doctor and professor at Anton de Kom University, she has been elected to the assembly three times (Summit of Women Speakers of Parliament, n.d.). Another notable woman leader was Minister of Social Affairs and Housing Alice Amafo. She was the first Maroon woman and the youngest minister when first appointed at age 28 in 2005. She was inspired to enter politics after visiting the interior and seeing the living conditions that offer few educational and work opportunities. She joined the Maroon Women’s Network and the cooperating Maroon Experts (CGM 1977). After the 2015 elections, women held 13 of 51 seats, which at 25.5 percent is close to the average of 27.7 percent for countries in the Americas (IPU 2016).

Religious and Cultural Roles

Many religions are practiced; Creoles and Maroons tend to be the largest practitioners of Catholicism and Protestantism. Hindustanis typically practice Hinduism, though some practice Islam or Christianity. Within the Javanese community, many are Muslim. A Jewish community of about 2,700 also exists. Jews originally fled to Suriname during the Spanish Inquisition and established a synagogue in 1719, which later, in 1835, became the Neve Shalom

synagogue (Connelly-Lynn 2015). In addition to being a religiously diverse country, many people reflect this diversity by practicing one or more religions. For example, some people practice Catholicism because they attended Catholic school while also attending Protestant or Hindi services to join their family members (Hoeft 2014, 10–11). That the synagogue is located next to the Ahmadiyya Anjumar Insha’at Muslim Mosque in Paramaribo is often said to exemplify Suriname’s acceptance of many religions, while some may point to the presence of Hindi temples dotting entrances to many homes throughout the city along with other churches (Connelly-Lynn 2015).

Winti

Many Maroons practice Winti (wind), a syncretic religion carried over from Africa and influenced by Amerindian beliefs, Christianity, and Judaism (van Andel 2012, 140). Winti practitioners believe in invisible, supernatural spirits that can control a person through dance, music, prayers, or herbs, unless specific, regular offerings are made to appease the spirits or to make peace with an ancestor and thus prevent disease and bad luck (140). Some believe that unbalanced interactions with nature, such as river pollution, cutting specific trees, or overhunting, can also upset spirits and result in illness or misfortune (140).

Winti practitioners believe that many plants and trees are sacred and magical. They may harvest plants from forests considered sacred or may cultivate them in their own gardens for their personal use or for sale at the Paramaribo market, which provides a small income (143). Sacred plants, leaves, or bark have many uses and are frequently used in herbal baths to promote spiritual well-being, personal happiness, good fortune, or cleansing from evil spirits (141).

Forests and trees considered sacred by Winti practitioners are vulnerable to several forces: migration of Maroons from the forested interior to urban areas; extraction industries including mining and logging; the possibility of evangelical religions overtaking Winti beliefs; and Maroons lack of ownership, or title, to their traditional forests (139). The Suriname federal government holds title to the land and wants to promote income-generating activities that multinational corporations based in the United States and China could provide (140). Scholars have pointed out that respect for Winti practices could contribute to environmental and forest preservation (140). Even though many Maroons live in urban areas and adopt Winti practices, the

loss of Maroon youth to other religions and their migration to cities for work bodes poorly for the passing on of this traditional culture (144). This “cultural destruction” also affects Amerindians (144).

Along with religious celebrations, numerous secular holidays are celebrated—some reflecting days unique to Suriname’s history or celebrating the traditions of one of the ethnic groups. Ketu Koti, or broken shackles, honors Emancipation Day, when enslaved Africans freed themselves (Ibuka News 2015). Maroon Day recognizes the signing of a peace treaty between Okanisi/Ndyuka (Maroons) and the Dutch. Independence Day celebrates Suriname’s independence from the Netherlands (Advameg 2017).

Art and Culture

Oral traditions are appreciated by many communities, as is music. While kaseko and kawina music is popular among Creoles, gamelan orchestras are associated with the Javanese. Artists in other areas, such as writers and painters, are not supported by the government or private organizations, causing many to leave to live and work in the Netherlands (Advameg 2017).

Issues

Suriname faces three significant transnational issues: ongoing border disputes between Suriname and its northern neighbor, Guyana; trafficking of women from nearby countries through Suriname; and transshipment of drugs through the country. The border is located along the lush, dense forest, where it is not always easy to patrol for drug trafficking. Many Amerindians and Maroons cross the border, seeking French Guiana’s better social security (Hoeft 2014, 214).

Human Trafficking and Violence against Women

Suriname is a source, destination, and transit country for women, men, and children who are subjected to sex trafficking and forced labor. Women and girls from Suriname, Guyana, Brazil, Venezuela, and the Dominican Republic are subjected to sex trafficking. Trafficking often occurs near mining camps in the interior and brothels in homes, which are harder to detect and have increased in number. The government has yet to meet the minimum standards to prevent and eliminate trafficking (U.S. Department of State 2016).

Trafficking extends to forced labor, to which men, women, and children are subjected. Chinese migrants are vulnerable to forced labor in agriculture, on fishing boats, in the service industry, and in construction, while children can fall victim to dangerous gold mining, where among other risks, they may be exposed to mercury. While there have been calls for the government to fight trafficking by prosecuting traffickers and by providing financial and other support to antitrafficking organizations, the government has failed to respond (U.S. Department of State 2016).

Migration

Immigrants who come to Suriname for work arrive mostly from Haiti, Brazil, China, and other Caribbean countries. Many Surinamers have become concerned about whether public funds will be used to pay for immigrants’ education, social services, and housing needs. Likewise, many Surinamers immigrate to the Netherlands, French Guiana, and the United States. Suriname’s immigration rules are flexible, and the country is easy to enter illegally because rain forests obscure its borders. Since the mid-1980s, Brazilians have settled in Suriname’s capital, Paramaribo, or eastern Suriname, where there is gold mining. Some Brazilian women have migrated to Suriname and married Surinamese (197).

U

United States of America

Overview of Country

The United States of America—or the United States, America, or “the States”—is the fourth-largest country in total area at 3.79 million square miles (9,833,517 sq. km) (CIA 2017). Forty-eight states plus the District of Columbia compose the continental United States, which is situated between Canada to the north, the Atlantic Ocean to the east, Mexico to the south, and the Pacific Ocean to the west. Alaska, the largest state, borders the Canadian Yukon Territory and British Columbia to its east. Hawaii, the 50th state in the union, is a series of islands in the central Pacific Ocean. The United States claims 14 territories (5 populated and 9 unpopulated) in the Pacific and the Caribbean. As its states and territories range from the Arctic to the tropical, the United States has an extremely diverse geography and climate, which supports a wide variety of wildlife, agriculture, and aquaculture.

Native American nations, each with distinct languages and cultures, inhabited the lands currently called the United States of America. European colonization began in the 1500s, when the Spanish entered the Southwest and Florida. France, England, the Netherlands, Sweden, and Russia have all colonized different parts of North America for its land and natural resources, destroying indigenous nations and exiling survivors to less desirable locations.

The Spanish, French, English, and Dutch brought enslaved Africans to the Americas. Descendants of the English colonists engaged in the slave trade became the most influential people in the original 13 colonies on the East Coast. With the help of France, the Netherlands, Spain, and other countries, the colonies overthrew the British in the Revolutionary War. The Treaty of Paris (1783) ended the war and recognized the sovereignty of the newly named United States over all land south of Canada, north of the Gulf of Mexico, and east of the Mississippi River.

In 1803, France sold its North American holdings west of the Mississippi and south of Canada to the new U.S. government. Over time, whites from the original, as well as European immigrants and indentured laborers, made their way westward, disenfranchising Native Americans and bringing in slaves and immigrant labor to build railroads, cut timber, and farm the land, eventually reaching the Pacific Ocean in 1844. Railroad magnates sought Chinese labor to lay track and blast tunnels into mountains to connect tracks from the Pacific to those from the Atlantic. As Northern states experienced their industrial revolution, Northern and Southern states developed different opinions on maintaining slavery. The South seceded from the Union, and the North and South fought the Civil War (1861–1865).

The Union victory resulted in the emancipation of the slaves in 1865, giving African American men some of the same rights as white men, including citizenship, the right

to own property, the freedom to seek an education, and the right to vote. Despite these freedoms, African Americans in Southern states were segregated from whites, forced to live in separate communities, attended separate schools, and used separate public amenities. Native Americans were removed to reservations and forced to send their children to boarding schools, where they were stripped of their culture and language through humiliation, abuse, and Christian missionary teachings. World War II was an awakening for African Americans, gays and lesbians, and women. For the first time, they had access to good-paying jobs and opportunities in the military. At the same time, the federal government interned thousands of innocent Japanese Americans in relocation camps without evidence of disloyalty to the United States.

The Civil Rights Act of 1964 was the first federal law to criminalize discrimination based on race, color, religion, sex, or national origin. The law offered some protection to religious minorities and Asian immigrants. While many amendments to civil rights legislation have been made since then, not all states interpret and apply these laws in the same way. Despite the 2008 election of an African American president, Barack Obama, racial, economic, and gender inequalities persist.

Overview of Women's Lives

The United States is the third-largest country in population, with nearly 319 million people as of 2014 (USCB 2015). The United States is one of the world's most ethnically diverse and multicultural nations due to generations of conquest, the slave trade, and immigration from around the globe. Although many Americans are descended from farmers, trappers, buffalo hunters, cowboys, miners, and fishermen, approximately 80 percent of the population today lives in urban areas.

The majority of the population is female and, increasingly, multicultural. Recent estimates state that 51 percent of the population identifies as female (USCB 2015). These numbers do not include active-duty military personnel, where approximately 20 percent of the military population is female-identified (Patten and Parker 2011); the incarcerated and those under surveillance, of which approximately 1 million are female-identified persons (The Sentencing Project 2010); the institutionalized; nor the homeless.

It is said that, by 2050, women of color will make up 53 percent of the female population; 1 out of 4 American women will be Latina, 1 out of 10 will be African American,

and 1 out of 10 will be Asian. The number of women who identify as biracial or multiracial is also increasing. By 2050, white women will drop from 61.8 percent of the American female population to 47 percent. Immigration will continue to drive this increase in racial and ethnic diversity. At this time, a gender imbalance exists in Muslim, Buddhist, and Hindu communities because single men are most likely to immigrate to the United States for school and work (Ahmed and Iverson 2013).

As the visibility of LGBTIQ populations increases in schools and the media, and legislation for LGBTIQ civil rights and same-sex marriage increases across the United States, the number of women who self-identify as lesbian—as well as the number of biologically determined men who identify as female—will increase. At this time, no official statistics exist for bisexual female, lesbian, or male-to-female transgender populations. As of 2015, the U.S. Supreme Court legalized same-sex marriage for all 50 states, but most states still do not have antidiscrimination laws that include protections for sexual orientation and gender identity. Lesbians and male-to-female transgender people could risk harassment, denial of housing, or employment termination if they come out in some regions of the United States.

In the 21st century, the U.S. Census Bureau has started to count same-sex couples. As of 2013, 52 percent of same-sex couples were female and more than twice as likely as heterosexual couples to be interracial. More female same-sex couples lived in poverty than male same-sex couples or heterosexual couples, even if both partners identified as employed. Female same-sex couples of color were more at risk for living in poverty than white same-sex couples (USCB 2013).

In 2014, the United States ranked 5th out of 187 nations based on the Gender Inequality Index (GII, 0.262) (UNDP 2015). Despite this, U.S. women have still not achieved full equality with men. While the federal civil rights law Title IX prohibits discrimination against women in all areas of education, girls and young women still receive messages from parents, teachers, peers, and the media that good girls enter caregiving professions, such as teaching or nursing, or become paralegals or dental assistants instead of lawyers or doctors. Traditional “female” professions earn lower salaries than “male” professions. Even if men and women hold the same position, it is likely that female employees will receive lower salaries than men. Girls are still raised to believe that their focus is to find a partner and have children. Even lesbians, particularly those in committed

Trans Women in the United States

An underrepresented and often invisible female population in the United States is the male-to-female (MtoF) transgender population, also known as *trans women*. Born in male bodies, MtoF transgender people see themselves as female and want to live as girls and women. Due to the persecution they face in many parts of the United States, many trans women go “stealth” (i.e., present as female and hide their male identity) or choose to live as men until they feel safe enough to transition. Also, the federal government gives each state the right to classify each person, male or female, as they see fit on birth certificates and drivers’ licenses. For these reasons, the number of trans girls and trans women in the United States remains unknown.

Although trans women existed in European cultures, they did not have a name for themselves. European laws often identified people who dressed in the clothing of the opposite sex as “sodomites” and illegalized such behavior. When European explorers encountered Native American tribes for the first time, they noticed that most tribes included men who dressed and lived as women. Most of the time, those cross-dressing men were tribal healers and shamans and considered sacred by their people. French explorers called these shamans “berdaches,” after the Persian dancing boys who dressed as girls. Colonial powers viewed the berdache as an abomination against Christianity, and from colonial times onward, governments in the United States were committed to stamping out gender nonconformity through “Christian” education and severe punishments for Native Americans and all other communities.

Many trans girls do not live openly as female until adulthood. Their parents may discourage them from playing with traditional toys for girls and dressing up in female clothing, which often leads to depression and self-harm. Trans girls are often at high risk for bullying in K–12, and may not find adequate support in college, even if their school has an LGBT resource center. Those who disobey their parents may be sent to psychologists, physically abused, or kicked out of their homes. For this reason, trans women—particularly trans women of color—are at high risk for homelessness, substance abuse, prostitution, and HIV/AIDS. Trans women in desperate situations may end up in prison for stealing money to cover their medical costs or for defending themselves against abusive intimate partners. Federal and state prison systems are investigating the feasibility of housing trans women in women’s prisons and allowing them hormone therapy or sex-reassignment surgery during their incarceration for their safety while in prison.

Those trans women from accepting families who complete their education and seek employment may have trouble living as their true selves or paying for hormone therapy or sexual reassignment surgery with their employment-sponsored health insurance. As of 2014, only 18 states prohibit discrimination against gender identity, and most of those states only protect employees working for the state. Trans girls and trans women in rural and inner-city environments are most at risk for harm, particularly in religious communities and communities of color. While trans women may identify as straight, bisexual, or lesbian, some in the lesbian community may reject them as “not real women.”

As transgender visibility increases in the United States, more parents are learning about accepting their trans girls. These parents allow their male-born children to dress as girls and go to school as girls if this is what they desire, meeting with their teachers before school starts to introduce their trans daughter and to speak of her as female. More schools are providing gender-neutral bathrooms and preferred name policies to provide a safer environment for trans girls. While K–12 teachers and administrators are working on antibullying policies, many still have transphobic attitudes and place the blame on trans girls for their persecution at school.

As trans girls want people to read them as female, they sometimes will overcompensate and conform to the heteronorms for enhanced femininity, which affects the subjects they may prefer in school as well as their career or relationship choices. As trans girls and trans women meet others like themselves through online or face-to-face support groups, they discover that trans girls and trans women express a wide range of female identities and receive the medical and legal information they need to complete their journeys as they choose to.

International Transgender Day of Remembrance

Across the world, transgender people are murdered in dismaying numbers. In the first four months of 2015, 100 murders of transgender and gender nonconforming people were reported worldwide. From January 2008 to April 2016, 2,115 transgender and gender nonconforming people were reported murdered across 65 countries (TGEU 2016).

The International Transgender Day of Remembrance began as an Internet project in 1998 called “Remembering Our Dead” and a candlelight vigil in San Francisco in 1999. The annual event is held in November to commemorate the murder of Rita Hester on November 28, 1998 (a murder that has never been solved). Now, the event raises public awareness of violence against transgender people and creates a space for mourning, support, and encouragement (TDOR 2016).

According to Transgender Day of Remembrance founder Gwendolyn Ann Smith, “The Transgender Day of Remembrance seeks to highlight the losses we face due to anti-transgender bigotry and violence. I am no stranger to the need to fight for our rights, and the right to simply exist is first and foremost. With so many seeking to erase transgender people—sometimes in the most brutal ways possible—it is vitally important that those we lose are remembered, and that we continue to fight for justice” (Smith 2016).

relationships, feel pressured to have children. Simultaneously, women with children are expected to work to help support the family.

As the millennial generation (born between 1981 and 2001) earns much less than generation X (born between 1961 and 1981), children are living with their mothers for

longer periods of their adulthood. It is not uncommon for American women to look after grandchildren while their adult children live close by or in the same residence. Balancing finances, work, child care, and a personal life remains a huge stressor for many contemporary American women.

Girls and Teens

Girls of all backgrounds face a cruel double standard. While the media now tells girls that they should be independent, competitive, and ambitious, they also face expectations to be pretty in pink (feminine), to conform to social norms, and to marry. This culture of enhanced femininity, where women conform to the needs and desires of men, can erode gains that girls make in education, and it has long-term effects on their adulthood. Although American society tolerates a wider diversity of feminine identities among heterosexual females than males, girls are more likely to receive pressure to satisfy the expectations of family, peers, and authority figures and to conform to social standards such as the following:

- social competency
- maintenance of a physical appearance that family, peers, and authority figures perceive heterosexual males will find attractive
- receptivity to physical intimacy and sexual intercourse with heterosexual males
- marriage at a childbearing age
- producing and raising children

When gender-normative behavior is driven by the desire to satisfy the expectations of others, it can lead to negative mental health outcomes in girls and women.

The media promotes a thin ideal of female beauty for white and Asian American girls. As early as age 6, girls begin to express concerns about their body shape or weight, and more than half of elementary school girls ages 6–12 report worrying about becoming fat (Smolak 2011). The number of teenage girls and young women diagnosed with eating disorders, such as anorexia nervosa, bulimia nervosa, and binge-eating disorder, is on the rise, with white girls from upper-middle-class backgrounds being most at risk for the disorders. Eating disorders often cause long-lasting, chronic physical and mental health problems that reduce female confidence and increase anxiety about their desirability and self-worth.

Education

Title IX of the U.S. Education Amendments of 1972 states, “No person in the United States shall, on the basis of sex, be excluded from participation in, be denied the benefits of, or be subjected to discrimination under any education program or activity receiving federal financial assistance.” Federal and state laws make elementary education mandatory for girls. While most American girls have an equal opportunity to complete high school and go on to college, girls from fundamentalist religious groups, such as the Amish and Hasidic communities, may have their education curtailed at eighth grade. Young women from these communities who wish to continue their education may be limited to certain types of schools or homeschooling. In some cases, girls from those communities who wish to pursue further education in secular environments risk being shunned or excommunicated.

Primary Education

To this day, the American education system encourages girls to *feel* while it encourages boys to *think*. Teachers in early grades remain predominantly female; subconsciously, they may promote “appropriate” behavior and gender norms to their male and female students. For example, girls may learn that it is okay to not understand math from female teachers who are more likely than male teachers to pass on *math anxiety*. Female teachers are also more likely to praise girls for cooperative rather than competitive skills. While a boy may be disciplined for *acting out* in the classroom, this type of behavior is *expected* from boys. If a girl consistently displays argumentative behavior that challenges authority, this behavior is seen as *unladylike*. The girl may be shunned by her female peers and experience some level of disapproval from her parents.

Secondary Education

As pedagogy shifts from individual to collaborative learning, girls may receive higher grades than boys on assignments where social competencies and communication skills are weighted more heavily than content or skill mastery. Boys tend to receive more coaching from parents and teachers to master academic content, rather than interpersonal skills to improve their grades. This gives boys an advantage in STEM disciplines (science, technology, engineering and mathematics), where they begin to catch up with, and outperform, girls in middle school.

Boys are more likely to take core science courses—biology, chemistry, and physics—in high school than girls. Recent reports found that, in some years, no female students took advanced placement (AP) courses or exams in physics or computer science, and once boys see their improved performance in these subjects, their confidence and participation increases. This may cause teachers to overlook how boys may dominate math and science classes, while girls suddenly play a more passive role. Girls may not understand why their grades go down in STEM classes where boys are present; they may become fearful toward the subjects or lose interest altogether. Researchers studying girls’ performance in STEM classes in girls-only schools note that their academic achievement is higher than girls in coed classes. There is also some evidence to show that when women in STEM disciplines mentor teenage girls in math and science, their confidence levels increase (APS Physics 2011; Hill et al. 2010).

Since the late 20th century, parents have been encouraged to allow their daughters to participate in sports. Athletic activity is not only good for a girl’s physical health, but it also promotes self-confidence, has the potential to increase self-esteem, and often improves a teenager’s chances to earn college scholarships. Unfortunately, girls who pursue competitive athletics receive mixed messages from their male and female peers as well as the media. Competitive, assertive female athletes are often accused of being lesbians while in middle and high school. This stigmatizes all female athletes and causes many heterosexual female athletes to perform at a lower level. “Lesbophobia” in women’s sports has a negative effect on team camaraderie. Female athletes may feel pressured to appear “feminine” or to pursue sexual intimacy with boys. They may underperform athletically, unintentionally reinforcing discriminatory behavior toward female athletes and women in sports.

Title IX has helped high school and college women’s sports teams receive equal resources and support from their institutions. At the same time, girls who would like to play on the boys’ football team or boys’ wrestling team are still often discouraged from doing so. While Title IX protects the right for pregnant or parenting students to stay on athletic teams, it does not protect the rights of transgender students who identify as female. Male-to-female transgender students who wish to play on girls’ sports teams still receive pushback from administrations who see these female-identified students as male. Female-to-male transgender students face the same discrimination if they want to play on boys’ teams.

Campus Pride Index

Do you want to attend a college or university that has been recognized for supporting sexual minorities? Check out the Campus Pride Index.

In development since 2001, the LGBT-friendly Campus Pride Index was created in response to the increasing demand for tools and resources to support campuses in assessing their policies, programs, and practices. The assessment tool relies on self-reported data to evaluate campuses on eight components: LGBT policy inclusion, LGBT support and institutional commitment, academic life, student life, housing, campus safety, counseling and health, and LGBT recruitment and retention efforts. The index can be used to determine how schools have been rated.

Campus Pride also has information on scholarships, and it coordinates LGBT-friendly college fairs in several locations around the United States. *The Advocate* and other media outlets also rate campuses on how friendly they are for sexual minorities.

To learn more about Campus Pride, visit their Web site: <http://www.campuspride.org>.

—Whitney K. Archer

Postsecondary Education

Until the mid-20th century, women seeking higher education attended women's colleges. This was because families did not want to encourage their daughters to have sexual relations before marriage, and they also believed that women should receive a different education than men. While some women's colleges provided a classical education, others simply trained women how to become pleasing wives and good mothers. Enrollment at women's colleges sharply decreased once men's colleges became coed. Another influencing factor was a series of lesbian pulp novels about students at Bryn Mawr and other women-only institutions that convinced the public that young women were at risk for becoming lesbians at women-only schools. While well-endowed women's colleges still exist, others have become coed or have closed due to declining enrollment.

Since the 1970s, higher education institutions have established women's centers and women's studies programs

to increase student awareness of gender inequalities and to empower female students. Unlike high schools, higher education institutions have also implemented safe-sex education programs and date rape awareness initiatives. However, not all institutions have made these programs mandatory for students. Today, women's centers often collaborate or merge with LGBTIQ resource centers to address the needs of cisgender and transgender students as well as students who may be born female but do not adhere to a gender binary.

While the percentage of young women and men who go to college is roughly equal, women are more likely to complete their college education and earn degrees. African American women, in particular, are more likely to complete their college education and earn degrees than African American men. At the same time, women do not apply to all degree programs in equal numbers as men. Female students are overrepresented in education, nursing, library science, speech therapy, and counseling, and they remain underrepresented in STEM majors.

Women who enroll in college may require support services such as child care to attend classes on campus. If affordable child care is not available at nearby institutions, women may be more likely to enroll in online degree programs than their male peers. In fact, female students make up the largest demographic of online classes in the United States.

While female students are more likely to complete their undergraduate education than male students, more male students go on to graduate school than female students—particularly at the doctoral level. Women who do not seek graduate education do so primarily because they choose family obligations over career aspirations. Women with children are less likely to complete doctoral programs than single women or men, especially if they already have sufficient employment where a doctoral degree is not a requirement for advancement.

Job Training

Experts believe that female mentors in STEM majors and careers will encourage the next generation of girls, but there is no significant evidence showing that female students who have female math or science teachers, or who have female mentors in STEM careers, are more likely to pursue STEM careers. Even if girls take biology, chemistry, and physics in high school, they are less likely than boys to take those subjects in college.

STEM careers also include the trades—electricians, plumbers, carpenters, and other hands-on professions. There is a shortage of highly skilled tradespeople, and many scholarships and job placement programs exist for women to pursue certification and receive preference in hiring. In vocational education programs, girls often receive inferior training compared to boys. Instructors in these programs are likely to be male and are often unaware of how to address deficits in a girl's knowledge of hands-on skills, which boys often learn with their fathers or other male role models.

The ADA Initiative, founded in 2011, is dedicated to connecting girls and young women interested in technology to help them learn coding and other computer skills from each other in safe, gender-neutral environments outside of traditional schools. Identifying as a feminist organization, ADA aims to reach women of color, disabled women, and lesbian, bisexual, transgender, and queer women around the world. Their antiharassment policy, advice on attracting female speakers to STEM events, and “ally skills workshop” have been adopted by hundreds of organizations.

Health

Historically, women have lived longer than men. Latinas and Asian American women are more likely to live longer than white, African American, or Native American women. Reasons for this longevity may include diet, physical activity, and family and community support. Women in Southern states have the lowest longevity. In poor rural areas of the country, particularly in the South, women are less likely to outlive men. Rural American women, the population least likely to finish high school, are more likely to smoke, abuse alcohol or other drugs, and eat processed foods than women who have received a high school diploma and attended college.

Access to Health Care

Access to health care varies depending on one's education level, income, mobility, and residence. Women who are employed full-time have their own transportation, have awareness of different types of health care, and live in affluent areas of the country have the most access to health care. Women living in rural or economically disadvantaged areas who depend on public transportation or are homebound, women with little education, and part-time

Women's Voices

Sejal Hathi

Sejal Hathi (1995–) is a Stanford University medical student who intends to integrate medicine, technology, and social innovation. She seeks the social and economic empowerment of girls and young women through her organizations Girls Helping Girls and girltank, which have mobilized 30,000 young women in 104 countries to design sustainable social change. Hathi helped found S2 Capital, an early-stage fund that invests equity and debt in young entrepreneurs in the developing world. She has been an adviser to UNESCO on youth development and women and girls and serves on the boards of Youth Service America and State Farm Insurance. Hathi's honors include a Forbes 30 under 30 Honoree, World Economic Forum Global Shaper, Harry S. Truman Scholar, and one of *Newsweek's* “150 Women Who Shake the World.”

—Jane Harris

Huffington Post 2015. “Sejal Hathi.” Retrieved from <http://www.huffingtonpost.com/sejal-hathi>.

or unemployed women may have less access to health care. Health care providers in states that have passed “religious discrimination laws” may deny services to lesbians, transwomen, pregnant unwed mothers, or women with STDs if their religion forbids them from doing so, restricting their access to care.

Passage of the Affordable Care Act (ACA, or “Obamacare”) in 2010 made some improvements to women's health care. It requires that all health insurance plans cover pregnancy, maternity, and newborn care; mental health and substance abuse services; preventive and wellness services, such as regular Pap smears and mammograms; and pediatric services. The law does not require plans to include hormones, therapies, or surgeries for transwomen seeking to transition. The ACA requires that all Americans have some form of health insurance and has led to more than half of the states expanding state Medicaid allotments to cover low-income residents, though a majority of states in the South and Midwest have not accepted additional Medicaid funds from the federal government. Gallup polls showed a steep decline in uninsured Americans because

of the ACA. As of 2015, nearly 11.9 percent of Americans remained uninsured (Levy 2015). After President Trump's administration made changes to the ACA, the number of uninsured persons rose to 11 percent in the second quarter of 2017 (Auter 2017). Despite major improvements toward health care coverage, gaps still exist. Currently, of all racial groups, Latinas and Native Americans are most likely to be uninsured.

The United States has the highest infant mortality rate of all industrialized nations, with a national average of 6.1 deaths per 1,000 live births (CDC 2011). The odds of an infant death increase with the onset of the child's first birthday (Agrawal 2015). Causes for infant death include serious birth defects, low birth weight, Sudden Infant Death Syndrome (SIDS), or injuries such as suffocation (CDC 2011). Economically disadvantaged mothers who do not have sufficient health coverage for prenatal care, child care, or nutrition for their infants and overcrowded, understaffed hospitals—or a lack of nearby medical care—contribute to this high infant mortality rate. African American and Native American women are more likely to experience the loss of an infant than other racial groups (Population Reference Bureau 2015). Washington, D.C., and Guam experience the highest rates of infant mortality among all U.S. states and possessions (Henry J. Kaiser Family Foundation “Infant” n.d.).

Maternal Health

Due to the ACA, all insurance plans in the United States must cover pregnancy, maternity, and newborn care. At the same time, not all insurance plans are flexible on their definitions of these types of care. While insurance plans will cover maternal health-related procedures that take place in a clinic or hospital with conventionally trained medical staff, they will not always cover natural childbirth, midwives, or doulas for mothers who would like to give birth at home.

The Centers for Disease Control and Prevention (CDC) has identified postpartum depression as one of the top three medical issues facing mothers. In a study of 17 states that screen new mothers for depression, up to 20 percent of mothers self-report postpartum depression, and more than half of these women had experienced depression prior to their pregnancies (CDC n.d.). The majority of pregnant women or new mothers either do not report depression symptoms or do not seek out treatment due to financial restraints or lack of self-awareness. The federal

government is taking steps to improve screening procedures and increase knowledge about this disorder.

Federal law recommends that insurance plans cover breastfeeding supplies. Great controversy exists over the benefits and drawbacks of breastfeeding. Not all mothers are physically capable of breastfeeding, nor do they have the facilities to do so if they work full-time outside of the home, away from their babies. The media has inflated the importance of breastfeeding to infant health, creating another source of anxiety for mothers. A wide variety of formulas exist, which may or may not be covered by health insurance.

Diseases and Disorders

The most common chronic health issues that American women experience are lung cancer, breast cancer, diabetes, obesity, osteoporosis, and depression. African American and Native American women are most at risk for early death from these medical conditions due to inadequate health care. As most of these health issues are comorbid with an autoimmune disorder, women who suffer from these health issues are likely to take more sick time at work or lose their jobs and file disability claims. Seventy-five percent of autoimmune disorders occur in women; they are the fourth most common cause of disability for women (American Autoimmune Related Disorder Association 2015). Women are more likely to identify as disabled than men, with African American and Native American women the most likely to identify as disabled. Lesbians and transwomen—particularly those of color—are at the highest risk for all common women's health issues, as they may put off preventive care appointments due to actual or perceived discrimination by health care providers.

Breast cancer is the most common cancer among women. Across the nation, people hold walkathons to raise money to find a cure for the disease, as well as shave-a-thons to make wigs for breast cancer patients. At the same time, women are more likely to die from lung cancer than breast cancer (USCS 2014). The third most common cancer among American women is colorectal cancer, which is primarily associated with men. While white women are most likely to receive a cancer diagnosis, African American women are most likely to die from cancer. Native American women have the lowest incidence of cancer, and Asian American women have the lowest death rates from cancer (CDC 2014a).

Twenty-five percent of Americans with HIV/AIDS are female. African American women make up the majority

of female HIV/AIDS carriers. The highest percentage of female HIV/AIDS victims are 25–44 years old, and the most likely to die are African American women. Many women contract HIV/AIDS through heterosexual contact and often do not know whether their sexual partner is HIV-positive. Even if they do know, they may submit to intercourse if they feel pressured or fear rejection from their partner. It is estimated that only 32 percent of women with HIV/AIDS have their illness under control (CDC 2015b). Cisgender heterosexual people still stigmatize HIV/AIDS and those who suffer from the disease. HIV-positive women may fear ostracization if they speak openly about their illness, which could cause them to forego treatment or support groups. As prostitution remains illegal, no government entity monitors the sexual health of prostitutes or provides treatment for their sexually transmitted diseases (STDs).

Women across racial groups are most likely to die from heart disease or cancer, while women of color—particularly Native American women—are more likely to die from “unintentional injuries” than white women (CDC 2015c).

Nearly two-thirds of Americans suffering from Alzheimer’s disease are women. Currently, there is no preventive measure, cure, or effective treatment for Alzheimer’s, a degenerative brain disease that renders people dependent on others for care and eventually leads to death. As female family members and female health care providers are most likely to provide care for Alzheimer’s patients, it is a women’s health issue. This disease places great psychological and emotional strain on caregivers as well as those who suffer from the disorder, and it will cost the United States billions of dollars in Medicare and Medicaid payments (Alzheimer’s Association 2015).

While women are less likely to commit suicide than men, they are three times more likely to attempt it (Schrijvers, Bollen, and Sabbe 2012). As women are more likely to suffer from chronic depression than men, it is possible that this disorder, when combined with alcohol or drug abuse, may lead them to suicide attempts. White and Native American women are more likely to attempt or commit suicide than other races; lesbians and transwomen of all racial groups are most at risk for suicide attempts.

Employment

Historically, American women, typically white and middle- or upper-class, were discouraged from working outside the home once they married and had children. Despite

this, many American women took in sewing or laundry or worked in kitchens, in private homes as domestics, or factories as sweatshop labor to make ends meet. During World War II, American women filled positions left open by men who went to war. Women discovered that they could perform technical work to supply the military with arms, vehicles, and ammunition. Women also assisted the war effort through scientific research and communications. When men returned from the war, they reclaimed STEM-related jobs, and many women were encouraged to return to full-time motherhood. Women of color continued to work outside the home to support their families, often in lower prestige, lower paid positions than those held during the war. During the 1960s, all civil rights movements inspired women to emancipate themselves through education and employment outside the home in whatever field interested them. Due to this movement, women have become more common in law enforcement, firefighting, management, and other male-dominated fields.

In 2013, out of 127.1 million working-age American women (16 years of age and older), 57 percent were in the labor force, compared to 70 percent of men (USDOL 2013). Of all racial groups, African American women of working age are most likely to be employed in some capacity and more likely to be employed full-time than women in any other racial group. Latinas and Asian American women are employed in similar percentages as white women. Native American women face the lowest employment rates of all racial groups (Austin 2013). Unmarried women with children are more likely to be in the labor force than married women with children.

The three industries with the largest percentage of total employed women are the education and health services industry (36.3%), the professional and business services industry (10.2%), and the leisure and hospitality industry (10.1%) (USDOL 2013). White non-Hispanic women are overrepresented in early childhood and elementary education, librarianship, nursing, speech therapy, and social work. White non-Hispanic men of Christian faiths still dominate government, the financial sector, and white-collar professions such as medicine, law, scientific research, and engineering, and they tend to hold the top positions in those fields. As of 2014, less than 5 percent of women are Fortune 500 CEOs (Warner 2014). Even in female-oriented medical fields such as obstetrics and gynecology, male physicians still outnumber female physicians. While the Equal Opportunity Act of 1972 and Executive Order 11246—commonly known as Affirmative Action—provide equal

employment opportunities for women and minorities, making it against the law to discriminate against women or minorities in employment recruitment, retention, and promotion processes, women remain underrepresented in STEM careers due to systemic bias.

Across all career fields, female-identified persons of all racial groups earn less money than men. The median weekly earnings for full-time, year-round female workers in 2012 was \$691 compared to \$854 for men. The median annual earnings for full-time, year-round female workers in 2012 was \$37,791 compared to men's \$49,398. Full-time working, married women enjoy the highest median weekly earnings, while never-married women earn the lowest median weekly earnings. Latinas receive the lowest median weekly earnings of all racial groups (USDOL 2013). Women are also more likely than men to take sick leave, vacation days, or personal days to care for their children, further reducing their pay and benefits.

American employers have historically paid women less than men, often under the assumption that women receive financial support from their husbands or to encourage women to marry in the first place. In 1963, President John F. Kennedy signed the Equal Pay Act (EPA) into law. A U.S. federal law amending the Fair Labor Standards Act, it intended to abolish wage disparity between the sexes. Female activists such as Dolores Huerta fought for equal pay for female farmworkers. While women's salaries have risen because of this law, the goals of EPA have not been completely achieved. Senator Hillary Rodham Clinton introduced the Paycheck Fairness Act in 2005, which stressed that discrepancies in wages for women and men must be job-related or serve a legitimate business interest. According to a 2007 Department of Labor study, men dominating blue-collar jobs often earn higher wages because their hourly overtime requires cash payments, while women comprise over half of the salaried white-collar management workforce, which is exempt from overtime laws. In 2009, President Barack Obama signed the Lilly Ledbetter Fair Pay Act into law, which allows women to file equal-pay lawsuits within 180 days of the employer's initial discriminatory wage decision.

Lesbians and transwomen are most at risk for employment discrimination. All faith-based institutions have the right to terminate the employment of women who come out or transition, regardless of state. Lesbians in committed relationships may or may not receive the same benefits as spouses in heterosexual relationships, even in states that have recently recognized same-sex marriage. Employer

health insurance plans may not cover hormone therapy or sex-reassignment surgeries for transwomen, which causes transgender employees greater financial burden than their cisgender peers.

As of 2015, most states do not prohibit discrimination against sexual orientation and gender identity. Six states prohibit discrimination against sexual orientation and gender identity for state employment. Seventeen states have no protection for LGBT employees in place. The Employment Non-Discrimination Act (ENDA), originally introduced to Congress in 1994, would prohibit discrimination in hiring and employment based on sexual orientation or gender identity. While the bill was passed in the Senate in 2013 and President Barack Obama signed an executive order in 2014 protecting some employees, Republican representatives blocked passage at the federal level, preventing protection for all.

Family Life Reproduction

Women are losing personal control over their reproductive organs. In 2014, in *Burwell v. Hobby Lobby*, the Supreme Court ruled that businesses have the right to not cover contraceptives in their insurance plans if it violates the business owner's religious beliefs. This means that women will have to pay more for birth control or and may skip it altogether if they cannot afford it. While the 1973 *Roe v. Wade* decision legalized abortion, since then, many states have enacted laws restricting access.

In 2014, 90 percent of all U.S. counties did not have an abortion clinic, and many states had laws restricting access, with exceptions, such as saving a woman's life (Guttmacher Institute 2017). In some states, the law mandates that parents must provide consent for abortions for minors. While birth rates are decreasing, the percentage of babies born to unmarried mothers is on the rise; statistics do not show whether these were planned pregnancies, accidents, or rapes. Some researchers point to the lack of appropriate sex education in schools, lack of access to contraceptives and birth control pills, and social pressure to conform to particular behaviors as the reasons for the rise in births to unmarried mothers. At the same time, this rise can also be attributed to more adult women choosing to remain single. This is especially the case for African American women, where a rising number identify as single. Also, more lesbians, whether single or in committed relationships, living in states that do not recognize same-sex marriage, are choosing to have children.

Sexuality

While the femininity of a girl in the United States is no longer challenged whether she wears pants or dresses, the 21st-century fashion industry provides few options for a girl who wants to provide a feminine, but modest, appearance. At younger ages, girls feel increased pressure to make their bodies fit into clothes that reveal their body shape. These clothes cause an increased level of stress to the girls who feel pressured to wear them to present a heterosexual feminine appearance to their peers.

Girls may or may not identify unwanted attempts at sex as sexual assault or rape; 68 percent of sexual assaults are not reported to the police (Rape, Abuse & Incest National Network 2009). Boys also receive no guidance in this area; 84 percent of men who commit rape do not identify what they did as rape (Curtis 1997). Seventy-five percent of girls report that the reason they have sex is because their boy-friends want it, regardless of whether or not they want it as well. Seventy-seven percent of teenage girls who have had sex wish they had waited, and 40 percent of teenage girls whose first intercourse took place at 13 or 14 years of age report that the sex was unwanted or involuntary (Gutt-macher Institute 2014). In recent times, male coaches of girls' teams have been implicated in sexual assault cases.

Researchers claim that girls are reaching menarche at younger ages than before and that they are developing secondary sex characteristics at younger ages than previous generations. This "early puberty" is also taking place among boys. Researchers speculate that hormones in dairy products and meat, plastics, stress, or different types of pollution could cause this early onset of puberty. Earlier onset of puberty will result in an earlier awareness of sexual urges. As each state and each school district has the freedom to decide how it will teach students about sex, and all parents have the freedom to decide how they will teach their children about sex (if at all), children in the United States are receiving unequal and uneven sex education.

Sex education is not required in all 50 states. More than half of the states require that schools provide sex education that discusses abstinence. Often, those states require that abstinence is stressed as the most effective "safe-sex" method. Research shows that abstinence-only programs can prevent teens from using contraceptives and actually increase their risk of unwanted pregnancies. States with comprehensive sex education programs that include information about condoms and birth control have the lowest teen pregnancy rates.

Women's Voices

Rocio Ortega

Rocio Ortega (1995–) became involved in Girl Up—a United Nations Foundation organization that gives American girls an opportunity to become global leaders—and began a Girl Up Club in her East Los Angeles high school to raise awareness and funds to support girls' education in Malawi, Ethiopia, and Guatemala. She was a Girl Up Teen Advisor (2011–2012) and is now a Youth Champion at Wellesley College. Also, through Girl Media, Ortega trains girls in leadership and broadcast journalism to give voice to global issues facing girls. She has worked on legislation in California, interned for Rep. Grace Napolitano, and served as a page in the U.S. House of Representatives. In 2012, Ortega received a Women to Watch Award from the political organization Running Start.

Although they are dropping, teenage pregnancy rates in the United States are among the highest among industrialized countries. The main rise in teenage pregnancy rates is among girls younger than 15 years old. Thirty-four percent of teenage girls in the United States have at least one pregnancy before they turn 20; 79 percent of teens who become pregnant are unmarried. Even though more schools are integrating day care programs and alternative high school programs for pregnant teens, only one-third of teenage mothers complete high school and receive diplomas. Only 1.5 percent of women who had a teenage pregnancy had completed a college degree by the time they reached 30 years of age (Gutt-macher Institute 2014). Girls of color, girls from rural communities, and girls from economically disadvantaged communities are the most likely to experience teenage pregnancy.

For the most part, sex education remains heteronormative. Safe sexual practices for LGBTIQ teens are rarely, if ever, addressed, even in higher education institutions. For this reason, bisexual, lesbian, and male-to-female transgender teens may engage in riskier sexual behavior than their heterosexual counterparts, with no knowledge of where to go for help if they do not live in urban areas with significant LGBTIQ community resources.

Marriage and Fertility

In the United States, marriage is a legal contract that has traditionally ensured that the wife and children receive legal and financial benefits and protections. American women have traditionally received pressure from their families, peers, and the media to date and get married. Now that same-sex marriage is recognized by the federal government, lesbians as well as heterosexual women may experience this pressure to marry and create families.

However, women today are less likely to marry than in previous generations. One reason that American women delay marriage is that they are spending more time on their educational and professional development. Another reason is that, if women are in relationships, they often wait until both partners have reached a certain level of financial stability prior to marriage. Marriage rates have decreased most sharply among African American women, who are more likely to be college-educated and employed than African American men.

American women who prioritize having children often marry younger than those who wish to pursue careers or other interests, but more women are choosing motherhood at later ages. While most couples have the option to take in foster children or adopt, state laws vary in terms of the adoption of foster children as well as what requirements a single person or couple must meet to adopt a child. In some states, lesbian couples may or may not be allowed to adopt children.

Household Roles and Responsibilities

The household roles and responsibilities of married American women vary by socioeconomic class and culture. Asian American and Latina wives may have to look after an extended family of their spouses' relatives as well as their own. Women on more modest budgets will have to do their own housecleaning, while women in more affluent positions will hire help. Particularly in the Southwest,

it has become customary for married white women—even if they are middle class—to hire Latina housekeepers, nannies, and gardeners. Women who can afford to do so may opt to homeschool their children if they do not agree with what is taught in the local schools for religious or political reasons.

Perhaps the major household role of the 21st-century American wife and mother is chauffeur. While others may provide child care, it is most often the mother who transports children back and forth to day care, school, after-school activities, sports, and playdates. Many mothers will perform all of these duties—child care, housecleaning, cooking, and taking care of their significant others—while working full-time. Despite all of this, American women often feel guilty that they cannot spend as much time as they would like with their children, and so they go above and beyond in certain areas to compensate, while continually feeling as if they are not doing enough. This phenomenon—“the Supermom complex”—has been cited multiple times in popular culture blogs and scholarly journal articles.

American women of younger generations with higher levels of education may expect their significant other to share the burden of housecleaning and child care. This is especially the case in relationships where the man is unemployed or working a job perceived as less important than the woman's.

Divorce

Approximately 70 percent of Americans identify as married, but only half of that population has only married once. Women are more likely than men to identify as married, and they more likely than men to identify as “married once.” Of all racial groups, white women are the most likely to divorce and remarry, and Asian American women are the least likely to divorce and remarry. Of all racial groups, women 55–64 years old are the most likely to have divorced and remarried (Lewis and Kreider 2015). Immigrant women are less likely to seek divorce or remarry than women born in the United States, and women from religious communities are less likely to divorce than nonaffiliated women. While little stigma is attached to divorce among U.S.-born Americans, statistics show that women who have divorced once are likely to divorce again.

Women may divorce their spouses for any reason in the United States. As more American women acquire higher

education and become financially independent, they do not need to depend on spouses for financial support. The most frequent reasons that American women seek divorce include escape from domestic abuse, rejection of infidelity, and midlife crises. If the couple has children, custody of the children traditionally goes to the mother, while the father will have visiting rights and must pay child support until the children are 18 years old.

A Williams Institute study shows that same-sex couples are less likely to divorce than heterosexual couples and that more lesbian couples marry than gay male couples. At the same time, multiple studies have shown that more lesbian couples divorce than gay male couples (Badgett and Herman 2011). This phenomenon may occur because there are more married lesbian couples than married gay male couples, but lesbians are more likely to marry their first love at a young age than gay men, who are more likely to have had multiple partners over time and may have more awareness of what qualities they seek in a life partner. Same-sex couples with children may try harder to make their relationships work for the sake of the children, especially in states where the nonbiological parent may lose all custody rights upon divorce.

Single Motherhood

While the number of infants born to unwed mothers is decreasing, they compose 40 percent of all births in the United States (CDC 2015a). Primarily due to personal choice or divorce, more women are raising one or more children without a spouse. Contrary to popular belief, two-thirds of single mothers are white, and one-third have a college degree (Single Mothers Guide 2015).

While they may receive assistance with child care or housing from parents, grandparents, other relatives, or close friends in the community in the same situation, not all single mothers are so fortunate. Single mothers earn significantly less than their married peers, and as much as 80 percent of a single mother's income can be eaten up by child care and housing costs. One-third of single-mother families are "food insecure," meaning that they might not have enough to eat. Living under these conditions, single-mother families are the poorest in the nation and the most vulnerable to homelessness. Eight out of ten homeless families are single-mother families (Single Mothers Guide 2015).

Lesbians may have biological children from former heterosexual marriages, foster children, or adopted

Millennium Development Goals

In 2000, the member states of the United Nations adopted eight international development goals to be achieved by 2015:

- eradicate extreme poverty and hunger
- achieve universal primary education
- promote gender equality and empower women
- reduce child mortality
- improve maternal health
- combat HIV/AIDS, malaria, and other diseases
- ensure environmental sustainability
- develop a global partnership for development

Some of these goals were met. Extreme poverty was reduced. More people gained access to clean drinking water. Boys and girls enrolled in school at similar rates. And women's participation in governing bodies increased.

But hunger, malnutrition, and maternal mortality have remained problems worldwide. Gender disparity still exists in girls' enrollment in secondary education in some parts of the world. Women's participation in the labor market is still lower than men's—among those who are available to work. And few women are heads of state.

The Millennium Development Goals led to a great deal of progress during the first 15 years of the 21st century, but work remains to be done.

United Nations. 2016. *Millennium Development Goals*. Retrieved from <http://www.un.org/millenniumgoals/2014%20MDG%20report/MDG%202014%20English%20web.pdf>.

children. In states where both lesbians in a couple may not automatically share joint custody of their children, those lesbians with children may also be identified as single mothers. Despite this, children living with the significant other long enough will recognize that person as another parent if the significant other plays an active role in the children's care.

Politics

In the United States, the fight for women's rights went hand in hand with the abolition of slavery and other

civil rights movements for people of color, LGBTIQ populations, and people with disabilities. Restricted access to education, employment, property ownership, legal services, and government left most American women dependent on their fathers, husbands, sons, or other male relatives. Men even had the power to send their wives, daughters, or female relatives to insane asylums, disowning them if they challenged their traditional female roles.

Suffrage

In 1807, white male suffrage was officially instated in the United States. Prior to 1807, women in New Jersey and some New England townships had the right to vote if they owned property. Little documentation exists on the response of these women who lost their right to vote. In 1848, New York social reformer and abolitionist Gerrit Smith included women's suffrage as part of the Liberty Party platform. In that same year, female abolitionist Quakers organized the Seneca Falls Convention, the first women's rights convention held in the United States. The convention addressed laws that discriminated against women, the role of women in society, and the right to vote. At this conference, abolitionist and women's suffragist Elizabeth Cady Stanton drafted the Declaration of Sentiments, modeled after the Declaration of Independence, demanding equality with men in law, education, employment, and suffrage. Women's right to vote was the most hotly debated topic in the document, even among female attendees. But abolitionist Frederick Douglass supported its inclusion, and the resolution was kept.

The Seneca Falls Convention kicked off a series of women's rights conventions across the Northern states. In 1866, Susan B. Anthony joined Stanton to form the American Equal Rights Association, an organization for white and black women and men fighting for universal suffrage. Fellow member, abolitionist, and women's rights activist Sojourner Truth advocated for black women's rights. While the Fourteenth Amendment gave African American men the vote in 1868, all women were still disenfranchised. In 1869, Stanton teamed up with Susan B. Anthony to form the National Woman Suffrage Association to achieve voting rights for women through a constitutional amendment. In that same year, Lucy Stone and Henry Blackwell formed the American Woman Suffrage Association to gain voting rights for women through amendments to state constitutions. Between 1893 and 1918, 16 states gave women the right to vote; in 1920, the federal government added the

Nineteenth Amendment to the U.S. Constitution giving all women the right to vote.

At the same time, male and female African Americans in the South were discouraged from voting through intelligence tests and intimidation tactics. During the civil rights movement, the Voting Act of 1965 was enacted to prohibit voter discrimination by race and ethnicity. In the 21st century, elderly women with restricted mobility may lose their chance to vote as well as those women who do not have state-issued identification, such as a driver's license. Despite such setbacks, more U.S. women are registered to vote than men, and female voters have outnumbered male voters in every presidential election since 1964 (National Women's Political Caucus 2010).

Rights

The most civil rights gains for American women occurred in the 1960s, during the second wave of feminist movements. In 1960, the federal Food and Drug Administration (FDA) approved the first birth control pill. After that, the federal government passed the Civil Rights Act of 1964, which prohibited discrimination against sex as well as race in hiring, promoting, and firing. Both of these events led to an increase in young women enrolling in higher education institutions and seeking employment outside the home. Legalization of the use of birth control for married couples (*Griswold v. Connecticut* 1965) and legalization of abortion within the first trimester (*Roe v. Wade* 1973) gave American women with education and skills more options on how to live their lives than before.

Participation in Government

Since 1980, in every presidential election, the proportion of eligible female adults who voted has exceeded the proportion of eligible male adults who voted (National Women's Political Caucus 2010). Since 1986, the proportion of eligible female adults who have voted has outnumbered the proportion of eligible male adults who have voted in all elections.

In the United States, women hold roughly one-third of all government positions but less than 20 percent of the seats in Congress. The makeup of the 115th U.S. Congress (2017–2019) was as follows:

- 105 female members out of 535 members, or 19.6 percent of Congress
- 21 female senators, or 21 percent (16 Democrats, 5 Republicans)

- 84 female representatives, or 19 percent (62 Democrats, 22 Republicans) and 5 female delegates (3 Democrats, 2 Republicans) representing Guam, the Virgin Islands, and Washington, D.C. (USDL 2013; CAWP 2016)

As of 2014, a woman has yet to hold the office of president or vice president of the United States. Activist women such as African American Shirley Chisholm, Japanese American Patsy Mink, Jewish American Bella Abzug, and Native American Winona LaDuke have all run for president on third-party tickets. Democrat Geraldine Ferraro, the running mate to presidential candidate Walter Mondale in 1984, was the first woman to run on a major party national ticket. While detractors believed that women's groups pressured Mondale to take on a female running mate, only 22 percent of women voters surveyed were positive about her selection. In 2008, Democrat Hillary Rodham Clinton was the first woman to run for president in the initial primaries, but she lost to the nation's first African American president, Barack Obama. In that same campaign year, Republican presidential candidate John McCain named former Alaska governor Sarah Palin to run as vice president, hoping to attract female voters.

Hillary Rodham Clinton was the first woman nominated to run for president on a major political party for the Democrats. She won the popular vote, with 48.2 percent, against the Republican nominee, Donald Trump, with 46.10 percent (Wasserman 2017). However, Trump received more Electoral College votes and was elected president. To protest Trump's antiwoman, Islamophobic, and anti-immigrant rhetoric, a national Women's March on Washington took place on January 21, 2017. The march was organized by an alliance of diverse women and was unified around ending violence against women and their bodies; reproductive freedom; LGBTQIA, workers', civil, immigrant, and disability rights; and environmental justice. Sister marches were held globally (Women's March. n.d.).

Sandra Day O'Connor was the first female Supreme Court justice. She was appointed during the Reagan administration in 1981 and retired in 2006. As of 2014, three women serve on the U.S. Supreme Court: Ruth Bader Ginsburg and Elena Kagan, both Jewish Americans, and Sonia Sotomayor, the first Latina.

Religious and Cultural Roles

Women are more likely to identify as religious than men. They perceive their place of worship as a center for

Women's Voices

Tatyana Fazlalizadeh

Tatyana Fazlalizadeh (1985–) grew up in Oklahoma City and studied at the University of the Arts in Philadelphia. She uses her art to protest the public harassment of women in city streets, an experience globally that makes women feel uncomfortable and unsafe. Beginning in fall 2012, Fazlalizadeh, an American of black and Iranian ethnicities, created street art in a series titled *Stop Telling Women to Smile*, which was inspired by women who shared their harassment experiences with her. From the first displays in her Brooklyn neighborhood, Fazlalizadeh has created a series of posters that will gradually include other women's portraits and travel to other cities. Through her protests, she seeks to speak directly to offenders by using women's portraits and the texts inspired by women's experiences of public harassment.

community as well as comfort. Some religious sects allow women, including lesbians and transwomen, to serve as pastors, ministers, or rabbis. Many women lead choirs, teach Sunday or Hebrew school, organize potlucks or catered events for religious gatherings, and lead fund-raising efforts. It is also common for women to serve as missionaries, either as teachers in religious schools overseas or as traveling door-to-door missionaries. Women may or may not enjoy equal rights within their religious community, as their religion may prescribe distinct roles for men and women.

While there are women who do not agree with the teachings of their religion or the political positions that their religious leaders support, few seek out alternatives. Secular humanist and atheist movements remain male-dominated, which sometimes creates an unsafe environment

for women. Young women—particularly bisexual, lesbian, and transgender women—often explore different religious paths and communities, which they perceive as supportive to women and nonheteronormative cultures. Women and the LGBTIQ community have played a major role in resurrecting pagan and Wiccan traditions, which support female leadership and egalitarian practices. At the same time, American women will often return to their religion of origin for their wedding ceremonies and the education of their children.

In secular life, some continue to perceive women as playing behind the scenes caretakers. While many women deviate from this role, the American public questions such figures as Oprah Winfrey, the self-made African American female celebrity and CEO who never married. Winfrey is a beloved talk show host and humanitarian who has educated mainstream Americans on a multitude of topics. However, people question her sexual orientation because she does not conform to the heteronormative female stereotype. Americans often express harsher criticism of popular female public figures than males if they are perceived as aggressive, unfashionable, or masculine.

Issues

Women in the Military

Prior to World War I, women who wanted to fight in the U.S. military had to disguise themselves as men. During World War I, the navy and Marine Corps were the first branches of the U.S. military to allow women to enlist, primarily as nurses. During World War II, the Coast Guard and the air force opened their doors to women. In 1973, when the U.S. government abolished conscription, the number of female recruits increased dramatically, and the military did its best to integrate them. It was not until the 1991 Persian Gulf War, however, that men and women served together in integrated units in a war zone overseas. Women performed multiple roles in Iraq and Afghanistan that were once limited to men. In 2013, based on a review of women's service in Iraq and Afghanistan, Defense Secretary Leon Panetta announced that women could serve in combat roles.

Today, approximately 17 percent of those serving in the U.S. military identify as women, and half are women of color (Patten and Parker 2011). More young women, particularly women of color, rural women, and women from economically disadvantaged communities are enlisting in the military in exchange for college tuition or job training that they might not receive in civilian environments. An

incentive for women to enlist is the decriminalization of pregnancy while in the service. Until 1976, women in the military could receive a dishonorable discharge for becoming pregnant while on duty. As it has become common for women to marry their significant others while on duty, the U.S. military now allows pregnant women to take leave to have their babies and then return to military service.

After World War II, openly LGBT people were explicitly forbidden to serve in the military. During the Clinton administration, gay men, bisexuals, and lesbians could serve in the military if they did not reveal their sexual orientation, according to a policy called "Don't Ask, Don't Tell." In 2011, gay men, bisexuals, and lesbians were allowed to serve openly after Congress passed, and President Barack Obama signed, the Don't Ask, Don't Tell Repeal Act of 2010. As of 2014, openly transgender people are forbidden to serve in the U.S. military, although quite a few have, such as Chelsea Manning.

Enlisted women are often victims of sexual assault, and their perpetrators may be comrades in their own units. For this reason, only a fraction of such cases are reported. Women in the U.S. military are more likely to suffer post-traumatic stress disorder (PTSD) from sexual assault than combat, and homeless female veterans were most likely to have experienced sexual assault during their service. More research is needed to determine how to maintain safe spaces and provide sexual harassment training in the U.S. military.

Domestic Violence and Sexual Assault

One in three women in the United States experience physical violence by an intimate partner within their lifetime. Intimate partner violence is most common among women between the ages of 18 and 34. One in five American women have experienced rape in their lifetime, and for 10 percent of these women, the rape was by their significant other (Bureau of Justice 2015). Women are more likely to be the victims of domestic violence and sexual assault than men. While emergency hotlines, special law enforcement units, and shelters with trained social workers exist to rescue and protect victims of domestic violence and sexual assault, a significant percentage of women do not report their partners. Often, women will tolerate this treatment out of fear that their significant other will leave them.

Domestic violence and sexual assault against women occurs across socioeconomic lines, racial and religious boundaries, and sexual orientations. Women who grew up in abusive families or communities where domestic

violence was accepted as a way of life may be more likely to accept abusive behavior from their significant others. The media erroneously depict the poor, women of color, and the wives of powerful men as victims. Women who defend themselves from their abusers, or murder them in self-defense, are more likely to go to prison than the abusers themselves. Higher education institutions in the United States are doing more to increase awareness of sexual assault and date rape among male and female college students, and they are encouraging young men to discourage male peers from mistreating women.

Sex Trafficking

Prostitution is illegal in all 50 states, with the exception of a few counties in Nevada. The Tenth Amendment of the U.S. Constitution gives each state the freedom to regulate, permit, or prohibit prostitution (also known as “commercial sex”) as they see fit, except when it crosses state lines as interstate commerce. The trafficking of women across state or international boundaries was first illegalized in the United States in 1910, under the Mann Act (also known as the “White-Slave Traffic Act”). In 1978, the Mann Act was amended to include child pornography and the kidnapping of children for sexual purposes, as most convictions have been related to child sexual abuse and the trafficking of children for sex. In 1986, the federal government made the language of the Mann Act gender neutral to recognize boys as victims of sex trafficking as well.

Not all prostitutes are victims of sex trafficking. Those who become prostitutes through sex trafficking are forced to do so against their will. Sex traffickers lure girls and women into the trade with affection, a feigned romantic relationship, or promises of a high-paying job. They may “import” women from other countries this way, by falsifying job offers as nannies or tutors. While the media leads many Americans to believe that all sex-trafficked women come from Eurasian countries, the majority of sex-trafficked women in the United States are permanent residents or U.S. citizens. In some parts of the country, due to the breakdown of their communities, Native American women and girls are most at risk of becoming sex-trafficking victims.

Uruguay

Overview of Country

Uruguay is located in the southeastern portion of South America and is bordered by Argentina, Brazil, the Uruguay River, and the Atlantic Ocean. Geographically, it is the second-smallest country in South America, with an approximate area of 68,036 square miles (176,215 sq. km). Rolling plains, low hills, and coastal land characterize the topography. The population was estimated to be 3,351,016 in July 2016. The capital and largest city is Montevideo. Most of the population lives in the southern part of the country.

Eighty percent of the population lives in urban areas, with about half of the total population in and near Montevideo. Ethnicity is predominantly white, 88 percent, and 8 percent of the population is mestizo and 4 percent are black. Roman Catholicism is the dominant religion, with 47.1 percent of the populace identifying as Roman Catholic. Of the remaining population, 23.2 percent identify as non-denominational, 17.2 percent as atheist or agnostic, 11.1 percent as non-Catholic Christians, 0.3 percent as Jewish, and 1.1 percent other. Spanish is the official language (CIA 2016).

It is thought that Uruguay was first inhabited by the Charrúa tribe of American Indians, composed of several groups of indigenous peoples. The Charrúas defended their land from attacks by the Spanish, English, Portuguese, and Brazilians over a period of 200 years. There was a large massacre in 1831 in which 40 Charrúa tribe members died and 300 were imprisoned. Some prisoners escaped, and European inhabitants enslaved those who remained. Over time, the Charrúa who remained in Uruguay mixed with the white inhabitants, and the Charrúa as a tribe disappeared and, with it, its culture. Today, it is estimated that there are between 160,000 and 300,000 descendants of Charrúa living in Uruguay and nearby countries (Alayón 2011).

Uruguay declared its independence from Brazil in 1825 and officially became a free country in 1828. It grew and prospered in the early 1900s under President José Batlle y Ordóñez (1856–1929). He formed many state institutions, including a state electric power company, a nationalized savings and loan institution, a mortgage bank, a state railway, and institutes for exploring coal, hydrocarbon, chemicals, and fisheries. He also passed social legislation aimed at protecting workers' rights, expanded state education, and furthered the separation of church and state. These reforms came to be known as "Batllism" (Hudson and Meditz 1990).

Up until the 1960s, Uruguay was one of the most educated and economically stable countries in South America. Starting in the 1950s and continuing into the 1970s, the economy collapsed, and Uruguay suffered financial instability. The country fell into further decline with the rise and control of a military government during the 1970s and 1980s. It is not often talked about, but the time of military rule was marked by widespread poverty, a weakening of the social structure, and the repression of human rights. Freedom of the press was severely restricted as were party politics. People were fired from their jobs, jailed, tortured,

and killed for suspected activity against the military regime. In addition, approximately 10 percent of the country's population left Uruguay to escape the military dictatorship and economic ruin (Hudson and Meditz 1990).

Although democracy was restored in 1985 and the economy improved, poverty levels remained high. Economic gains were short-lived, and the country suffered another economic crisis in 2002. It is estimated that close to 40 percent of the population lived in poverty during the early 2000s (UNFPA 2016).

During their presidencies, President Vázquez (2005–2010; 2015–present) and President Mujica (2010–2015) helped restore Uruguay to its former democratic and economic stability. Both adopted economic policies that encouraged business and investments with foreign countries, in conjunction with growing domestic business in new areas, such as wind power (Jordan 2016).

Overview of Women's Lives

Women in Uruguay have achieved a notable level of human rights and parity with men in many areas, such as reproductive rights, same-sex marriage, education, and workforce participation. However, women's rights and equality still lag in political participation, recognition and prosecution of domestic violence, and economic and education equality for women of color.

Women have equal or better human development compared to men, as shown by the Gender Development Index (GDI), which is above 1.0. Uruguay stands out in this respect, as there is only one other country in Latin America and only 13 other countries in the world that have a GDI above 1.0 (Constantine 2015).

The Gender Inequality Index (GII) for Uruguay was 0.313 in 2014, which placed it at 61st out of 155 countries. The GII is based on inequality in the areas of reproductive health, empowerment, and economic activity. Reproductive health is measured by the number of mothers who die due to pregnancy-related issues and the number of children birthed by adolescents. In Uruguay, for every 1,000 live births, 14 women die due to pregnancy-related issues, and for every 1,000 adolescents (ages 15–19), there are 58.3 births. Empowerment specifically refers to women's representation in government and participation in education at a secondary level or higher. Uruguayan women hold 11.5 percent of the seats in Parliament, and 54.4 percent of adult women have attained a secondary or higher level of education. Economic activity references participation in

the workforce; 55.6 percent of Uruguayan women participate in the workforce (UNDP 2015).

Girls and Teens

Uruguayan youth are relatively healthy and educated. Education is provided to all children free of charge, and almost all children attend elementary school. The mortality rate for children under five years of age is 9 percent, and 73 percent of children live above the poverty line (Fau 2011).

Although the majority of children are healthy and safe, approximately 300,000 children live in poverty. Their economic struggles affect their access to health care and their education. Poor children tend to drop out of school, even though it is free. They often leave school to work and help provide financial support for their families. About 8 percent of children between the ages of 8 and 14 work, often in unsafe and unsanitary conditions. Young children who leave school to work are typically engaged in begging, selling goods in the streets, and collecting garbage (Fau 2011). A large number of children work as domestic help. A survey of domestic service workers found that 34 percent had begun working prior to the age of 14 (Kaushik 2007).

Girls have fairly equal educational rights and opportunities as boys. By 1970, almost half of all students were girls (Hudson and Meditz 1990). Ninety-nine percent of both girls and boys attend elementary school, but girls attend secondary and higher education at a greater rate and longer than boys. In general, girls attend school longer than boys, 17 years compared to 14 years for boys (CIA 2016). As of 2015, 76 percent of girls attend secondary school, whereas 68 percent of boys attend secondary level. The divide is even greater at higher levels: 80 percent of girls enroll at the tertiary level, whereas only 47 percent of boys attend higher education (WEF 2016).

The primary causes of death in teenagers are traffic accidents, suicides, and homicides. More boys than girls die due to these causes, with 80 percent of teen deaths involving boys (PAHO 2012, 215).

National Education on Sexuality

Sexuality education was introduced into the general education curriculum in 2005. A curriculum was developed, and teachers were trained on the new content. A sexuality curriculum was backed by several international organizations as well as adjoining South American countries. It was agreed among the organizations and countries that sexual

education should be a part of all levels of education, that it should include education regarding prevention of HIV and AIDS, and that education departments should be allocated money to carry out sexual education initiatives. Although Uruguay was successful in implementing and integrating a sexuality education program, new political leaders halted the program in 2010. Education officials suggested that schools focus on violence prevention and the need for health care. In addition, the government mandated that schools focus on employment training. As a result, sexuality education became a low priority (DeJong 2014).

The UN Population Fund is working with the Uruguayan government to develop a plan to reimplement a comprehensive sexuality education program and to increase the availability and use of sexual and reproductive services by adolescents (UNFPA 2016).

Digital Divide

The economic crisis of 2002–2003 severely affected teenagers. Half of the teenage population lacked basic living necessities, according to a 2004 census. Another noticeable impact of the economic crisis was the lack of access to electronic resources and digital information. In response to this digital divide, the government developed a Digital Agenda 2011–2015. The Digital Agenda had a lofty goal to equalize access to information resources across the country. In addition, the government formed the Plan Ceibal, an initiative aimed at providing one laptop per child in all primary and secondary schools. By 2012, technology usage had increased dramatically, with 50 percent of teens aged 12–19 using Facebook; 30 percent of those teens belonged to low-income households (Sabelli et al. 2014, 96, 104–105).

Researchers found that access alone did not necessarily prompt teens' technology use. Researchers disseminated health information to teenagers living in low-income neighborhoods. Their study found that teens had access to and used cell phones more than computers and that teens were more likely to access health information if it was presented in a format they were used to, such as text messaging, games, and video. An engaging format proved to be instrumental in increasing technology usage for health education (Sabelli et al. 2014, 96, 104–105).

Education

Uruguay provides free schooling for its people, from primary through university level (CIA 2016). The centralized

nationwide educational system is modeled after the French system. There are three levels: primary, secondary, and university. The primary level is mandatory and consists of six years of instruction. Secondary level is also six years, but it is divided into two three-year cycles. The first cycle is mandatory; the second cycle is not, but it is intended to prepare students for university (Hudson and Meditz 1990).

In 2009, there were 2,556 primary schools. Approximately 16 percent of those were private. There were approximately 682 lower secondary schools, of which 182 were private. Sixty-one schools located outside of the capital of Montevideo offer a basic education course for people living in rural areas. There were approximately 663 upper secondary schools, with 182 of those private. For tertiary or university-level learning, there is one main public university, the Universidad de la República, located in Montevideo. Tuition is free for Uruguayans. In addition to the public university, there are a few private universities, also located in Montevideo: Universidad Católica del Uruguay Dámaso Antonio Larrañaga, ORT Uruguay, Universidad de Montevideo, and Instituto Universitario Autónomo del Sur. Other options for higher education include a small number of colleges and institutes that offer vocational training (Bacsich 2013).

The literacy rate for girls and women is very high at 99 percent. This high rate goes back to the early 1900s, when a “feminine section” was created to encourage women to attend the University of the Republic (Hudson and Meditz 1990). As of 2015, almost all girls attend primary school, 76 percent attend secondary school, and 80 percent attain a third-level (university-level) education. Of university-level students who graduate in a STEM field, 44 percent are women, and 56 percent are men. Women have surpassed men in the pursuit of a PhD; 59 percent of PhD graduates are women, whereas only 41 percent are men (WEF 2016).

Health

Access to Health Care

In the early 2000s, Uruguay made efforts to provide better and more equitable health services to its people. From 2004 to 2008, the government increased its spending on health care by 23 percent. By 2008, it was spending 7.5 percent of its gross domestic product (GDP) on health care. From 2008 to 2013, health care spending increased, but to a lesser degree, from 7.5 percent to 8.8 percent of its GDP. In 2008, Uruguay started the process toward universal health

care and insurance. The initiative aimed to lessen the gap between the public and private per-person expenditures in an effort to make the provision of health services more equitable among its citizens (PAHO 2012).

In 2009, there were 2.9 physicians per 1,000 residents. Even though Uruguay has worked toward universal health care, there is still a bias toward private health care, with 19,791 physicians working in the private sector and 5,948 working in the public sector. As a majority of the population is located in the capital and larger cities, the concentration of health facilities are also located in the cities. In 1980, 60 percent of the total public hospital beds were located in Montevideo. It is estimated that there were 9,089 public hospital beds in Uruguay in 1980. In 2010, there were 1.2 hospital beds per 1,000 people (PAHO 2012).

Maternal Health

The state health system gives women the opportunity to access full health care when pregnant and giving birth. As a result, in 2012, 99 percent of births were attended by a skilled health professional. Women were given 12 weeks of maternity leave and were paid 100 percent of their wages during leave (WHO 2016b). Women working in both the public and private sectors receive maternity leave wages. In addition, domestic workers receive maternity benefits (SIGI 2016). At 98 percent, a majority of children are breastfed for some period; 43 percent are still breastfed at one year and 28 percent at age two. Fifty-seven percent of children are exclusively breastfed when under six months of age (WHO 2016b).

History of Legalization of Abortion

The legalization of abortion was, and remains, controversial. Prior to 2012, abortion was illegal. Even though abortion was illegal, women still sought out and obtained abortions. There were no laws regulating the procedure, resulting in unsafe abortions, injury, and even death. In addition, contraception was not widely available, and there was little education regarding sexual and reproductive health (Briozzo 2016).

In 2001, health professionals banded together to develop a plan for risk reduction due to unsafe abortions. At the same time, women's rights organizations along with liberal government leaders worked toward advancing women's sexual and reproductive rights (Briozzo 2016).

Abortion was legalized in 2012, but only after intense political negotiation. The law allowing abortion is complex

and includes several limiting provisions, such as a prohibition on private, for-profit clinics performing abortions; a requirement that woman seeking an abortion must meet with a team that monitors the abortion; and a five-day waiting period after meeting with the team before obtaining the abortion. After legalization, abortion became a valid health issue, and safe abortions became available under the national health system. Maternal mortality rates decreased as a direct result of the legalization of abortion. In addition, an interesting side effect that occurred alongside lower maternal mortality was lower abortion rates. This is attributed to the increase in education around sexual and reproductive health and the widespread availability of contraception (Briozzo 2016).

The commitment of health professionals to provide fair and just reproductive health options is the most noteworthy aspect of the Uruguayan approach to women's reproductive rights (Briozzo 2016). While health professionals are committed to providing comprehensive health care, 30 percent of gynecologists do not perform abortions under a conscientious objector provision that allows gynecologists to refuse to perform abortions due to religious beliefs. This right to conscientious objection was recently upheld by an administrative court, leaving some to question whether the government will be effective in providing legalized abortion, depending on the number of physician objectors (Coppola et al. 2016, S16–S19).

Diseases and Disorders

Overall, the health of the population of Uruguay has improved since 2000, leading to a higher life expectancy, which was 76 years in 2009 and 80 years in 2010 for women. The World Health Organization (WHO) has shown that the incidence of death due to cardiovascular disease has declined from 2000 to 2012. Death from other noncommunicable diseases has also decreased during the same period (WHO 2014).

Women tend to live longer than men. The life expectancy for women was 80 versus 73 for men in 2015 (WHO 2017). Women use less tobacco and alcohol and are less likely to have high blood pressure. Only 19.4 percent of women smoked in 2014, compared to 26.7 percent of men. The per capita consumption of alcohol in liters for women was 4.2, whereas it was almost triple for men at 11.3, as measured in 2010. In 2008, 31 percent of women were shown to have raised blood pressure compared to 39.9 percent of men (WHO 2014). Although they consume

significantly less tobacco and alcohol, women do have a higher obesity rate. In 2014, 31 percent of women were identified as obese, compared to 22 percent of men (WHO 2014).

Communicable diseases are not prevalent in Uruguay; a vaccination policy has kept most communicable diseases at bay. Vaccinations are required, and there is no charge for immunizations. Ninety-five percent of the population receives immunizations. This program and the high rate of participation has proven successful, with no cases of measles, no cases of rubella, and only a few cases of hepatitis B reported (PAHO 2012). The incidence of HIV/AIDS is also low. A mortality rate of 5.1 deaths per 100,000 people was reported in 2009 (PAHO 2012).

The biggest threat to health is heart disease. Cardiovascular diseases caused 30 percent of deaths in 2009. The medical system does little to monitor and track hypertension. About 35 percent of the population does not exercise, 85 percent do not eat the recommended amounts of fruit and vegetables, and about 25 percent of the population smoke. A health model centered on the encouragement of good health and the prevention of disease was being developed in 2012, and it is hoped this model will help decrease the prevalence of heart disease (PAHO 2012).

Tobacco

Tobacco use is not unusual in Uruguay, but the government is trying to change that. During his presidency in the mid-2000s, President Vázquez (an oncologist who continued his oncology practice during his presidency) banned public smoking. In addition, he required cigarette companies to enlarge the health warnings on cigarette packs. He also imposed draconian taxes on the sale of cigarettes—the tax on one pack of cigarettes comprised two-thirds of its price. Vázquez's measures worked. The number of adult cigarette smokers declined from 32 percent to 22 percent in the period 2006–2013. The number of people admitted to hospitals for smoking-related ailments also fell during the same period. The government won a major victory when the International Center for Settlement of Investment Disputes, an arbitration court run by the World Bank, ruled that Uruguay was not violating fair trade rules with its strict antismoking campaign, as the cigarette producer Philip Morris alleged. The court ruled that Uruguay could continue its antismoking campaign and ordered Philip Morris to pay Uruguay USD\$7 million in legal fees (Margolis 2016).

Employment

Approximately 55 percent of women participate in the workforce, compared to 76 percent of men. Women make up a disproportionate number of domestic positions at 18 percent versus 1 percent for men. Women also spend a disproportionate amount of time doing unpaid work, 309 minutes a day compared to men's 133 minutes per day.

Discrimination against gender in the workplace is prohibited; however, there is no specific provision requiring that women's pay is equal to men's for the same work. As a result, women earn less than men, even though they typically attain a higher educational level than men (UNDP 2015).

Family Life

Uruguay has a long history of advancing women's rights; yet, women are still working toward achieving equality. One of the first measures aimed at giving women equality was a 1913 divorce law that allowed women to unilaterally apply for a divorce without a husband's permission. In comparison, Chile did not legalize divorce until 2004 (Goni 2016).

In 2013, two significant reforms affecting women were passed under the Marriage Equality Law. The first change, affecting adolescent girls, was the raising of the legal age of marriage to 16. While 16 is still considered young, Human Rights Watch (HRW) advocates for all countries to adopt 18 as the minimum marriage age. Prior to the Marriage Equality Law, the legal minimum marriage age for girls was 12. The second reform was the legalization of gay marriage (HRW 2013).

LGBTI Rights

Gay rights have slowly increased and strengthened since 2003, making Uruguay one of the most gay-friendly countries in the world. Several laws aimed at protecting the rights of lesbian, gay, bisexual, transgender, and intersex (LGBTI) people have been enacted since 2003. The government enacted legislation prohibiting discrimination based on sexual orientation in 2004. Legislation legalizing civil unions was passed in 2007. In 2009, legislation making adoptions by gay couples legal was passed. That same year, President Vázquez lifted a ban on gays serving in the military (Equaldex 2016). Also in 2009, the government passed legislation allowing transsexuals to change their identity documents to reflect the gender of their choice

(BBC 2009). In 2013, same-sex marriage was legalized (Equaldex 2016).

Helping to advance gay rights are several civil rights groups. One group, Ovejas Negras (Black Sheep), works to promote and protect the rights of LGBT persons. Michelle Suárez Bértora (1983–), Uruguay's first transgender person to graduate from law school, helped draft both the marriage- and adoption-equality laws. Gay rights groups, such as Ovejas Negras, recognized the intersectionality among human rights groups and that people could be discriminated against for being gay and black or gay and poor. Gay rights groups began to collaborate with other civil rights groups to gain greater political power and work toward equality for all disenfranchised people. Toward that end, the gay rights parade became the diversity parade and grew in attendance from 300 in the 1990s to over 30,000 in 2013 (Cariboni 2014a).

Even though the government has supported extensive gay rights, there is still some public resistance. It is reported that 31 percent of Uruguayans oppose gay marriage (*The Economist* 2015b). Almost half of all gay people have indicated that they have experienced some sort of violence because of their gender identity. Hate crimes against LGBTI people have included harassment, threats, sexual violence, and even murder. In 2012 alone, five transgender women were murdered (Colectivo Ovejas Negras 2013).

Gender Violence and Femicide

Although women in Uruguay enjoy fairly equal rights to men, there has been and remains today a culture of violence against women. Domestic violence did not become a crime until 1995, when it was added to the penal code. In 1996, Uruguay ratified the Inter-American Convention on the Prevention, Punishment and Eradication of Violence against Women and with the ratification adopted its definition of gender-based violence, which included “physical, sexual, or psychological violence that occurs within the family or domestic unit or within any other interpersonal relationship” (Refworld 2011). In 2002, Uruguay passed its own domestic violence law aimed at the prevention, early detection, treatment, and eradication of domestic violence. Even with these measures in place, there was still a gap—the laws did not clarify whether sexual crimes that occurred within a marriage constituted domestic violence. This ambivalence of the wording in the legislation results in many domestic violence crimes being left unprosecuted. In addition, there is a culture of preserving the family unit

over punishing the perpetrator. Victims are often encouraged to reconcile and remain with their abusers, perpetuating the domestic violence cycle (Refworld 2011).

The movement to end violence against women took a giant leap forward in April 2016, when new legislation aiming to end gender violence was introduced. The legislation changes criminal law to better address violent crimes against women, creates a system-wide coordinated response to gender violence, and adds special courts to hear domestic violence cases. In addition, the legislation includes sections that address violence toward children, teens, the disabled, and elderly women (UN Women 2016).

Femicide is also reported as a problem in Uruguay. In 2011, 20 women were killed by their husband or partner (SIGI 2016). The government has responded by introducing legislation to include femicide as a specific crime under its penal code (WPR 2015).

Politics

Uruguay is one of the world's 20 “full democracies,” and the only “full democracy” in Latin America, according to *The Economist's* 2015 index. There is no exact definition of *democracy*, but the Economist Intelligence Unit attempts to formulate a definition of democracy by looking at six criteria. The criteria include access to voting polls, electoral process and pluralism, civil liberties, functionality of the government, political participation, and political culture. In looking at Uruguay, *The Economist* rated it a “full democracy” based on its democratic voting system; freedom of speech, religion, and other individual rights; its high-functioning government; and its democratic political culture. Its public participation in politics is low. However, since the other categories scored high, it still qualified as a “full democracy” (America's Quarterly 2015; *The Economist* 2015a).

There are three main political parties in Uruguay: Frente Amplio (FA, Broad Front); Partido Nacional or Blancos (National Party or White Party); and the Colorado Party (sometimes called the Scarlet or Red Party). The Broad Front party is a coalition of several liberal parties. The National Party is a right-wing conservative political party. The Colorado Party is an urban progressive party. Dr. Tabaré Vázquez was elected president in 2015. A member of the Frente Amplio political party, Vázquez previously served as president from 2005 to 2010. He won over half of the vote, earning 56.5 percent. The runner-up, Luis Alberto LaCalle Pou, of the National Party, garnered 43.4 percent

of the vote. His win continues governance by the Frente Amplio party that began in 2005 (CIA 2016).

In addition to the destruction of the Charrúa people, another blemish in Uruguay's political history is the impunity given to the military dictators who committed human rights crimes, including violence against women, during their control of the government. One-third of political prisoners under the dictatorship were women who were imprisoned for protesting against the inflation, unemployment and government corruption of the time. Women were insulted, stripped naked, prodded, groped, and raped while in prison (Devine 2016). A law passed in 1986 granted amnesty to those involved in the military dictatorship, resulting in victims and relatives of victims going unrecognized and uncompensated. In 2011, the amnesty law was overturned; however, resolution and justice has been slow and practically nonexistent. One report showed that of 256 pending criminal cases, only 2 percent had been resolved (Lessa 2015). In the few cases that have been heard, none have recognized the sexual violence crimes against women, even after women testified in court about these such crimes (Devine 2016). To jump-start the process toward justice, President Vázquez formed the Truth and Justice working group and tasked it with investigating human rights violations and monitoring the progress of the criminal cases (Lessa 2015).

Women in Politics

Arguably the most instrumental woman in advancing women's rights in Uruguay was Paulina Luisi (1875–1950). Luisi was the first female physician in Uruguay, and, coincidentally, her sister was the first female attorney in Uruguay. As a physician, Luisi was an advocate for sex education and contraception. Her ideas were not widely accepted at the time, but she managed to introduce sex education classes into the Uruguayan public school curriculum in 1944. Luisi also became involved in broader women's issues, such as the right to vote, organizing labor movements, and pushing for equal pay for women (Ehrick 1998). Partly due to Luisi's advocacy work, women were granted the right to vote in 1932 (IPU 2015).

Not only did Luisi have a great influence on women's rights in Uruguay, but her influence also reached an international audience. She was the only Latin American leader of the International Women's Suffrage Alliance (IWSA, later known as the International Alliance of Women, IWA). She traveled to Europe often to participate in the IWSA

conferences and corresponded regularly with other women's rights leaders around the world (Ehrick 1998). Since the early 2000s, the progression of women's rights has focused on legalization of abortion and same-sex marriage.

Women continue to strive for equality in a society still controlled by men. Women's representation in government positions has not yet reached parity. In 2015, only 9 of the 30 senators were women. Of the representatives, 17 of 99 were women, and the 13-member cabinet had 5 women. Around the country, there was only 1 female mayor (U.S. Department of State 2015a).

To guarantee more women in political positions, Uruguay passed a gender-equality law that required women to comprise one-third of candidate lists by 2014. Under this quota law, women must be named in every third place on the list. The law was meant to circumvent women being placed at the bottom of candidate lists (Freedom House 2015). In theory, the gender-equality law is meant to increase the number of women holding seats in the legislature. In practice, the law ensures that women appear on the candidate lists from which candidates are elected to parliamentary positions. In 2014, of all the candidate lists, women were listed as the first candidate on only two. On the remaining lists, women were consistently listed third, though this did not result in their being elected. Candidates are elected in proportion to the number of votes his or her party receives. Typically, the number of votes has not been numerous enough to get past the first or second candidate on each list; thus, only the men at the top of the list were elected (Cariboni 2014b).

Religious and Cultural Roles

There is freedom of religion in Uruguay and an official separation of church and state. Even with religious freedom and the existence of many religious groups, Uruguay is primarily a secular country. This extends to religious holidays, which are celebrated as secular days: Christmas is known as Family Day, and Easter Week is known as Tourism Week (Goni 2016).

Even though approximately 47 percent of Uruguayans identify as Catholic, many do not attend church. Only 7 percent of Catholics say religion is very important in their lives and attend services weekly (Lipka 2014).

Religious education is not allowed in the public schools. Schools are closed on major Christian holidays, and students are allowed to miss school on their particular religious holidays. Religious and government leaders report

a high level of tolerance among society members. In 2015, the Board for Interreligious Dialogue held its sixth annual celebration of the International Day of Peace, during which participants promoted the respect and understanding of all religions (U.S. Department of State 2015b).

Issues

Violence against Children

Violence against children in the home is reported as prevalent. Research in 2009 showed that 8 out of 10 adults used violence to discipline or correct a child (UNICEF 2011). In an effort to curb violence against children, the government sponsored campaigns against child abuse. In 2007, the government repealed the standing law that allowed parents to use physical punishment when correcting their children. A new law was passed that specifically banned corporal punishment and any other form of humiliating punishment against children (Global Initiative to End All Corporal Punishment of Children 2016). The legislation also provided for education of nonviolent forms of discipline for parents and other caregivers (UNICEF 2011).

Legalization of Marijuana

President Mujica approved the legalization of the production, sale, and use of marijuana in 2013. The regulations allow any citizen or legal permanent resident over the age of 18 to purchase up to 10 grams of cannabis per week from a licensed pharmacy. Although a prescription is not required for the purchase of cannabis, buyers must register with a government regulatory organization, the Institute for Regulation and Control of Cannabis (IRCCA). Individuals may grow up to six plants at home as long as the plants are registered with the IRCCA. In part, the law aims to undermine the black market trade of cannabis. To aid in this objective, the government regulates the pricing of cannabis sold in pharmacies (Romero 2013).

Uruguay did not pass the cannabis law to create a lucrative commercial market but rather to promote public health. Thus, advertising of marijuana is prohibited, as is the promotion of use of marijuana at events. In addition, the law restricts the sale of cannabis to citizens and legal permanent residents of Uruguay in an effort to prevent drug tourism. There is a zero-tolerance policy on driving under the influence of marijuana. Taxes on the sale of cannabis are minimal. Public health clinics are tasked with

developing strategies to treat people with cannabis addictions and schools with educating children on the dangers of using it (Walsh and Ramsey 2016).

There is hope that legalization of marijuana will directly benefit women in several ways. Drug cartel traffickers have increasingly recruited women to be “mules,” or couriers, to transport drugs. Often poor, uneducated women are targeted to transport small amounts of drugs across borders. The women are often single mothers who need the money to support themselves and their children. Transporting illegal drugs across borders is risky, and the women are often caught. Due to strict mandatory minimum sentences for drug offenses, these women end up in prison for nonviolent minor drug offenses. Their cycle of poverty is extended and exacerbated by their imprisonment. In addition, their children are left orphaned. With cannabis legalization, Uruguay is hoping to see a decrease in illegal drug trafficking in general and, as a result, a decrease of women being recruited to traffic illegal drugs. In addition, Uruguay has begun to look at drug policies more broadly, with the intention to integrate human rights and women’s rights into existing drug and prison policies (IRIN 2014).

The cannabis law is relatively new, and it remains to be seen whether it will be implemented with success. The law was passed with President Mujica’s full support. However, his successor, President Vázquez, is not as enthusiastic. In addition, polls consistently show public support below 50 percent. Uruguay may also face international pressure against the law. Uruguay’s neighboring countries of Argentina and Brazil do not have laws legalizing marijuana, and they have criticized Uruguay’s legalization of marijuana (Walsh and Ramsey 2016).

Trafficking

Uruguay is designated as a Tier 2 country for trafficking. Tier 2 is a designation given by the U.S. Department of State that signifies that a country is taking meaningful steps toward meeting with the U.S. Trafficking and Victims Protection Act’s minimum standards but does not fully comply with them (U.S. Department of State 2016).

Both sex and forced labor trafficking have been uncovered in Uruguay. Women and girls have been forced into sex trafficking in Uruguay as well as forced into prostitution in other countries such as Argentina, Brazil, Spain, and Italy. In addition, women from other countries, primarily the Dominican Republic, have been trafficked into

Uruguay for the sex trade. Workers have been trafficked from many countries, including Bolivia, Paraguay, Brazil, the Dominican Republic, and Argentina. Forced labor is seen in many industries, including domestic service, construction, wholesale stores, textile, agriculture, commercial fishing, and lumber processing. Uruguay also serves as a through country, with persons being trafficked from China and the Dominican Republic, through Uruguay, and ending in Argentina's forced labor and sex trade (U.S. Department of State 2016).

Currently, only transnational trafficking is prohibited under Uruguayan law. Domestic sex trafficking can be penalized under sexual exploitation or pimping laws; however, the penalties are not as severe as may be appropriate. For example, a transnational trafficking conviction can incur 4–16 years in prison, whereas a charge for sexual exploitation or pimping can incur a lesser sentence and can be reduced to community service or even a fine (U.S. Department of State 2016).

The government is taking steps to raise awareness around the existence and prevention of trafficking. It trained law enforcement and immigration officials on procedures for detecting, investigating, and responding to trafficking. It ran sex trafficking prevention educational campaigns near the borders of Argentina and Brazil and targeted the commercial sex trade by asking those in the travel and hotel industries to report suspicious and illegal activity (U.S. Department of State 2016).

Immigration and Refugees

Like many countries in the Americas, Uruguay was built by immigrants. Approximately 600,000 immigrants from Spain and Italy arrived and settled Uruguay from 1860 to 1920. There were no major immigration waves after 1920. However, smaller numbers of people from Peru and Middle Eastern countries have arrived and settled in Uruguay. Today, Uruguay has a very open and generous immigration policy (*Panam Post* 2015).

In addition to welcoming immigrants, Uruguay has also recently accepted refugees. In response to the ongoing Syrian refugee crisis caused by over five years of continual civil war, Uruguay opened its doors to 42 Syrian refugees in 2014. It was set to accept 72 additional Syrian refugees in early 2015, but due to public uncertainty about the ability of the Syrians to assimilate into Uruguayan culture, resettlement for additional refugees was delayed (*Panam Post* 2015).

History of Afro-Uruguayans

Uruguay is often considered a white country. In 1996, 93 percent of its population self-identified as white. Forgotten is its black history that began with the slave trade. With its capital city located on the Atlantic Ocean, Uruguay became a central port of entry for the slave trade in South America. While many blacks ended up in Argentina, some 20,000 remained in Uruguay. It is estimated that, by 1800, 25 percent of Uruguay's population was African. Free and enslaved blacks served in its different wars, and slavery was eventually abolished in 1842. After abolition, the black population pushed for equal rights under the constitution, which guaranteed equal rights for all. Although equal rights were guaranteed in theory, in practice, black people experienced pervasive discrimination and racial prejudice. In an attempt to advance their cause for equality, blacks founded at least 25 newspapers and magazines. In addition, blacks formed many civic and social clubs and organizations, including a black political party in 1936, the Partido Autóctono Negro (PAN, Indigenous Black Party). Although the government did not restrict political freedom (similar black political parties were outlawed in Brazil and Cuba), PAN disbanded on its own in 1944 due to low support (Andrews 2007–2015).

Black women in particular suffer from discrimination, a double discrimination, from being a woman in a male-centered society and from race-based prejudice. As late as 1993, 75 percent of black women worked as maids. A 1999 study revealed that the illiteracy of black women was double the national average and that only one-third of black women went on to higher education compared to the general population. In 2015, unemployment among Afro women was more than double the national average. As a result, black women have been disproportionately impoverished; 9.7 percent of the general population lives in poverty, compared to 20.2 percent of Afro women (Telesur 2015).

In response to ongoing racism and discrimination, blacks again organized to fight for recognition. The most well-known organization, Mundo Afro (African World), successfully lobbied the government to gather data regarding the black population. Collected data showed that blacks' earnings were substantially lower than those of whites, that whites were twice as likely to have a university degree, that black unemployment rates were double those of whites, and that the number of blacks living in poverty was double that of whites. In response to this

overwhelming evidence of racial and social discrimination, the government introduced several programs to address the divide between whites and blacks. In 2013, the government passed legislation that requires schools to give more scholarships to Afro-Uruguayan students, reserves 8 percent of government jobs for qualified Uruguayans of African descent, gives tax breaks to private companies who hire Afro-Uruguayans, and mandates schools to include classes on Afro-Uruguayan history (O'Neill 2013).

One notable Afro contribution to Uruguayan life is music. Black percussion rhythms were combined with European sounds to create what is known as *candombe*. Candombe is now one of the most popular sounds at Carnival in Montevideo and is performed by both blacks and whites. The popularity of candombe and the continuity of racial inequality led to a National Day of Candombe, Afro-Uruguayan Culture, and Racial Equality, a day to reflect on the persistence of racial and social discrimination toward blacks (Andrews 2007–2015).

Energy and Climate Change

Uruguay has become a leader in the use of renewable energy. Starting in 2008, it mapped out a plan to lower its use of fossil fuels. It was on the brink of building a new gas pipeline with Argentina when the government agreed to commit to increasing its use of renewable energy sources. It imported wind turbines for wind power and photovoltaic panels for solar power. It also uses hydropower and biomass technology to round out its energy sources. By 2016, renewable sources made up 55 percent of Uruguay's total energy mix, and 95 percent of its electricity was obtained from renewable sources (Watts 2015). Growth of the renewable energy sector presents a new employment opportunity for women. Two solar photovoltaic companies partnered with job training institutes to train local residents in the assembly of solar photovoltaic projects. The program set a goal to have women constitute at least 40 percent of the total trainees, and it succeeded (Daley 2015).

V

Venezuela

Overview of Country

The Bolivarian Republic of Venezuela is a federal presidential republic of 23 states on the northern coast of South America. First colonized by the Spanish in 1522, Venezuela enjoys high levels of biodiversity—with the Andes Mountains in the west and the Amazon basin rain forest in the south. In 1811, Venezuela became the first Spanish American colony to declare independence, though freedom from Spanish hegemony was not fully secured until 1821 when Venezuela became part of the republic of Gran Colombia, which included the present-day countries of Colombia, Venezuela, Ecuador, Panama, northern Peru, Western Guyana, and northwest Brazil. Early 19th-century revolutionary hero Simón Bolívar (1783–1830) ruled Gran Colombia. After Venezuela became a fully independent state in 1830, it added the title of the Bolivarian Republic in honor of its former governor (Burkholder and Johnson 2015, 324). Throughout the 19th and early 20th centuries, Venezuela was ruled by military strongmen who hindered democratic representation and permitted gender discrimination throughout society. Since 1959, however, democratically elected governments have ruled Venezuela, though the nation's progress toward gender equality has been more protracted (Chasteen 2011, 318). In addition to its states, present-day Venezuela also claims the territorial

rights to the Guyanese territory west of the Essequibo River, an area stretching almost 62,000 square miles.

Venezuela has a hot and humid climate and has faced several environmental issues, especially deforestation, soil degradation, and urban pollution. The capital of Venezuela is Caracas, and the country is highly urbanized. The majority of the population self-identifies as mestizo (combined European and Amerindian descent), roughly 52 percent, and 44 percent self-identify as white and 3 percent as black (CIA 2015). Roughly 1 percent identify as indigenous. While the Wayúu civilization is the most prominent indigenous group within the country, the Venezuelan Constitution recognizes over 30 different indigenous civilizations and languages, though Spanish is the country's only official language (CIA 2015).

As measured by gross domestic product (GDP), Venezuela is the 34th-largest nation in the world. Since the Latin American colonial period (1490s–1820s), Venezuela has exported agricultural products such as cocoa and coffee. The country's largest export is oil. It surpassed Saudi Arabia in 2012 as the nation with the largest oil reserves (CIA 2015). Oil revenues have been used to finance state-sponsored programs to reduce poverty, particularly under the presidency of Hugo Chávez (1999–2013). Chávez's self-described program of "21st-century socialism" led to a decline in the poverty rate from 50 percent to 27 percent, decreased infant and child mortality, increased public school enrollment, and improved access to potable

water (Ciccariello-Maher 2013, 102). During Chávez's time in power, state initiatives in education, nutrition, health care, and sanitation were primarily financed through the nation's petroleum revenues.

However, since Chávez's rise to power in 1999, more than 1 million Venezuelans from predominantly upper- and middle-class homes emigrated. This emigration is largely attributed to the state's repressive political structure, lack of economic opportunities, high inflation rates, increased crime, and state corruption (Ciccariello-Maher 2013, 117). Venezuela is a frequent destination for immigrants, especially Colombian refugees. Since Chávez's election in 1999, Venezuela has had a tenuous relationship with some of the Western world, particularly the United States. The United States publicly criticized the Chávez administration and the current government of President Nicolás Maduro (2013–), who assumed the office as Chávez's handpicked successor following his death in March of 2013. Since the beginning of 2014, Maduro's government has faced consistent protests and civil unrest. Neighboring countries have expressed concern regarding the government's handling of the protests, and in December 2014, the United States began restricting travel to Venezuela, citing concerns over the pervasiveness of violent crime. In 2015, U.S. president Barack Obama declared Venezuela a national security threat (CIA 2015).

Overview of Women's Lives

As of 2013, the UN Gender Inequality Index (GII) ranked Venezuela 67th out of 187 nations (UNDP 2013). Although gender inequality and discrimination are persistent issues, the UN Committee on the Elimination of Discrimination against Women (2014) has praised Venezuela in recent years for its efforts to increase gender equality (UN Women Watch 2014). Despite some advances, Venezuela continues to grapple with problems of public female harassment, access to health care, concerns over the illegality of abortions, gender-based pay scales, and access to quality education for both girls in primary school and young women pursuing university degrees.

Girls and Teens

With respect to the average age of its citizens, Venezuela is a young country. Approximately 40 percent of Venezuelans are under the age of 17, and more than half of these young Venezuelans are female (UN Girls Education Initiative 2015). Despite the high percentage of girls and

teens, the nation has a high infant mortality rate (more than 15%), with rates being higher in rural areas (UNICEF 2015). Nearly 40 percent of girls and teens live in poverty, and roughly 20 percent of children under the age of five experience malnutrition (UNICEF 2015). Venezuela has also experienced problems over the past several decades concerning a lack of birth certificates for many children—leading to difficulties for children as they attempt to enroll in primary school (UN Girls Education Initiative 2015).

Literacy

Despite some of these challenges, girls and teens have enjoyed increased levels of literacy and school enrollment in recent decades. As recently as 2014, the UN Girls Education Initiative has praised the nation's gender parity in education and its increasing literacy levels. Since 2000, more girls have been enrolled in public schools than boys, and the adult female literacy rate has surpassed that of males over that period. In 2015, over 92 percent of girls and teens were enrolled in public school, and girls and teens have a literacy rate above the national average of roughly 93 percent. Increased levels of literacy have resulted in more female teens entering Venezuelan universities, which were made tuition free under Hugo Chávez's 1999 constitution (Humanium Association 2015).

Teen Beauty

Perhaps more than any other nation in Latin America, Venezuela has prized and accentuated the importance of beauty among female teens. The nation's emphasis on female beauty from a young age has given rise to a growing business of beauty academies in urban parts of Venezuela for middle- and upper-class girls. The *New York Times* often reports about the culture of teen beauty in Venezuela, citing the way the Ms. Venezuela Pageant has worked to captivate the minds of young women and their families (Forero 2005). During the 1990s and early 2000s, plastic surgery for teens became relatively commonplace for middle- and upper-class girls. These girls have cited pressures from their families and communities as well as state-derived conceptions of beauty as their primary motivations for surgical procedures (UNICEF 2015). One Venezuelan teen, Giselle Cesin, commented to the *New York Times* in 2005, "When I was 14, [my mom] repeatedly said, get a nose job, have liposuction, get your breasts worked on" (Forero 2005). The government has glamorized the winners of teen beauty pageants, and there is a financial

motivation for families to have their daughters compete in and win nationally sponsored pageants (UNICEF 2015).

Teen Sex Trafficking

Although numerous problems face young women, perhaps none are as severe or pervasive as human sex trafficking. Girls as young as 10 years old are often lured from poor interior regions of the country to the massive urban centers of Caracas, Maracaibo, and Valencia as well as Margarita Island to serve as sex slaves for wealthy patrons. These young women are often recruited through the promise of false job offers and promised that they will earn enough money to assist their impoverished families and communities. While some remain in Venezuela's urban centers, small boats take many to the Caribbean islands (especially Aruba, Curacao, Trinidad, and Tobago), where they work as sex slaves as well as domestic servants for wealthy families (U.S. Department of State 2013). It is not uncommon for girls to work as domestics and then be forced to serve in the sex trade after they are older.

The Venezuelan government has worked to issue anti-trafficking legislation, such as a comprehensive 2007 law on women's rights (CIA 2015). As with other Latin American nations facing problems of large-scale female human trafficking (such as Paraguay), the Venezuelan government has attempted an aggressive campaign of public service announcements to raise awareness of human trafficking and the false promises made to young women concerning job opportunities in large cities. In conjunction with these efforts, the state has issued legislation to protect children from entering into the informal labor force with the hope of reducing the number of girls lured from their local communities (U.S. Department of State 2013).

Child Abuse

Child abuse, particularly for girls, remains an endemic problem. Even though the state outlawed corporal punishment in public schools in 1998, it is an issue in many private homes. The state has deemed corporal punishment an acceptable practice for parents to use to discipline their children (Nicholas and Morse 2010, 214).

Education

Venezuela's Ministry of Education regulates the country's public school system and adult education programs. As of 2010, the country ranked 59th out of 128 countries

on the UN Education for All Development Index (UNESCO 2015). Only nine years of education are required by Venezuelan law. However, increasing numbers of girls and young women have finished high school and enrolled in universities over the last several decades.

Primary and Secondary Education

There are roughly an equal number of girls and boys enrolled primary and secondary schools—with both at roughly 93 percent (Humanium Association 2015). Under the presidency of Hugo Chávez, the state made increasing investments in preschool, which led to both higher enrollments for girls in primary school and, according to state tests, a greater level of student preparedness (Ministerio de Poder Popular para la Educación 2015). Most Venezuelan primary and secondary schools operate in shifts. Some students attend classes in the mornings until midafternoon and then a new group of students attends classes from the midafternoon until early evening. The state requires all public school children to wear government-issued uniforms. Uniform color varies by educational level. For example, students in primary school (first through sixth grade) wear white shirts, and students in early stages of secondary education (seventh through ninth grade) must wear blue shirts (Ministerio de Poder Popular para la Educación 2015).

Public schools have emphasized a diversified educational agenda. In addition to basic core classes in math, science, and reading, primary and secondary schools have mandatory English-language instruction, and individual schools must decide whether to offer classes on ethics or the Catholic religion. Students do not have a choice in their classes until they enter high school. Once in high school, students must decide to pursue either a science or a humanities track. Enrolling in classes in both disciplines is not permitted. As of 2014, there was roughly an even distribution of girls and boys on each track, though there were slightly more boys than girls pursuing science courses. The decision between science or humanities courses determines which majors a student is able to pursue at university. Beginning with Hugo Chávez's presidency and continuing under President Nicolás Maduro, the state has taken efforts to encourage girls in the ninth grade to opt for the science track, hoping to create gender parity in both science-related college majors and private-sector jobs (Ministerio de Poder Popular para la Educación 2015).

The government has also undertaken efforts to promote greater use of technology in public primary and secondary schools. Since 2001, the government has installed more than 2,000 new computer labs in public schools. The emphasis on greater technological knowledge and usage has also extended to the nation's teachers. Beginning in 2007, the Ministry of Education partnered with the University of Salamanca in Spain to create online portals where teachers can share learning resources and lesson plans (Global Resource and Information Dictionary 2015).

Although Venezuelan public education has been praised in recent years by international organizations, including UNICEF and the United Nations, many in the international community have voiced concerns regarding state interference in educational programs to promote state ideologies. In 2009, Hugo Chávez launched a Revolutionary Reading Plan that compelled students in secondary schools to read what the Venezuelan government termed “socialist ideologies” (Cole 2013). The director of the Ministry of Culture cited the state's desire to “eliminate capitalist thinking” through the Revolutionary Reading Plan.

In a recent study of Venezuelan textbooks conducted by the Associated Press, progovernment messages proliferated in school texts. The study reported that math problems contained fractions involving government food programs, and poems featured themes concerning the social improvements of the Chávez government. According to the Associated Press, the Venezuelan government has issued 5 million new textbooks since 2010 (Dreier 2015). A recent survey study by the Center of Reflection and Education Planning showed that almost 80 percent of Venezuelan families expressed concerns regarding the messages of the state's new textbooks (Infobae América 2014). Despite concerns over textbooks and educational programing, the government has reported large increases in literary and math scores among its primary and secondary school students over the last decade (Ministerio de Poder Popular para la Educación 2015).

University Education and Job Training

Venezuela has nearly 100 institutions of higher education. The university system currently receives 35 percent of the budget for the Ministry of Education despite less than one-quarter of the population pursuing a university degree. Higher education is free due to a provision in the 1999 constitution, and the number of women earning university degrees has risen dramatically since the new

constitution was approved (Ministerio para Educación Universitaria, Ciencia y Tecnología 2015). In April 2015, the Venezuelan minister of Women's Affairs, Andreína Tarazón, noted that 72 percent of university students are women (Información desde América Latina 2015). However, the majority of these women come from middle- and upper-class families. Despite the lack of tuition costs, many women from poor urban families and more secluded rural areas are unable to attend universities because their labor is needed to support their families' annual income. In an attempt to engender higher enrollment among youth from poorer communities, the state lessened entrance requirements to many of its universities and actively recruited students outside urban centers (Ministerio para Educación Universitaria, Ciencia y Tecnología 2015).

In addition to traditional universities, Venezuela offers many technical institutions of higher learning. As opposed to universities whose programs average five years of study, technical institutes generally offer three-year programs and have a higher percentage of male than female students (Ministerio para Educación Universitaria, Ciencia y Tecnología 2015). These schools have lower entrance standards than the country's traditional universities and are free of charge.

Health

Throughout most of Venezuela's history, the health care system had been one of the most advanced in Latin America. The nation has offered extensive inoculation programs and no-cost health care provided by the Venezuelan Institute of Social Security (Ministerio del Poder Popular para la Salud 2015). However, in recent decades, access to quality health care and preventative treatments have become harder to acquire, and there has been a general decline of the nation's health care system due to understaffing and underfunding (Lohman 2015).

Access to Health Care

Venezuela's health care system is in a state of crisis. Thousands of patients have complained that they cannot access essential medical treatments, and thousands more have been wait-listed for potential lifesaving surgeries. At the end of 2014, public hospitals were forced to wait-list approximately 20,000 patients scheduled for surgeries, including 4,000 at the University Hospital of Caracas. Doctors have also complained publicly about the difficulties

they face in securing proper medical equipment. Difficulties in obtaining quality health care have also led to increasing numbers of upper- and middle-class Venezuelans leaving the country (Lohman 2015).

The Venezuelan government, particularly President Nicolás Maduro, has blamed a pharmacy chain for “carrying out an economic war against the people” after it closed several registers at a main store in Caracas (Lohman 2015). However, many Venezuelans, the majority of whom are women, have been dissatisfied with the government’s response and have taken to the streets of Caracas to protest. Since February 2014, street protests have flooded Caracas, and many women have held signs and chanted phrases emphasizing their inability to provide health care to their children (UNICEF 2015). Many women have also noted on protest signs and through protest chants that the health care system functioned better for their families under former president Hugo Chávez (Lohman 2015). The protesters have put themselves in danger in recent months in the face of state efforts to remove them from the streets of the capital. President Barack Obama approved formal sanctions against Venezuela for state abuse and violence against the protesters (CIA 2015).

The changes in health care access in recent years have particularly affected women from rural areas of Venezuela. These women often lack the means to travel to major urban centers to receive basic treatments and preventative care. During the Chávez presidency, the government invested large sums of money into rural health care facilities and hospitals, but these have been the first to lose government funding in the wake of budget cuts (CIA 2015).

Maternal Health

Despite the current challenges with Venezuelan health care, infant mortality has steadily declined since 1999 (Ministerio del Poder Popular para la Salud 2015). Still, maternal mortality remains high, especially among teens. Venezuela currently has the highest rate of teen pregnancies in Latin America. This is due, in large part, to limited access to contraception across the country, a situation that has grown worse under Maduro’s presidency. Additionally, Venezuela has experienced high mortality rates among young mothers, which has resulted in an increasing number of orphans. To date, the country has approximately 500,000 orphans, and many have been surrendered to orphanages due to the death of their mother during labor (UNICEF 2015). The government has invested in programs for parental care

for mothers after birth and for single mothers. In addition to providing financial assistance in the form of subsidies, these programs have created centers for women to receive free child care products as well as counseling and consulting from trained child care professionals. However, these programs have been largely concentrated in urban centers and have not yet had an equal impact in rural areas (Ministerio del Poder Popular de la Mujer 2015).

Abortion

Abortion is illegal in Venezuela, except when a woman’s life is in danger. However, the majority of maternal deaths have occurred during illegal abortions (UNICEF 2015). Abortion is not legal in cases of rape, incest, fetal birth defects, or concerns over the economic situation of the family. Illegal abortions are dangerous, and the mortality rate for women between the ages of 12 and 50 account for almost 20 percent of all maternal deaths. This percentage is higher than the individual percentages for cancer, fatal accidents, suicides, or murders for women in that age range.

Many feminist organizations have claimed that the 20 percent figure is low and that the percentage of female deaths due to illegal abortions eclipses 30 percent (Pearson 2012). Women who are discovered by the state to have had an illegal abortion face a minimum of six months in prison. Some prison sentences exceed two years (CIA 2015). Several prominent feminist organizations have argued that access to illegal abortions (and sentencing for discovered abortions) is a class issue, disproportionately affecting poorer women, especially those outside of major urban centers. Feminist organizations, such as the Maracaibo Feminist League and the World Union of Christian Democratic Women, have been actively working to engage a public dialogue about abortions and the dangers of clandestine abortions in a culture that, they argue, has actively worked to silence the issue by characterizing the topic as a social taboo.

In the past several years, some Venezuelan politicians have presented bills attempting to decriminalize abortion. However, they have not received enough support in the national legislature to pass (Pearson 2012). Venezuelans’ reactions to abortion largely depend on age and religious affiliation. Recent research found that almost 40 percent of Venezuelans under 35 years of age support abortion. Although over 80 percent of Protestants oppose abortion, less than 60 percent of Catholics find abortion objectionable (HRW 2015).

Reproductive Rights

Access to affordable contraception is a recurring problem. A 2015 collapse in oil prices has made consumer products harder to find, including contraception. Many pharmacies in Caracas have reported being continually sold out of contraceptive products. Even government agencies and family health centers have reported shortages. Carlos Cabrera, the vice president of the Caracas-based branch of the International Planned Parenthood Federation (IPPF), suggested that the shortage of contraceptive care could lead to more female deaths from illegal abortions and a greater percentage of young women leaving school to enter the workforce as families struggle to afford basic commodities (Kurmanaev and Rosati 2015).

Diseases and Disorders

Although in recent decades the percentage of deaths of males due to infectious disease has declined, especially among Venezuelans aged 15–25, female deaths caused by disease have remained steady (Global Burden of Disease 2015). This is due in part to an increased HIV epidemic among girls within that age range, and estimates place the number of women over the age of 15 with HIV as high as 53,000 (WHO 2015). Some researches argue that the increase in HIV epidemics among young women within the last two decades is a direct result of sex trafficking and forced prostitution (Nicholas and Morse 2010, 138). Still, the percentage of adults with sexually transmitted diseases on the whole is small, and the majority of these diseases are treatable (WHO 2015). Other common diseases among males and females are yellow fever, cholera, malaria, typhoid, and hepatitis B (CDC 2015).

Venezuela has had issues in recent years with girls being born underweight (roughly 8%), and UNICEF has classified approximately 4 percent of girls born between 2008 and 2012 as being “moderately to severely” underweight (UNICEF 2015). Girls born underweight can face additional growth problems between birth and five years of age as a result of malnutrition, which is on the rise and is particularly a problem in rural centers (Global Burden of Disease 2015).

The Venezuelan government has launched awareness campaigns for many different diseases and epidemics, especially breast cancer. In addition to declaring October 19 Breast Cancer Prevention Day, the government offers free medical consultations and examinations for women as well as supplies and care packages for women undergoing

chemotherapy (Cutter 2014). The American Cancer Society has also collaborated with Venezuela and other Latin American countries to provide training and technical assistance to medical personnel within the country so they can more effectively treat women with breast cancer—which is responsible for approximately 15 percent of female deaths each year (Global Burden of Disease 2015).

Employment

The most recent iteration of the Venezuelan Constitution (1999) guarantees gender equality for men and women in the workplace. However, Venezuela ranks 71st in the Global Gender Inequality Index—well behind many other Latin American nations (World Economic Forum 2015). Although Venezuela has taken steps to promote equal pay for equal work and to encourage female entrepreneurs, women working in informal sectors of the economy (such as domestic labor) suffer gender discrimination with respect to pay and working conditions.

State Action in the Formal Economy

Since the 1990s, the percentage of women working in the economy’s formal sector has steadily risen due to continued efforts to increase their economic participation. Former president Hugo Chávez famously declared, “Without the true liberation of women, a full liberation of the people would be impossible. I am convinced that an authentic socialist ought to be an authentic feminist” (Motta 2013, 45–46). In 2001, Chávez created the Banco de la Mujer (Women’s Development Bank) to combat the feminization of poverty. The bank functions as a social development bank, offering women, especially entrepreneurs, low-interest loans called *microcredits*. The bank provides women with free administrative training to make them more competitive for higher-ranking positions as well as consultations to aid women in developing successful business projects. The bank does not have any branch offices, but rather relies on a network of promoters that make weekly visits to the most impoverished and densely populated communities across the country. Over its 14 years in operation, according to official government statistics, the bank has provided tens of thousands of women with financial capital and training to open up their own small businesses and be competitive for higher-ranking positions, which in turn has improved economic conditions for families and their local communities.

Despite the state's efforts and the bank's introduction, the U.S. State Department reported in 2008 that women earned, on average, 30 percent less than men, and college-educated women earned 17 percent less than their male counterparts (Wagner 2005). While the state has passed legislation designed to combat pay differences and worker treatment on the basis of gender, it has proven only partly effective in enforcing national and local labor laws due to an inefficient number of inspectors, low penalties for violators, declining budgets for inspections, and corruption (Nicholas and Morse 2010, 135).

Women's increased participation in the workforce and as business owners has affected family size. Since 2001, the average size of the Venezuelan family has steadily declined. Simultaneously, women have increasingly demanded child care. In addition to free child care provided by the state, more private firms have begun providing female employees and their families with this necessary care (Motta 2013, 42). The increased number of women working outside the home has also created a national dialogue regarding familial domestic responsibilities. Women continue to work, on average, 50 hours per week in the home, while men work roughly 10 hours per week (40). Feminist organizations and a number of national and local politicians have pushed for greater gender equality in family responsibilities, arguing that true labor equality cannot be achieved until it is present in both domestic and extra-domestic work (40).

Women in the Informal Economy

Even with efforts to increase women's economic participation in the formal economic sector, the Ministry of Labor acknowledges that approximately 50 percent of women labor in the informal economy, where violation of national labor laws and abuses are more common than jobs in the formal economy (Ministerio del Trabajo 2015). Women who are part of the informal economy generally occupy lower-paying jobs, have poorer working conditions, and receive no benefits. They typically work as food vendors, cooks, seamstresses, laundresses, and, increasingly, in the sex trade. The sex trade became prominent primarily as a result of men stationed in oil camps throughout the country. Venezuela is the second worst affected country by female trafficking in Latin America; only Panama has a higher rate of female trafficking (UNICEF 2015). Women working in the informal sector in general experience sexism more than those in the formal sector. These women have traditionally been called *muchachas* (girls) (Nicholas and Morse 2010,

138). Although almost 90 percent of women list themselves as "employed," roughly 50 percent work in the informal sector of the economy, where violation of national labor laws and abuses are more common than jobs in the formal economy (Ministerio del Trabajo 2015).

Family Life

Over the past several decades, the average size of the Venezuelan family has begun to shrink. The average family has three children, and the government expects this to decrease to two children in the coming years (UNICEF 2015). Although nuclear families have shrunk slightly, the importance of extended family remains critical. Extended families often reside in close geographic proximity, and the Venezuelan government has cited close family bonds as a key to community and national prosperity (UNICEF 2015). Several issues have emerged in recent years with respect to family life, notably marriage and LGBT rights, abortion and reproductive rights, and the gendered division of labor within the familial economy.

Marriage and LGBT Rights

The average marriage age for women is 23, slightly lower than that of males, which is 26 years. By law, females must be at least 14 years old to marry, and boys must be at least age 16 (Library of Congress 2015). With respect to marriage law, Venezuela does not recognize same-sex marriage. In 2003, the same-sex nongovernmental organization (NGO) Unión Afirmativa (Affirmative Union) submitted an appeal to the Venezuelan Supreme Court for legal recognition of economic rights (particularly pensions, inheritance, and social security) for same-sex couples. Economic, social, and cultural rights for same-sex couples are covered under the country's sexual and reproductive rights provisions and the law is interpreted to provide protection (Social Movement Ejército Emancipado 2016, 3; UT 2015, 2). A January 2015 lawsuit for the right to marry someone of the same sex failed before the Venezuelan Supreme Court. Research suggests that the majority of Venezuelans are in favor of the nation's ban on same-sex marriage. A 2013 Pew Research poll reported that fewer than 30 percent of Venezuelans supported same-sex unions (Pew Research Center 2014). Still, other Latin American nations have legally granted same-sex couples the right to marry—notably, Argentina, Brazil, Mexico, and Uruguay (Pew Research Center 2014).

LGBT activism has been prominent. Several LGBT grassroots organizations have petitioned the Venezuelan National Assembly to amend civil registry laws to allow the LGBT population to change gender identification on legal documents without a genital change. Although the National Assembly has created working groups to discuss issues of gender identification on official documents, they have remained resistant to the changes proposed by the LGBT community (Dutka 2015). The LGBT community continues to be active in Caracas. On June of 2015, the 15th annual pride week was held and witnessed numerous demonstrations advocating for equal treatment for LGBT Venezuelans under national laws (Dutka 2015).

The Familial Economy

To help offset the burden on families of both parents working outside the home, the Chávez government officially classified domestic work within one's family as a job and provided full-time mothers a government pension (Chew 2013). However, Venezuela's current economic climate has raised questions concerning the ability of only one parent to labor outside the home. As of May 2015, four of every five Venezuelan families cited an inability to afford basic staple foods. Roughly 80 percent of families throughout the nation report that they are unable to afford food, and almost 12 percent eat fewer than three meals per day (O'Brien 2015). High inflation has caused a decline in purchasing power and family savings, leading economists to question whether Venezuela can still be considered a middle-class country. Nuclear families have turned to extended family units for financial support during these difficult economic times, and many middle- and upper-class families have been leaving the country, as they did when Chávez assumed power in the late 1990s.

Politics

Women were granted the right to vote in 1946, which is consistent with the time frame for female suffrage across Latin America. Over 90 percent of women are registered to vote (slightly less than the 96% of males registered), and over 80 percent of registered female voters cast ballots in the 2012 election (International Institute for Democracy 2015a). Unlike other nearby countries (Argentina, Brazil, Bolivia, and Peru), voting is not compulsory; thus, these statistics reflect the body politics' strong engagement with national politics. Within recent decades, women have

assumed more and increasingly important positions in local and national politics, and there have been sustained efforts to promote national legislation related to women's issues and gender equality.

Participation in Government

Under Hugo Chávez's presidency, more women assumed positions in local and national government than ever before in the nation's history. For example, Chávez appointed a woman as head of the Supreme Court, the national economic commission, attorney general, national ombudsman, and deputy head of the National Assembly. He also had a female vice president, Adina Bastidas, between 2000 and 2002. His top lieutenant, Jacqueline Farias, famously declared, "This is a feminist revolution. It has opened a path for us" (Robertson 2013). As of 2014, women accounted for one-third of all government ministers. According to one NGO, in the two years prior to Chávez's election (1997–1998), women represented 6 percent of national lawmakers. Within a year of Chávez's presidency, that number rose to almost 20 percent. In March 2015, President Nicholas Maduro announced that, moving forward, women would account for at least 50 percent of all legislators elected to the Venezuelan National Assembly. The legislation was designed, in part, because women had secured a roughly equal percentage of seats in local legislative branches of government, but they had continued to be underrepresented at the national level (International Institute for Democracy 2015b).

Despite Maduro's efforts at legislative reform to increase the number of women in national government, many feminist organizations and grassroots movements have expressed concern about political rhetoric aimed at disparaging women and homosexuals. During the 2013 presidential race, for example, Maduro continually made insinuations about his political opponent Henrique Capriles Radonski because he had never married. In response to Maduro's charge that Capriles was a "little princess," implying that he is homosexual, Capriles called Maduro's wife ugly and declared that Maduro loved so many women he could not decide on an "appropriate wife" (Robertson 2013). Some political pundits argue that such disparaging rhetoric played a role in deciding the close election. Feminist political organizations, such as the Women's Social Christian Party, reasoned that such rhetoric distracts from policy issues and makes the climate harder for women to assume positions in national politics (Robertson 2013). Although Venezuela has

never had a female president, eight other Latin American nations have elected women to serve as head of state.

Legislation

In addition to ensuring more female participation in national and local government, Chávez increased the volume of legislation addressing women's issues and gender equality. Under his presidency, 70 percent of the beneficiaries of government programs were women, and in 2009, he created a Ministry for Women and Gender Equality. Chávez also worked to reform maternity leave. Under a new labor law issued in 2012, Venezuela extended maternity leave to 26 weeks (and 2 weeks paternity leave for men), making Venezuela's maternity leave the third-longest in the world, behind only Canada and Norway.

Recently, a number of grassroots organizations, with the support of national female legislators, have put forward over 50 proposals to President Maduro on a number of women's issues, especially female political representation, reproductive rights, and sexual and domestic violence. The grassroots organizers formed a congress in the capital city in which more than 2,500 women from a range of backgrounds, including rural workers, young professional women, indigenous women from the provinces, and university students participated. Although Venezuela still has work to do with respect to legislation protecting and supporting women, it appears the nation has taken important steps to foster dialogue and work for legislative reform (International Institute for Democracy 2015b).

In 2017, a government "super-body" created by Maduro to reinforce his authority, stripped the country's legislative body of its authority, deepening the country's political crisis. Dominated by a political party that opposes Maduro, the legislative assembly insisted on its authority to continue to meet and rejected this move as a blow to democracy (Graham-Harrison and López 2017).

Religious and Cultural Roles

Venezuela is a predominantly Catholic country because of the large social and political influence of the Catholic Church during the Spanish colonial period (1500s–1820s). According to the 2011 census, 88 percent of the population identifies as Christian, especially Roman Catholic (71%) and Protestant (17%). There are a growing number of other influential religious communities, particularly Muslim, Buddhist, and Jewish communities (Censo

Nacional 2011). Slightly less than 10 percent of the population self-identifies as having no religion, but even those that self-identify as religious cite religion as a less important factor in their lives. A Pew Research study from 2014, for example, found that only 10 percent of Catholics in Venezuela believed that religion played a significant role in their lives—the fourth-lowest percentage among Latin American Catholics, behind Uruguay, Chile, and Argentina (Pew Research Center 2014). The same poll, however, found that approximately 50 percent of Protestants feel their religious beliefs are a key part of their daily lives (Pew Research Center 2014).

Syncretism

While most Venezuelans classify themselves as practicing only one religion, the nation has a strong history of religious syncretism. Syncretism has produced new and burgeoning religious sects, such as that of Maria Lionza. Part of the Santería syncretic religion first developed in the Caribbean during the colonial period. Modern-day Maria Lionza blends African, Catholic, and indigenous religious beliefs into one core religion. The followers of Maria Lionza revere her as a goddess of peace, nature, love, and harmony. Lionza was born in 1502 to an Indian chief in the region of Yaracuy (one of Venezuela's 23 states). Oral tradition claims that Lionza still lives on the mountain of Sorte, where her followers visit to pay her homage. Due to the religion's growing influence, the government declared Sorte a national park and provided it with a government subsidy. Throughout the 20th century, Maria Lionza acquired followers throughout Venezuela, from distant rural villages to the capital city of Caracas, which features a large statue of her (Pollak-Eltz 1972, 20–30).

Celebrations

One of the most notable Venezuelan celebrations, and throughout much of Latin America, is a quinceañera (age 15). The quinceañera celebrates a young girl's transition from childhood to adulthood. The celebration traditionally begins with a religious ceremony and then a reception held at the family's home or a reception hall. It is customary for families to spend a significant amount of the familial budget on the girl's ball gown to be worn during the celebration (Latin American Studies 2015).

While several religious holidays are popular in Venezuela, arguably none are as meaningful as Christmas,

especially in Caracas. The festivities begin with mass and church services held annually on December 16, and they continue each morning until the final service on midnight of Christmas Eve, known throughout Latin America as *La Noche Buena*, the good night. During the Christmas holiday season, it is customary for women to make arepas, a fried corn pancake that is stuffed with different types of meats, vegetables, or seafood, for family and friends. Empanadas and hallaca, a traditional dish consisting of a corn batter containing various types of meat, vegetables, herbs, spices, and raisins that is then wrapped and steamed in banana leaves, are also popular during Christmastime and commonly made by women for their families (Morelock 2015). Dancing is popular during holidays and throughout the year, especially the folk dance Joropo—a couple's dance performed to music by traditional Latin American instruments, such as the cuatro (a small guitar) and maracas. Joropo blends Venezuela's indigenous, African, and European influences. Although salsa and merengue are primarily associated with the Caribbean, they are also popular in Venezuela, particularly Caracas (Morelock 2015).

Issues

Violence against Women

In 2007, the government issued a Fundamental Law on the Right of Women to Live Free of Violence. The law was the most comprehensive to date and prohibited 19 different forms of violence against women, including psychological violence, poverty-related and economic violence, and human trafficking (Ministerio del Poder Popular de la Mujer 2015). Still, in 2011, the state reported that there were over 150,000 complaints of violence against women, with roughly 50 percent pertaining to domestic violence. The government has begun retraining local police to better understand and handle domestic abuse cases and has initiated a public awareness campaign and national hotline for victims of domestic abuse. The hotline, created in 1999 under President Chávez, has grown considerably, receiving almost 11,000 calls in 2010 alone (Ministerio del Poder Popular de la Mujer 2015). Many feminist organizations, particularly the Maracaibo Feminist League, cite continued patterns of domestic abuse and argue that many cases go unreported (UNICEF 2015). The government's national awareness campaign has encouraged victims to report abuses and offered women free counseling and consultation (Ministerio del Poder Popular de la Mujer 2015).

Social Inequality

While income inequality remains a persistent problem, the situation has improved over the past decade. According to the UN Poverty Index, only 50 percent of Venezuelans were above the poverty line when Chávez assumed the presidency in 1999, but in 2011, more than 70 percent of Venezuelans were above the poverty line. In 2013, the United Nations reported that Venezuela had one of the lowest poverty rates per capita of any Latin American city. Unemployment also declined over that time, decreasing from 15 percent in 1999 to 8 percent in 2010 (UNDP 2013). While poverty and unemployment have decreased by 20 percent, crime has increased, especially the murder rate, which has risen approximately 50 percent since 1998 (UNICEF 2015). Some scholars argue that crime will continue to grow, believing that the government's efforts to reduce income inequality are not sustainable. They assert that although poverty rates have declined, the state has not done enough to improve individuals' capacity for wealth creation, a primary initiative of the Women's Development Bank (Global Resource and Information Dictionary 2015).

Poverty is especially felt among the nation's Afro-Venezuelan population, of which nearly 40 percent live below the poverty line (World Directory of Minorities and Indigenous Peoples 2015). Venezuela has also struggled with issues of racial discrimination and racial profiling, especially in more rural areas, where racial profiling against Afro-Venezuelans is rampant and police have been accused of using excessive force (World Directory of Minorities and Indigenous Peoples 2015). Indigenous Venezuelans, such as the Yanomami, have called for national investigations into police abuses in rural provinces. Through their national organization, Horonami, the Yanomami have attempted to raise awareness concerning labor discrimination and the state's unwillingness to enforce labor laws to protect against unequal pay and poor working conditions. Indigenous women working in the informal economy, such as domestic wage labor, are especially susceptible to labor abuses (Forest Peoples Programme 2012).

Venezuela's ability to successfully grapple with these issues and improve its citizens' lives remains to be seen. Grassroots organizing, especially among feminist organizations, has increased over the last decade, along with positive government responses to requests for greater equality. As Venezuela moves into the 21st century, it will continue to confront challenges regarding female beauty, human trafficking, violence against women, and income

inequality. How the state deals with these issues will not only affect the lives of its female citizens, but also the nation's ability to prosper.
